Public Comment: The Airports Authority and many of the commercial landowners would not support the "BRT/Rail Alternative" as noted above since their economic interests would simply not be met by this alternative. Likewise, because two-thirds of the trips to the key Tysons Corner employment center come from the west, the BRT system as the long-term solution west of Tysons does not serve the Dulles Corridor significantly more effectively than does the existing express bus system. (0088, 0211-M –4)

Public Comment: The BRT/Rail Alternative would not meet the needs of Dulles Airport as noted previously, and would not effectively meet the long term needs of the extensive business and residential areas in the Dulles Corridor west of Tysons Corner. Since nearly a very high percentage of the transit trips to Tysons Corner come from the west, this alternative would not adequately serve this ridership demand. There is reason for fear that if this option is put in place, rail to Dulles Airport could be delayed indefinitely, and possibly would never be built. The Airports Authority has made it quite clear that an option without rail to Dulles is unacceptable. (0204, 0204-M –4)

Public Comment: A combined BRT-metrorail system would discriminate against the western end of the corridor and force passengers to transfer from bus to rail at Tysons Corner. (0175, 0175-T –4)

Public Comment: In addition, BRT cannot serve Tysons Corner in any efficient way. A hybrid plan to extend rail to Tysons Corner and run BRT to Dulles is further flawed, since it incorporates no new Metro vehicle service facility. The facility at West Falls Church is already near capacity and it seems unlikely there would be room to store or service additional cars to run a Tysons loop and at the same time expand service on the Orange Line. (0186, 0186-T –4)

***Response**: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Support for Phased Implementation

Public Comment: I want to go on record as supporting Metrorail from West Falls Church, THROUGH Tysons Corner, then on to Dulles Airport and Loudoun County. However, I must admit that I'm concerned

that the funding won't be available to allow for its construction all at once. Therefore, I would suggest a modified phased implementation plan that would be tailored to correspond to the available funding levels. To begin attracting riders as soon as possible and get them accustomed to using transit in the corridor, the initial phase would be the expansion of express bus service in the corridor both to the Tysons Corner area and to West Falls Church Station. In conjunction with this phase would be the construction of surface facilities at the future Metrorail Station sites where parking and bus bays to serve the express buses would be provided as soon as possible. Unlike the BRT proposal, no special stations would proceed in stages as funding permits. The first phase would extend from West Falls Church to Tysons West as proposed in the phased alternative. However, rather than waiting until 2010 to open the remainder of the Rail system to Loudoun County (assuming availability of funding), I suggest opening segments beyond Tysons West in two or more phases to get the Metrorail service extended along the corridor as early as possible. The number of these operable segments and the actual implementation schedule would, of course, be dependent on the level of funding actually available. (0387, 0387-L –1)

Public Comment: We support the extension of public transportation through Tysons Corner, Reston and beyond. This is the Phased Implementation Alternative. (0010, 0010-E –1)

Public Comment: That said, our organization believes that practical matters, most notably financing, will dictate that more flexibility is needed in the locally preferred alternative to provide phased relief to the Dulles corridor's transportation needs in a rational and realistic timeframe. While the ultimate goal for the Fairfax County Chamber has been and remains Metrorail extension through Tysons Corner to Dulles International Airport and into Loudoun County, this goal cannot be accomplished in one fell swoop. Construction schedules for the massive project will require phased implementation due to logistical and funding issues. The Fairfax County Chamber suggests that the locally preferred alternative possess the necessary flexibility to allow for the provision of rail in the corridor as soon as practicable and greater enhanced transit opportunities above baseline improvement until rail can be provided. (0233, 0426-M –38)

Public Comment: I support the extension of rail in the Dulles Toll Road/Greenway Corridor. I also support an interim means of transit prior to the full build out of the rail system. This interim transit should be in some form of bus system whether it be an express bus system or a BRT type system. Maryland has been served well by the extension of rail service along many corridors outside of the Beltway and Virginia would likewise benefit. (0096, 0096-CC-1)

Public Comment: While we strongly support this project, the phased implementation option that will bring rail service from Falls Church to Dulles, we have some concerns. (0137, 0137-T –1)

Public Comment: Phased implementation of MetroRail underground (or cut & cover) such as T6. This would satisfy mitigation of much of noise concern by minimizing aerial. (0047, 0047-CC-1)

Public Comment: We strongly support this project - the Phased Implementation option that will bring rail service from Falls Church to Dulles. We would have preferred the so-called T-8 alternative that proposed main line, at-grade trackage with a circulation feeder system to serve Tysons, but that was dropped during the Alternatives Analysis - prematurely, in my view. (0137, 0224-M –1)

Public Comment: Immediately start BRT and/or more aggressively expand express and more flexible transit service in the Dulles corridor. Consider other short-term intermediate strategies to improve road and transit capacity, including private sector transit. View rail to Tysons Corner as a potential goal for 2010, thus creating an opportunity for funding from two Federal reauthorization cycles. Rail to Tysons West can be built for half the cost of rail to eastern Loudoun. Maintain BRT or express bus service between West Falls Church, Reston, and Dulles airport even after Tysons rail is in place to provide better transit travel time connections to Dulles and other jurisdictions. And five, extend rail beyond Tysons to Dulles and Eastern Loudoun after 2020, if transit support of land use patterns, proven rail demand and funding exists. (0446, 0146-T –14)

Public Comment: Immediately start BRT and/or more aggressively expand express and more flexible transit service in the Dulles corridor. Consider other short-term/ intermediate strategies to improve road and transit capacity including private sector transit. View rail to Tysons as a potential (but by no means certain) option by 2010, creating an opportunity for funding from two federal re-authorization cycles. Rail to Tysons West can be built for half the cost of rail to Eastern Loudoun. Maintain BRT or direct express bus service between West Falls Church, Reston and Dulles Airport even after Tysons rail is in place to provide better transit travel time connections to Dulles and outer jurisdictions. Extend rail beyond Tysons to Dulles and eastern Loudoun after 2020 if transit supportive land use patterns, proven rail demand and funding exist. (0446, 0218-M –15)

Public Comment: Historically, the Northern Virginia Transportation Alliance has been a strong supporter of upgraded transit in the Dulles Corridor. Its position has been to initially institute Bus Rapid Transit/expanded flexible transit in the corridor followed by some rail as densities, ridership and revenues increase. (0446, 0446-E –1)

Public Comment: We strongly support this project - the Phased Implementation option that will bring rail service from Falls Church to Dulles. (0137, 0176-L –1)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Need for More Enhanced Service

Public Comment: Greater, more enhanced transit service is needed in addition to baseline improvements to measurably address the short-term needs for the corridor. This is of particular importance in areas which will not be served by Metrorail in the immediate future. The locally preferred alternative should incorporate the expeditious provision of some form of enhanced transit service to mid and end of corridor areas to satisfy the community's interim transit needs and continue increasing the ridership base for the anticipated extension of Metrorail to the full length of the corridor. (0233, 0426-M –39)

> ***Response****: The Project Team recommends that the existing transit service provided by Fairfax and Loudoun Counties be further enhanced beyond the bus rapid transit elements that have already been added. Prior to the opening of the Wiehle Avenue Extension additional bus rapid transit elements—including the expansion of the Herndon-Monroe park-and-ride lot (site of the future Herndon-Monroe Metrorail Station), ITS enhancements, and facility improvements—should be advanced.*

Opposition to Phased Implementation

Public Comment: We do not support an interim BRT system as we are concerned over the additional cost to the ultimate project, considering that it would be in use for such a short term. We are also concerned about the effectiveness of the BRT proposal and the disruption during the change over to rail. (0027, 0027-L –2)

Public Comment: Do NOT understand the bus alternative? It won't work. It's the wrong path. Let's not detract from the real solution- which is rail. Money "wasted" on the bus alternative- is not then available for rail. The failure of BRT might prevent the success of metro rail. (0046, 0046-CC-4)

Public Comment: In the final analysis, I believe that it would be ultimately cheaper to build a rail line completely than start with a bus line and then later convert it to rail. (0004, 0004-L –2)

Public Comment: Phased implementation would waste resources and forfeit ridership while BRT operations are suspended during bus-to-rail station conversion. The rate of federal participation with BRT is only marginally higher than with rail. This increment does not justify settling for a transit system which does not meet our needs. (0175, 0202-L –3)

Public Comment: A plan to build BRT facilities and then convert them to metrorail in 10 years makes the capital cost for passengers for these BRT facilities prohibitively expensive. The resources would be far better spent on initial construction of metrorail facilities. (0186, 0186-T –3)

Public Comment: While I support the Dulles Corridor Rail Transit Project wholeheartedly, I can not at all support the Bus Rapid Transit interlude. It will be counterproductive adding to cost, disappointment and delay. (0013, 0013-L –1)

Public Comment: Why put money into buses for BRT if rail is the ultimate goal? (0078, 0078-CC-3)

Public Comment: With the "Phased Implementation Alternative", once again the BRT system would not serve the Dulles Corridor west of Tysons Corner significantly more effectively than the existing express bus system. The cost savings originally assumed to exist by building interim BRT stations and approaches that could then be readily converted to rail transit usage now appears to not exist. In fact, there would appear to be considerable disruption to the BRT system and a great deal of cost associated with converting the BRT phase to rail. Furthermore, there is substantial concern among the various affected community interests west of Tysons Corner that the eventual completion of the rail system to their stations could be delayed or postponed indefinitely. They want a guarantee that the full rail system will be built. (0088, 0211-M –5)

Public Comment: The Phased Implementation Alternative could eventually meet the airport and Dulles Corridor community needs. However, it too would very likely be unacceptable to the Airports Authority and the majority of the commercial real estate owners. Much of the BRT capital investment and operation is not readily convertible to a rail transit system without considerable expense and short term loss of operational effectiveness. Again, there is reason to fear that if this option is accepted, transit services from the west would really be little better than it is today and a full rail system to Dulles Airport might never be built. (0204, 0204-M –5)

Public Comment: If the phased implementation is used, what happens to the ridership during the lengthy process of making the changeover to rail? And just like the BRT-rail alternative, there's no assurance that the rail will ever be built. We are relying on future possibilities. Like in past years, rail may never be built. We would leave an inheritance to our children of what-ifs and should-have-beens, the same legacy of inaction that the people in the '60s left to us. (0204, 0247-T –3)

Public Comment: Phased implementation would waste resources and forfeit ridership while BRT operations are suspended during bus-to-rail station stop conversion. (0175, 0175-T –5)

Public Comment: BRT is widely seen as a threat to timely delivery of rail service in the corridor. We agree with what we frequently hear -- people do not believe that the "Phased Implementation Alternative" could actually result in the delivery of full rail service by the same date as the "Metrorail Alternative," as is assumed in the DEIS. The fact that it would cost five to ten percent more than the Metrorail Alternative almost inevitably means that the construction schedule would have to be drawn out if BRT was included in the Locally Preferred Alternative. We also know that there would be no real guarantee that, if the Phased Implementation Alternative is chosen, the completion of the rail system would not be delayed, for any number of now unforeseeable events. (0478, 0484-E –5)

Public Comment: Does not believe the phased implementation program recommended in the MIS Supplement is a good solution. That study was flawed and did not include proper public participation.

BRT will not work well enough to justify any expense. The present enhanced express bus service is working very well and is better for almost everyone concerned than BRT. (0013, 2-09)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *The BRT Alternative, as analyzed in the Draft EIS, would have remained in service as a permanent transit improvement, until replaced by Metrorail. Depending on the BRT alignment that would have been selected as the first stage of Phased Implementation, up to half of the capital cost for that stage would have been used to build facilities that would later have been converted to use for Metrorail. In addition, the BRT vehicles would have had significant remaining service life and could have been used for other projects in the region, or sold to another operator elsewhere in the country. Although BRT might have operated with a higher throughput capacity than typical 'express bus' services, it could not have matched Metrorail capacity.*

Opposition to the Metrorail Alternative or Proposed Alignments

Public Comment: While heavy rail is the optimal approach for the Dulles-to-Washington transit corridor, I do not believe that it represents the optimal solution to the transportation problem within Tysons Corner. Three of the proposed alignments, T-1, T-6, and T-9, offer only three or four stations to serve all of Tysons Corner. With these three alignments, it would be approximately a one-mile walk from the new Gannett USA Today building to the nearest heavy rail station. The loop alignment, T-4, would require that one-third of the riders with Tysons Corner destinations go all the way through Tysons, change trains and backtrack to their destinations. None of these is a good solution. (0178, 0178-T –2)

Public Comment: Imagine how terrific it would be to have efficient rail through Tysons Corner which dropped you off no more than a few blocks from your destination. None of the four proposed alignments would do that. (0178, 0178-T –4)

Public Comment: We must ask ourselves, what benefits will we get from rail? An easy trip to the museums in Washington or an easy commute to Washington to work for those few who still work in Washington, but is the price of three to four billion dollars worth it? Will we receive any tax benefits? No, and in fact the county will in all likelihood increase our property tax, and gain from the business taxes. Whereas the state of course, will obtain increased sales taxes, which very little if any will trickle down to Reston. Sadly, all we will really get is to have the privilege of paying for the toll road for another thirty years and a new tax district. Some benefits. (0189, 0201-L –4)

Public Comment: The alliance recommends the following approach: One, establish realistic expectations in terms of implementing and phasing a Locally Preferred Alternative. Do not adopt a rail-only strategy for which adequate funding is far from certain and might stand in the way of more immediate flexible and affordable solutions. Remember, no member of our congressional delegation has expressed optimism that the proposed total for Federal matching dollars is available in the next decade. (0446, 0146-T –13)

Public Comment: Spending 3 billion dollars to do something you could do for 3 million is ridiculous and irresponsible. (0294, 0294-E –4)

Public Comment: Construction of rail in the Dulles corridor will be Northern Virginia's most expensive transportation investment of the 21st century, greater than the Woodrow Wilson Bridge and mixing bowl combined. For the same cost, the region could implement BRT in the Dulles corridor, upgrade the Fairfax

County parkway, build the techway tri-county parkway, and regional bypasses to the east and west and improve Route 28. (0446, 0146-T –1)

Public Comment: For the same cost the region could implement Bus Rapid Transit (BRT) in the Dulles Corridor, upgrade the Fairfax County Parkway, build a Techway, Tri-County Parkway, and regional bypasses to the east and west and improve Route 28. (0446, 0218-M –1)

Public Comment: I believe that the decision about what to do for mass transit in the Northern Virginia area would require a careful weighing of the cost and benefits. And from what I have learned from reviewing the executive summary of the draft EIS, it appears to me that the rail system does not pass the test of the benefits justifying the cost. (0286, 0286-T –1)

Public Comment: In summary, a true Dulles Corridor Rapid Transit System needs to be more user friendly to residents and commuters who are not within close proximity to a station. Selecting an option with benefits only far in the future, highly prone to construction delays, with an extraordinary high cost which would necessarily crowd out the other transportation projects doesn't seem to be the best solution. (0233, 0426-M –30)

Public Comment: And the capital costs of the rail system are almost an order of magnitude larger than the BRT system, and therefore it's hard to get, in oral comments, into details. But, in summary, it doesn't seem to be worth it. (0286, 0286-T –2)

Public Comment: Second, they are convinced that someone other than themselves will pay for the bloated costs (thus qualifying as special interest advocates as we know from public choice theory), or three, they are going to share in the pork built into the $3.3 billion price tag. These are the same people who support Amtrak subsidies that have built up to $25 billion cumulative with no end in sight. In fact, the rail component west of Tysons is most accurately described as Amtrak to Dulles. (0162, 0162-T –3)

Public Comment: This is a terrible waste of money! I won't use it but will have to pay for it. Go with the cheaper bus proposal. (0457, 0457-L –1)

Public Comment: The metrorail options presented in the EIS, in our opinion, rely too heavily on inequitable and questionable funding sources, namely a tax district and increased tolls. In addition, the rail options create unsatisfactory aesthetic and access issues by being aboveground in Tysons Corner. Therefore, we support the lower cost transit alternative of BRT. (0139, 0139-T –9)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives and Metrorail Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Inability of BRT to Match Metrorail Service

Public Comment: In any event, such a busway will not be cost effective. With only six years of use for an investment of $350 million, the annual cost with six percent for opportunity cost, will be $73 million per year, $7.40 per passenger on top of operating costs. As noted on page 2 of this statement, the best suburban bus service cannot come to the productivity of similar suburban rail service. (0013, 0013-L –20)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further*

consideration after the public and interagency review and comment on the Draft EIS.

The BRT Alternative, as analyzed in the Draft EIS, could have remained in service as a permanent transit improvement. The Phased Implementation Alternative might have replaced BRT with Metrorail. Depending on the BRT alignment that might have been selected as the first stage of Phased Implementation, up to half of the capital cost for that stage would have been used to build facilities that would have later been converted to use for Metrorail. In addition, the BRT vehicles would have had significant remaining service life and could have been used for other projects in the region, or sold to another operator elsewhere in the country. Although BRT could have operated with a higher throughput capacity than typical 'express bus' services, it could not have matched Metrorail capacity in this corridor.

Support for Implementing Bus Improvements

Public Comment: Before embarking on any rail system, an express bus system should be tried at much less cost. Only if it is successful in meeting ridership to the point where users, not taxpayers, pay for its operation, should rail be examined (with the same test). (0299, 0299-E –2)

Public Comment: Many ideas that have been discussed and/or incorporated in the BRT alternative should be incorporated in an improved express bus system during the period of rail system development. These include pre-payment of fares to facilitate rapid boarding of buses at park-and-ride facilities and at West Falls Church and provision of real-time bus arrival and departure information at all major stops. These proposals can be incorporated into the existing express system without adopting any of the entire BRT options as defined in the DEIS. (0478, 0484-E –18)

Public Comment: This Express Bus service, that would be located on local roadways outside the Greenway Corridor, could be implemented in short order solving the incremental and interim need for transit prior to the arrival of Metro to the areas while minimizing the need for the demolition of the BRT facilities upon the extension of Metro service to the area. (0014, 0014-L –6)

Public Comment: Since Loudoun County has developed a realistic TOD land use program within its recently adopted Revised General Plan, the optimum transit alternative for the Dulles Greenway Corridor is the Metrorail Alternative in combination with the implementation of local Express Bus. (0014, 0014-L –5)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

BRT 3 was developed specifically to address the issue of convertibility of BRT to Metrorail service. BRT 3 would have had operating characteristics similar to the existing Express Bus, with the vehicles using the Dulles Connector Road, the Dulles International Airport Access Highway, the Dulles Toll Road, and the Dulles Greenway. Stops would have been located outside the Access Road/ Toll Road and Greenway rights-of-way. Local roadways would have been used to access these BRT stops. It would also have had features like payment before boarding.

This option could have been implemented in relatively short order and was designed to minimize the need to demolish or convert facilities.

However, BRT 3 did have some drawbacks. Because the buses would have had to leave the Dulles International Airport Access Highway to reach the stations, there was a need to provide multiple bus routes which would have been more expensive to operate, would have been more confusing for non-regular riders, and did not provide full corridor service. Also, buses on the Dulles Toll Road would not have achieved the same speed and frequency as buses using the

Dulles International Airport Access Highway alone. Finally, while little conversion was required, little of the infrastructure that would have been built for BRT 3 would have been usable for ultimate conversion to Metrorail.

Impacts of Tysons West Station

Public Comment: The necessary bus terminal at Tyson's West would be a great problem with little long term value and great short term disadvantage. (0013, 0013-L –23)

Public Comment: In addition, maybe the garage [at Tysons West] could be moved back from Rt. 7 so some offices/residences/restaurants could actually hide the garage from Rt. 7 and provide a better and more pedestrian-friendly environment around that station. (0071, 0071-CC-2)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station. The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

For Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.

The park-and-ride facility at Tysons West has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts. The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known. The park-and-ride would be accessed from local roads, and its cost is part of Wiehle Avenue Extension.

Phasing of Reston Stations

Public Comment: Phase in intermediate rail stations in Reston after rail is available to Dulles Airport and Tysons Corner. (0047, 0047-CC-3)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative (LPA). The LPA will be constructed in two phases, the first being from the Orange Line to Wiehle Avenue Station.*

Patronage estimates (the number of people expected to ride the system), are based on the station locations as shown in the drawings supporting the Final EIS, and these estimates are used to help determine if the project will qualify for Federal funding. Current estimates show a large number of people would ride from Reston to Tysons Corner, Arlington and the region's core. If intermediate stations were phased in, the patronage would need to be estimated again and it is likely that ridership for the project would decrease significantly. Lower ridership projections would result in lower measures of performance for the project that may make it less competitive for Federal funding.

The second issue with phasing the construction of the Reston stations is how the stations would be built after the system is operating. It is very costly to construct an 'in-fill' station once a Metrorail line is in operation. One could expect a doubling of the capital cost for an in-fill station.

Ability to Convert from Bus to Rail

Public Comment: Why is it so expensive and does it take so long to convert bus stations to rail stations? I know the stations are different, but a clever engineer ought to be able to design one which can be cheaply and rapidly converted, without $ excessive initial expense. (0041, 0041-CC-2)

> ***Response:*** *The BRT-to-Metrorail conversion process was described in Chapter 2 of the Draft EIS. The Project Team attempted several scenarios for the conversion; none allowed for safe and efficient construction and operation testing of Metrorail while the BRT stations remained in revenue service.*

Effects of Park-and-Ride Facilities on Traffic Flow at Tysons West Station

Public Comment: Concerned about placing a 2,000-car parking structure at the Tysons West Transit Station area. Particularly, the construction of the Locally Preferred Alternative in stages that would, for some period of time, have the Tysons West Station serve as a terminus point for the extended rail line from West Falls Church. This would cause the Tyco Road/Route 7 intersection to be overwhelmed by vehicular traffic that accesses Tysons Corner businesses and Tysons West Station. The combined impacts of the two distinct passenger groups would overwhelm this critical intersection even more than it is today. Believes that a commitment to timely reconstruct the intersection in a way that offers adequate access to all surrounding properties, including the TMS property and ensure that the intersection operates at a level-of-service E or better during the peak period hours of operation. (0135, 2-05)

Public Comment: Traffic at Tysons West will be a problem whether or not a Metro garage is built. The design team, county, and VDOT need to address the issue of access and traffic improvements at this location. (0387, 2-04)

> ***Response:*** *In response to public and interagency review and comment on the Draft EIS, the capacity of the park-and-ride structure at the Tysons West Station was reduced from 2,000 to 500 spaces. Further, the peak activity at the station will be early on weekday mornings and the park-and-ride structure will likely be full before the local peak hour of Tysons Corner. For instance, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m., while the local peak hour would be between 7:30 a.m. and 8:30 a.m.*

Route 772 Station Access and Facilities

Public Comment: It is apparent that the Route 606 station is planned to serve as the terminus station or major people-collector for the system on the western side. Based on the goals contained in the draft environmental impact statement and supporting information, good planning principles would dictate that the Route 772 station should serve that function as the true terminus station. As currently planned, the 606 station has the bus based kiss-and-rides and garage for 4000 spaces. The garage would be in addition to the 700 existing spaces at the Dulles north transit station. (0003, 0246-T –2)

Public Comment: I believe the following will clearly illustrate why the Route 772 station should be the true terminus station by including the massive parking currently planned for the Route 606 station. In addition to the Moorefield Station development, the Draft Environmental Impact Statement ("Draft EIS") indicates that Ashburn Village and Ashburn Farm will have more than 9,000 homes. Added to the Ashburn Farms and Ashburn Village projects are 11,000 homes planned for the Belmont, Broadlands, and Brambleton communities that expand the residential base and exponentially multiply the traffic. All of this planned development is located to the west of the Route 606 station. (0003, 0003-L –2)

Public Comment: By contrast, the 772 station will only have 176 kiss-and-ride spaces. Surrounding the Route 772 station is the planned mixed use development called Moorefield Station, which is currently being reviewed by Loudoun County. This project will have planned 4700 residential units and approximately 16.6 million square feet of nonresidential construction. Added to that, there is the 11,000

homes of Belmont, Broadlands and Brambleton, and 23,000 residents in Ashburn and Ashburn Farm. All of this is west of the Route 606 station. (0003, 0246-T –3)

Public Comment: The draft environmental impact statement had listed specific goals for all of the alternatives. By moving the planned parking garage to the 772 station and by doing so create a true terminus station, the following goals could be achieved:

Goal one. Improved transportation service. Travel time within the corridor and the region would be improved. The level of services in the DEIS have proved that.

Goal two. Increased transit ridership. The Route 772 station would capture the traffic from the populations of all the subdivisions and the Moorefield Station.

Goal three. Support future development. Accepted planning guidelines define that the transit station should be integrated into mixed use development such as the Moorefield station planned. There are no residential opportunities adjacent to the planned 606 station.

Goal four. Support environmental quality. Should the Route 606 station be developed with a 4000-car parking garage, the overall majority of cars destined for the garage will pass the Route 772 station, causing increased commuting times, increased commuting costs, and increased pollution. (0003, 0246-T –5)

Public Comment: Boston Properties believes that both Loudoun County and the various agencies associated with the Dulles Corridor Rapid Transit Project have the tools and the time to avoid the above-listed problems by making a logical and well planned decision to select the Route 772 station as the true terminus station. (0003, 0246-T –6)

Public Comment: We also would note that the DEIS does not include an option for facilities or pedestrian connections to the station in the Greenway median on both sides of the Route 772 station. A southside station or stop is recommended, in part, due to potential wetland and stream impacts. It is of the highest importance for the success of the Dulles Rail project that the Route 772 station is served by facilities on both the north and south sides of the Greenway. Functional pedestrian connections to the Route 772 station must be provided from both sides of the Greenway. As stated earlier, the Loudoun County Revised General Plan recommends a Transit Related Center (TRC) surround the Route 772 station. The area of the TRC extends to one-half mile from the station platform in all directions. It is appropriate to incorporate transit facilities and pedestrian connections into developments for both the north and south sides of the Greenway. (0014, 0014-L –8)

Public Comment: Major employment centers such as Beaumeade, America Online, WorldCom, and the residential communities of Ashburn and the Regency are located in the station vicinity. Feeder bus routes from these areas would be shorter, and would not traverse the Greenway interchanges, if transfer facilities were located on the north side of the station as planned at the Loudoun Station. Similarly, facilities on the south side of the Greenway could serve Moorefield Station and the mixed-use Brambleton development with shorter, more convenient feeder bus routes. (0014, 0014-L –12)

Public Comment: The planned rail station would be most viable when served by high-quality feeder bus, and "Kiss & Ride" on both the north and south sides of the Greenway at Route 772. (0014, 0014-L –13)

Public Comment: Please consider inclusion of an alternative for transit facilities and pedestrian connections for both the north and south sides of the Route 772 stop/station in the selection of the Locally Preferred Alternative and the Final Environmental Impact Statement and at a minimum please include a pedestrian access to the station from both sides of the Route 772 Station. (0014, 0014-L –14)

Public Comment: With specific regard to the Loudoun County stops/stations I believe it is critical that pedestrian and vehicular access be provided on both the North and South side of the Dulles Toll Road / Greenway. (0095, 0095-CC-2)

Public Comment: States that commuter parking should be provided at the Route 772 Station because it will be the terminal station. Assumption that all commuters from outlying areas will drive past Route 772 to Route 606 is not realistic. Believes that commuters will find a way to park at Route 772 Station whether parking facilities are provided or not, which will create a shortage of parking for employees, patrons, and residents of Loudoun Station. (0096, 2-02)

Public Comment: Comstock is working with developers and Loudoun County to help provide space for a commuter parking structure on the north side of the Dulles Greenway near the Route 772 Station. (0096, 2-03)

Public Comment: We urge Fairfax and Loudoun County to work together with VDOT and WMATA to plan effectively for adequate parking facilities. While we understand the desire to provide significant parking at the 606 station, we don't believe that this is adequate. The most logical point for people from Loudoun County is to stay away from the congestion which leaves the 772 station as the most desirable location. (0204, 0247-T –9)

Public Comment: Current WMATA plans provide for regional park-and-ride facilities in excess of 5000 spaces, including 750 existing spaces at the Route 606 station, which is not a terminal station. These are the only park-and-ride facilities in the current WMATA plans to be situated in all of Loudoun County. (0248, 0248-T –2)

Public Comment: Currently the WMATA design is constrained in making an objective study by Loudoun County's self-imposed prohibition contained in the countywide transportation plan which provides that "regional park-and-ride lots will not be located in the transit-oriented development." It appears at page 2-9, item 5. The DEIS shows clearly the consequence of failing to provide park-and-ride facilities at Route 772. Despite that, the Route 772 station is a terminal station, and so should have the greatest demand fro ridership. It will have less than one-third the ridership of the Route 606 station. Moreover, it shows that except if a full station is added in Tysons, what we will have is a terminal station with the lowest ridership of any station in the entire Dulles transit project. This proves what is intuitively obvious. If you do not build it, they will not come. (0248, 0248-T –3)

Public Comment: So compelling is the need for these structured park-and-ride facilities at the Route 772 terminal rail station that if the county were not to cause them to be built as part of the Dulles Corridor rail project, the County would need to build them itself at later date at a cost to the county of tens of millions of dollars. This is so because commuters living in Broadlands, Brambleton, West Winds, Ashburn Village, Ashburn Farms, Landsdowne, Belmont and many more communities even well beyond Leesburg will demand it, because it will become evident that the reliance on a single massive structured park-and-ride facility at the Route 606 rail station to serve most all Loudoun County and parts of West Virginia will not work. (0248, 0248-T –5)

Public Comment: As the report further shows, the park-and-ride facilities at Route 606 need to be drastically reduced to a surface parking lot. (0248, 0447-L –2)

Public Comment: Concerned about the amount of parking provided at Route 606 and the lack of parking provided at Route 772. Request that the parking at Route 606 and Route 772 be reanalyzed in the Final EIS. Request a copy of the unconstrained parking analysis done for Loudoun County by the Project Team. (0248, 2-02)

Public Comment: We actually have had a chance to study the EIS and we note that in the EIS statement there is actually not provision at the moment at the 772 station for access to the platform from both the north and the south sides of the Greenway. We believe that pedestrian access is really of utmost importance for efficient metro transportation. We understand during the EIS preparation time period that there was no development for the design staff to look at. We've had discussions with them and I think they see no problem with providing pedestrian access from both the north and the south side. (0256, 0256-T –3)

Public Comment: And so we would just simply like to say tonight simply that we would ask that in the final EIS statement that access be provided to the platform from both the north and the south sides. (0256, 0256-T –4)

Public Comment: A pedestrian bridge (urban deck) is critical at the 772 metro stop, especially if parking facilities are constructed on either or both sides of the Greenway. (0273, 0273-L –4)

Public Comment: Transit Connection: The construction of the overpass bridge over the Greenway and over the proposed rail platform is noted for construction by others. We suggest that the construction of the roadway to promote bus accessibility in the County's CTP is greatly enhanced with the bridge construction as part of the transit built solution (with rail) to establish linkage to the both sides of the Greenway. We envision the design similar to the local vehicle circulation at the Orange line Vienna Metro Station, as the Countywide Transportation envisions a four lane undivided collector road. The CMCF has proposed through the land use process to reserve land for the future road and construct the off-site connections from the Future Moorefield Boulevard to both Route 772 and Route 607/ Route 411 with provision of mass transit service. (0451, 0451-L –4)

Public Comment: A parking facility must be constructed at the 772 station in Loudoun County. This is the end station in Loudoun County. This is the end station and the station closest to the residential density in the county. It is unreasonable to expect commuters to drive to the Old Ox Metro station when the 772 metro stop is more conveniently located. (0273, 0273-L –3)

Public Comment: Strongly recommend a large parking garage be built at the final stop, 772. The garage should be large enough to provide parking for the 50K current Loudoun County residents already living in the area. No parking is a non-starter. (0090, 0090-CC-1)

Public Comment: Adequate structured parking must be planned at each station from the very beginning of the rail transit extension. All affected jurisdictions must work closely with VDRPT, VDOT and WMATA to plan effectively for adequate structured parking opportunities at all transit stations. Parking needs will vary from station to station. The Reston Town Center station and the Route 772 station in Loudoun County may serve primarily as destination stations with limited opportunity for long-term commuter parking. Nevertheless, the parking needs of these station areas must be given special attention. The language in the Loudoun County Comprehensive Plan that specifically prohibits transit related parking at the Route 772 station even though this station is the system's terminal station in Loudoun County particularly concerns me. While it is understandable that commercial, residential and public uses should be emphasized at this station, the total prohibition of transit-related structured parking at this location will prove detrimental to reasonable access to the transit system, and result in serious "bootleg" parking violations in the neighborhoods surrounding the station. (0088, 0211-M –14)

Public Comment: Parking At Route 772 and Reston Parkway Stations - Although I assume that it was an oversight, the Draft EIS showed no significant amount of parking at either the Route 772 or the Reston Parkway stations [for T6]. It is inconceivable to me that these two major stations in the Dulles Corridor would not require at least 2,000 parking spaces each, particularly given the rate at which Metro is adding new parking garages to its current stations. And whether it is due to an oversight or not, this omission should be corrected prior to the next step in this process. (0071, 0214-M –4)

Public Comment: We urge both affected jurisdictions to work closely with VDRPT and WMATA to plan effectively for adequate structured parking opportunities at all transit stations. Parking needs will vary from station to station. The Reston Town Center station and the Route 772 station in Loudoun County may serve primarily as destination stations with limited opportunity for long-term commuter parking. Nevertheless, the parking needs of these station areas must be given special attention. We are particularly concerned by the language in the Loudoun County Comprehensive Plan that specifically prohibits transit-related parking at the Route 772 station even though this station is the terminal station in Loudoun County. While we agree that commercial, residential and public uses should be emphasized at this station, we believe that the total prohibition of transit-related structured parking will prove detrimental

to reasonable access to the transit system, and result in serious "bootleg" parking violations in the neighborhoods surrounding the station. (0204, 0204-M –11)

Public Comment: Why is there no park and ride lot at the Route 772 station, which is at the end of the line? I decided to look up the Claude Moore Foundation Moorefield Station web site and discovered that they are only planning 205 parking spaces? Isn't it a little unprecedented for the end-of-the-line to not have a big park and ride lot? (0112, 0382-L –8)

Public Comment: We note that the transit station at Route 772 in Loudoun County has no parking associated with it and yet it is the last station on the line and significant new mixed-use development is being proposed around it. Further, ridership is projected to be only 1,400. We think that the parking issue should be revisited by Loudoun County. There might even be opportunities to provide satellite-parking facilities with the feeder bus service to this terminal station. (0141, 0443-E –12)

Public Comment: Enclosed is a copy of the Review of Dulles Corridor Rapid Transit Draft EIS by Gorove/Slade Associates, Inc. dated August 28, 2002. As the report shows, substantial structured park-and-ride facilities are essential at the Route 772 station on both sides of the Greenway. (0248, 0447-L –1)

Public Comment: Parking: The Claude Moore Charitable Foundation encourages flexibility of WMATA for the future station to consider additional parking consistent with the County's Zoning Ordinance or Comprehensive Plan at the Route 772 station, within the proposed land dedication. This would also increase boardings at this station. (0451, 0451-L –8)

Public Comment: The County has described the Route 772 area as a greenfield. The land immediately adjacent to the station is available. In fact 12 acres for transit use has been proferred by a zone applicant. This area, and possibly others, can provide the opportunity to locate a structured, regional park-and-ride facility at Route 772. (0248, 0248-T –4)

Public Comment: Concerned that the transit-oriented development at Route 772 would require significant amounts of parking at this station, especially since it is the end of the line. (0141, 2-02)

Public Comment: Access: We suggest that the Route 772 station include access to both the north and south sides of the Dulles Greenway via vehicular and pedestrian access to improve ridership projections. (0451, 0451-L –10)

Public Comment: Also out at Route 772, really there is no parking to speak of, and we really think, since that's the end of the line station, that the County ought to take another look and see if, at the very least, there couldn't be some satellite parking that could have feeder bus service that brings in people to the 772 station. Because now the EIS shows about 4500 people get on at 606 and only 1400 people out at 772, where you're going to have a major development facility. (0141, 0243-T –7)

Public Comment: And we have also made provision, should it become necessary, to accommodate a number of parking spaces. We recognize the discussion that was presented to you earlier about the 606. There is the possibility on the north side of the 772 station to accommodate some metro parking. (0256, 0256-T –2)

> ***Response:*** *As evaluated in the Supplemental Draft EIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team in cooperation with Loudoun County reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces. Loudoun County arranged with two owner/developers for the location of the two park-and-ride structures at Route 772 Station.*
>
> *The current station facility plans for the Route 772 Station are designed to integrate the station access points with proposed transit-oriented developments. They also include Kiss & Ride*

facilities and feeder bus facilities, and would capture a portion of travelers from the station service area and from the transit-oriented developments. Loudoun County recognizes that the Route 772 Station will function as a major intermodal facility among transit bus, shuttle bus and Metrorail. In fact, WMATA terms the bus-to-rail interface as the heart of the Metrorail system.

As indicated in the General Plans (Final EIS Volume V), construction of the proposed Dulles Greenway overpass is assumed to be by others. Although the Route 772 Station of the revised LPA includes station facilities on both sides of the Dulles Greenway, the Project has determined that transit-related use of this overpass would be limited. Other roadways shown are included in the phased implementation of adjacent developments as approved by Loudoun County. Station access will be the subject of continuing coordination with Loudoun County, property owners, and developers in station area.

The Project Team notes that the morning peak hour for access to the Route 606 Station with its 2,750 park-and-ride spaces will precede and peak traffic for access to adjoining and nearby developments. Based on the evidence of Metrorail system, the park-and-ride facility of Route 606 Station will be full by 7:30 a.m. and more likely earlier. Moreover, the two-hour peak periods of station ingress and egress will have an even distribution of vehicles without a defined surge, at times called the peak of the peak. Therefore, there should be no concerns of traffic congestion due to the Route 606 Station.

Route 606 Station

Public Comment: The Goals and Objectives of the Project are set out in the DEIS, at page 1-27. Goal 3, Support Future Development. By relocating the rail station away from where it was placed in the MIS, Goal 3 is greatly defeated. Millions of square feet of development stand to be made much less pedestrian friendly by moving the station more deeply into Dulles Airport. Also, at the MIS location, an entrance into the possible P&R lot adjoining Area #3 of Dulles Gateway can be readily provided. The DEIS location makes that impractical, if not impossible. This is vitally important, because the opportunity for over 1,000 surface spaces stands to be lost. (0284, 0447-L-4)

Public Comment: The Route 606 station location seems to have been moved away from the future TREC site apparently to save money on construction costs. This location would make it difficult to capture the kind of transit ridership that results from building directly adjacent or close to the rail transit station. There have been a many studies that demonstrate the importance of locating transit-oriented development adjacent to the stations. With increased ridership comes increased transit revenues and also increased land values and property taxes. We urge that the station be the moved closer to developable land. (0141, 0443-E –10)

Public Comment: We are also concerned about the location of the [Route 606] station. We feel it should be moved further to the west in order to enhance the transit-related development that was intended. Where it is now, it's closer to the parking garage. It should be moved closer to where you can have buildings that can provide direct access to the station. (0141, 0243-T –3)

Public Comment: Location of Route 606 Rail Station: We ask that the Route 606 station be relocated. Enclosed is a copy of the Dulles Gateway preliminary plan on which is drawn the Route 606 rail station in the location shown in the Draft EIS (dashed) and in its location identified in the Major Investment Study (solid), and the surrounding area. Highlighted in orange is the connection to the west side of the "MIS station." In yellow is the connection to the "DEIS station." The difference in walking distance from the west side of the adjoining property, Dulles Gateway, is approximately 1,100 feet greater for the DEIS location. Dulles Gateway is planned as one of two Transit Nodes in the Revised General Plan (the comprehensive plan for Loudoun County). The Draft Zoning Ordinance Amendment provides for a corresponding zoning district, PD-TREC (Transit Related Employment Center) permitting non-residential development at densities of up to a 2.0 floor area ratio. (0248, 0447-L –3)

Public Comment: There is no good reason not to restore it [Route 606 Station] to its previous location. Enclosed are two sheets of the profiles of the relevant section of line at and near the Route 606 station. We have had drawn on those profiles, the profiles for a station where it was located in the MIS. This drawing shows that restoring the station to its MIS location is not a major change. The grade difference is modest. For these reasons we believe it is very important that the location of the Route 606 station be restored to its location (MIS) as shown on the enclosed preliminary plan for the Dulles Gateway property from where it is shown in the DEIS. (0248, 0447-L –5)

Public Comment: Our second concern is that the Route 606 rail station has been moved from where it was located in the Major Investment Study. Where it is currently planned for the south and east into Dulles Airport, it is more distant for and less accessible to ridership demand. Were the station placed back to where it was in the MIS, ridership would be as much as 1,100 feet closer to the rail station. An examination of the cost difference shows it to be miniscule. (0248, 0248-T –6)

Public Comment: Requested that the Route 606 Station be relocated to the MIS location. Commenter is looking into the Project Team's response and will have an engineer validate the reasons why the Project Team says it should not be done. As currently located the station is more difficult to access and would be located farther away from the Transit-Related Employment Center (TREC). The station has been relocated to serve a preconceived parking location. (0248, 2-03)

Public Comment: States that the Project Team has misunderstood the request to move the Route 606 Station to mean that a second entrance would need to be constructed as part of the project costs. The commenter suggests that if the circumstances warranted, a second entrance could be constructed in the future, if the station was relocated, thereby providing access to the west. The current station design precludes access to the west. (0248, 2-04)

Public Comment: Request that the location of the Route 606 station be reanalyzed in the Final EIS. The commenter provided a sketch of Area 3, which is located approximately one-quarter mile of the Route 606 Station. An adjacent piece of property could be used as a park-and-ride to act very similar to the Herndon-Monroe Station. The Project Team dismissed this recommendation in the *Public Hearings Report*. (0248, 2-05)

Public Comment: Concerned that the Project Team does not understand that the area identified as Area 2 on a plan submitted to the public is part of the transit node, and that the Loudoun County Board of Supervisors added special language to the TREC policies to include this parcel. (0248, 2-06)

Public Comment: Area 2 would be within a half mile from the station if it were moved back to the MIS location. The commenter states that by suggesting shuttle buses, the Project Team has seriously underestimated the willingness of commuters to walk to rail rather than resort to a second mode of transportation. (0248, 2-07)

> ***Response:*** *Dulles Gateway Associates, L.L.C. and TAB I Associates, L.L.C., the owner and developer of undeveloped property to the north of the Route 606 Station and the Dulles Greenway, has commented on the Route 606 Station location, access and facilities during the two public comment periods for the Draft EIS and Supplemental Draft EIS and during several coordination meetings with the Project Team. In this Chapter 2 of Appendix J, his comments appear under the commenter identification number 0248 for the Draft EIS and its proposed General Plans (June 2002) and under number 0111 for the Supplemental Draft EIS and revised General Plans. For the comment period of the Draft EIS, the owner-developer submitted a February 3, 1994 plan titled "Transit Station Site 5-A, Dulles Toll Road Corridor". For the comment period of the Supplemental Draft EIS, the owner-developer submitted a technical report by his consultant, titled 'Route 606 Station and Parking Analysis' (December 2003), on alternatives for the Station's park-and-ride structure and other facilities.*
>
> *With his comments on the proposed General Plans (June 2002) the owner-developer submitted an undated development site plan titled "Dulles Gateway North, Sterling Virginia - Antigone*

Properties" prepared by Leo A Daly. The site plan shows two major developments that are separated by the stream valley and flood plain of Broad Run. Loudoun County in its revisions to its General Plan (County's name for its comprehensive land use plan) designates the area north of the Greenway, east of Broad Run and one-half mile north of the Route 606 station as appropriate for consideration of a transit node, Transit-Related Employment Center (TREC). Specific location of the TREC will be determined when a development proposal is made that complies with the policies and criteria specified in the plan. The owner-developer has not yet submitted his proposal to Loudoun County for review and approval. The owner-developer has identified the development east of Broad Run as Area 1 and west of Broad Run as Area 2. In addition, the owner-development has a land-locked parcel south of the Dulles Greenway and Broad Run and north of Route 606, which he has designated as Area 3. The route from Route 606 to the station facilities is via the existing Route 789.

Station Location

The location of the Route 606 Station in the final General Plans is west of the Route 606 overpass of the Dulles Greenway. The Greenway was planned, designed and constructed with a section of wide median to accommodate the future station. The Project Team's design in the final General Plans reveals that the width of median is not sufficient and, therefore, a westbound section of the Greenway must be moderately shifted outward from the median.

The Route 606 Station has its facilities of bus bays, Kiss & Ride and park-and-ride structure north of the Dulles Greenway on Airport property. North of the station facilities is the Area 1 TREC development.

The station location in the proposed General Plans (June 2002), revised General Plans (October 2003) and the final General Plans differs from the station location that DRPT had identified in its Dulles Corridor Transportation Study (June 1997). The study has been also known by its Federal definition, Major Investment Study or MIS. During the preparation of the proposed General Plans (June 2002), the Team shifted the station approximately 400 feet eastward or inbound from its MIS location for three reasons:

1) *to minimize the height and extent of Station's retaining walls and fill,*
2) *to avoid potential impacts to the existing Dulles Greenway bridges over Broad Run, and*
3) *to avoid impacts to the horizontal clearances between the eastbound lanes of the Dulles Greenway and the southern abutment of the Route 606.*

The owner-developer has consistently commented in the two public comment periods and requested in several coordination meetings with the Project Team that the Route 606 Station be restored to a location that he believes is the one identified in the MIS.

For the coordination meetings and for the Public Hearings Report (February 2004), the Project Team prepared Figure J.2-1 in order to depict the General Plans location versus the MIS location of the Route 606 Station. But, the MIS location differed from the location that the owner-developer believes is the one identified in the MIS. His location is approximately 700 feet further west or outbound from the General Plans location.

In the comparison of the General Plans and MIS locations of the Route 606 Station, the pedestrian bridge between the station and the station facilities (park-and-ride structure, bus bays, and Kiss & Ride) remains in the same location. The travel path from the platform to pedestrian bridge to the station facilities is aligned for extension to a proposed transit node and TREC. The Project Team will be coordinating with the owner-developer so that this pedestrian link will be efficient and attractive.

In his comments, the owner-developer has requested a shift of the station and a second pedestrian bridge and station entrance to serve the development west of Broad Run. WMATA and industry standards assume that one-quarter mile is a reasonable walking distance, and one-

half mile represents the outer limit of distance that most persons will choose to walk. Most of the Area 1 development is within one-half mile of the center of either the MIS or final General Plans station location, and could be accessed through the station facilities to the north (as noted above). Conversely, none of Area 2 development is within one-quarter mile of either platform location, and only a small portion is within one-half mile. The Project Team utilizes the WMATA study Development Related Ridership Survey II (December 1989) *as a reference for the determination of ridership by development type and distance. It revealed that the walk mode share decreases by 0.76 percent for each 100-foot increase in distance from the station. The additional rail transit trips by walk mode to and from the Area 2 development would, therefore, be negligible due to the prohibitively long walk distance.*

The sketch plan and profile submitted with the comments would move a large portion of the platform below grade, increasing construction costs, and increasing the distance from the platform to the mezzanine and pedestrian bridge level, which still must clear the Dulles Greenway below. Since the capital and operating costs of a second station entrance are significant and the additional ridership and revenues negligible, the Project Team declined this suggestion, as it previously did in a coordination meeting with the owner-developer. The economical solution for access from the Area 2 development west of Broad Run should be private shuttle buses, for which the Project Team would provide spaces at the station facilities.

Park-and-Ride Alternatives

The owner-developer in his comments on the Draft EIS and proposed General Plans encouraged the reduction of the 4,750 park-and-ride spaces at Route 606 Station. In the Supplemental Draft EIS, the Project Team proposed, later recommended, and the decision-makers selected a reduction to 2,750 spaces.

In his February 1994 plan and his December 2003 technical report, the owner-developer suggests that the Project Team consider the reduction of capital costs by the use of a surface park-and-ride facility in lieu of a structured one for the Route 606 Station. He also suggests the relocation and reconfiguration of the park-and-ride facilities by using Airport property north and south of the Dulles Greenway and using Area 3 of his ownership.

The Project Team discourages the separation of station facilities, particularly those of moderate size. If there were two park-and-ride facilities, totaling 2,000 spaces, a park-and-ride customer of Metrorail would not readily and conveniently reach one facility if the other became full first. The Project Team also discourages the separation of the station bus and Kiss & Ride facilities from the Area 1 TREC development, since there can be intermodal transfer and direct connections between the station facilities and the TREC development.

Interchange Modifications

The owner-developer has consistently commented in the two public comment periods and requested in several coordination meetings with the Project Team that the eastbound exit ramp of the interchange between the Dulles Greenway and Route 606 be modified in order to serve the alternative park-and-ride facilities south of the Greenway.

Through its travel demand forecasting and traffic analysis, the Project Team has shown that Project does not necessitate improvements to the interchange between the Dulles Greenway and Route 606. The traffic analysis in support of the Final EIS reveals that the intersection of Route 606 and Route 789 will degrade from Level of Service B in the current year to Level of Service F in the Project's forecast year of 2025, in the No-Build Alternative, that is, without the Project, due to the forecast land use. Level of service at an intersection is measured by the delay in seconds for drivers traversing the intersection. In the opening year of 2015 and in forecast year of 2025, the Full LPA increases the delay. The Project's mitigation for the opening year of 2015 is the addition of a right turn lane from southbound Route 789 to westbound Route 606. As shared with other stakeholders in the Dulles Corridor, the Project Team notes that the traffic conditions of station access should not be a major concern to the County nor to the owner-developer. The

peak activity at the station will be early on weekday mornings and the park-and-ride structure will likely be full before the local peak hour of local development. For instance, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m., while the local peak hour would be between 7:30 a.m. and 8:30 a.m.

The suggested modifications of the interchange are not in conformance with A Policy on Geometric Design of Highways and Streets (Green Book) of the American Association of State Highway and Transportation Officials (AASHTO). In particular, the modifications create an interchange between the Dulles Greenway and two crossroads and place a driveway on the eastbound exit ramp. An interchange with two crossroads (in this case, Route 606 and the development roadway) creates complex signing for the exit; moreover, the driver will have unconventional decision-points in a short length of travel. The presence of the ramp toll plaza worsens the signing, the line of sight to the decision-points and the inherent weave between the plaza and ramp terminal.

The driveway on the exit ramp violates the denial of access line established for this freeway by the owner of the Dulles Greenway. That denial of access is an integral element for safe and efficient operations of freeways.

While there are other reasons for eliminating this suggestion for modifications, one to add is that the driver, having exited the Dulles Greenway via the eastbound exit ramp and then the development roadway, will not have a clear understanding of the return to the Dulles Greenway. His orientation will be confused, unlike the exactness of the conventional exit maneuver to the primary crossroad, Route 606.

In the formulation of its Team recommendations (February and March 2004), the Project Team concluded, as it did in October and November 2002 Team recommendations, that it could not accommodate the suggested alternatives of the owner-developer.

Following the revising of the LPA and approval of the revised General Plans, the Project Team participated in a May 2004 meeting with the owner-developer, his consultants, a member of the Commonwealth Transportation Board, MWAA, TRIP II, and Loudoun County. The purpose of the meeting was to review the above issues with all interest parties. The meeting did not result in a change in the selected LPA and approved General Plans.

As stated in the final Team recommendations, the Team will continue to coordinate the pedestrian connections between the station facilities and the proposed development north of Route 606 Station.

Access Congestion at Route 606 Station Park-and-Ride Facility

Public Comment: Another concern is the recommendation to construct a 4,000-space parking garage immediately adjacent to the rail transit station. The size of this facility would severely congest the adjacent roadways. The amount of parking provided there should be significantly scaled back and provided in such a way that revenue producing mixed-uses are integrated into the parking and convenient shops and services provided for transit riders. (0141, 0443-E –11)

Public Comment: We are concerned about the 4000-space parking garage [at Route 606]. That's a huge thing. In this day and age, we think it should be scaled back, and certainly what parking remains should be integrated into the surrounding land use development. (0141, 0243-T –4)

Public Comment: While we understand the desire to provide significant parking for transit riders at the Route 606 station, we are greatly concerned that this single location cannot fully accommodate the very heavy parking demand that will result from focusing all Loudoun County commuter parking at this station. This situation will exist even with very significant improvements to the access at this interchange and to

Route 606. As strong advocates of Dulles Airport, we are troubled by the potential for very severe congestion impeding airport-oriented traffic and adjacent land use at this location. (0204, 0204-M –12)

Public Comment: A policy choice was made to provide significant parking for transit riders at the Route 606 station. I am greatly concerned, however, that this single location cannot fully accommodate the very heavy parking demand that will result from focusing all Loudoun County commuter parking at this station. A serious congestion problem will exist even with very significant improvements to the access at this interchange and to Route 606. I am troubled by the potential for very severe congestion impeding airport-oriented traffic and adjacent land uses at this location. (0088, 0211-M –15)

> ***Response****: As evaluated in the Supplemental Draft EIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team in cooperation with Loudoun County reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces. Loudoun County arranged with two owner/developers for the location of the two park-and-ride structures at Route 772 Station.*
>
> *Intersection LOS in the vicinity of the Route 606 station in 2025 will be F in both the No-Build Alternative and the Full LPA. The Project provides roadway improvements as mitigation measures. The location of the park-and-ride facility north of the station will not significantly change traffic congestion in the peak period. The park-and-ride facility at the Route 606 Station reflects transit demand as well as the Loudoun County Revised General Plan. Incorporating the facility into mixed-use developments would be based on county and developer initiatives.*

Request to Build Station at Hunter Mill

Public Comment: We realize that all of these ugly facilities have to go somewhere. So in the interests of fair play and equality of property rights between the government and private citizens, we would like to offer to build and operate a facility with up to 10,000 parking spaces for Metro or BRT, and to participate in paying for all or part of an additional Metro or BRT station at or near the Hunter Mill interchange. This could save tens of millions of tax dollars as compared to other proposed station locations, and provide much needed additional parking. As the owners of approximately 100 acres of largely undeveloped land at this interchange, we want to call your attention once again to the smart growth rail oriented development opportunity that exists here at this interchange. When combined with the adjacent 116 acre undeveloped tract and other undeveloped adjoining properties, approximately 250 acres could be planned and developed in a coordinated smart growth rail oriented urban village providing much needed affordable housing. Too often rail stations are located for political reasons where the existing adjacent development precludes a meaningful relationship between extending Metro and coordinating additional rail focused development. For example, a Hunter Mill Station provides a much better opportunity for smart growth than the Herndon/Monroe site that is adjacent to a wetlands and across the street from a significant amount of low density single family housing. The Hunter Mill interchange area provides an exciting opportunity to properly plan and focus Metro rail oriented smart growth, to obtain land for additional parking, and to close what would otherwise be a long gap in service between Tysons Corner and Reston. We would appreciate getting a number for the actual hard construction costs for either an additional Metro Station or an additional BRT Station. (0464, 0464-L –5)

Public Comment: Commenter states that the Dulles Corridor Land Use Task Force expressed preference for a station at Wiehle Avenue over Hunter Mill Road in an either/or situation, that does not preclude an additional station near Hunter Mill Road. Believes that the Land Use Task Force did not propose any land use changes because they were specifically instructed not to look at land uses east of the W&OD Trail. Suggests that a station at Hunter Mill Road would provide more parking, appropriate land, and better smart growth opportunities than the proposed station at Wiehle Avenue. (0464, 2-01)

> ***Response:*** *The process used for evaluating the initial list of alternatives for the Dulles Corridor Rapid Transit Project was a two-phase process: initial screening and intermediate screening. The process applied increasingly detailed and comprehensive measures of effectiveness to a*

decreasing number of alternatives. For the initial phase, most measures were qualitative. The alternatives advanced or carried forward for further evaluation at the end of each phase were those alternatives that best met the transportation needs of the corridor, relative to the other alternatives under consideration.

Control of the overall level of development in the Hunter Mill Road vicinity is under the jurisdiction of Fairfax County. Moreover, the locations of the proposed stations in the Mid-corridor section of the Dulles Corridor Rapid Transit Project are governed by and consistent with the Fairfax County Comprehensive Plan.

As explained in Chapter 2 and Appendix H of the Final EIS, during the early stages of the EIS process, a number of station alternatives were considered for the Dulles Corridor Rapid Transit Project, including a station at Hunter Mill Road. This station was eliminated from more detailed consideration in the Draft EIS because it would not be consistent with current or planned land use in the vicinity of the station. These reasons are explained fully in the Final Alternatives Analysis Report (May 2001). Some findings are summarized below.

Low-density land uses surrounding the proposed site would not generate enough ridership to support a station at this location. In addition, the citizens in the area expressed strong opposition to a station at Hunter Mill Road.

The Dulles Corridor Land Use Task Force, appointed by the Fairfax County Board of Supervisors, stated strong opposition to a station at Hunter Mill Road in lieu of the proposed station at Wiehle Avenue. The Task Force voted at its session on February 26, 2001 to endorse the elimination of the Hunter Mill Station and continued planning for the Wiehle Avenue Station. The Comprehensive Plan changes adopted by the Fairfax County Board of Supervisors on May 21, 2001 support this position; no transit-oriented land use plans have been adopted or considered for a proposed station in the vicinity of Hunter Mill Road.

Need to Reduce Number of Stations

Public Comment: In conclusion, I believe that the bus rapid transit proposals are vastly superior, but if the politicians really want to see fixed rail service in this corridor, I would urge WMATA to seriously consider killing some of the stations such as in Tysons, at Herndon-Monroe, Route 28 and the ones beyond Dulles Airport. (0112, 0269-M –9)

Response: *Many of the stations identified by the commenter for elimination are important sources of ridership in the corridor, and therefore are not appropriate candidates for elimination.*

Concern About Convenient Pedestrian Access

Public Comment: While the metro extension through Tysons benefits the region, the specific benefit to the new Gannett/USA TODAY headquarters, employing approximately 1,700 people is not certain. The proposed new Tysons stops actually may be farther from our new headquarters than the existing West Falls Church station. They are not within a reasonable walking distance. (0274, 0274-L –1)

Response: *The Project Team acknowledges that relatively few transit patrons would choose to walk between the Gannett/USA TODAY site and Tysons Corner Metrorail stations. For such large trip generators as Gannet/USA TODAY, there should be private shuttle buses that ferry transit patrons to and from the stations.*

Request for Passenger Amenities

Public Comment: Build restroom facilities into the new stations along the Dulles line. Passengers originating in Ashburn, for example, may be on board for well over an hour, including transfers, before reaching their destination. Arriving passengers will likewise have been inside the facility-less Metro

system for a long time. The added convenience for passengers will be well worth the small additional investment in custodial staff. (0290, 0290-L –6)

Public Comment: Public toilets at stations should be supervised and much more easily accessible. As population ages, this becomes even more critical. All public facilities have an obligation to protect the health, in addition to, the security of the public. (0441, 0441-E –10)

Response: *In November 2003, the WMATA Board of Directors today modified former the Metrorail restroom procedures for the public and implemented a variety of enhancements designed to protect customers and employees.*

- *In-station restrooms will be available to Metrorail paying customers upon request to the station manager if the customer has an emergency; if the request is made on behalf of a child; or if the customer is elderly or has a mobility requirement.*
- *Station managers have the right to refuse restroom use, at their discretion, if they feel their personal safety is at risk; or if there is an ongoing emergency on a train, in the station, or on the right-of-way requiring the station manager's immediate attention. Emergencies may include sick customers, station crowding, fare equipment collection issues, or a person on the tracks.*
- *If a station manager refuses restroom use on the basis they feel their personal safety is at risk, or if there is an ongoing station or train emergency, a report must be filed.*
- *Customers will be escorted to the locked ancillary door leading to the entrance to the restrooms. The station manager will unlock the door and direct the customer to the appropriate restroom.*
- *The station manager will return to his/her duties and allow the patron to exit himself/herself. Metrorail Station Facility Preparation*
- *Currently, all 83 Metrorail stations are equipped with a women's and men's restroom located behind ancillary doors in the stations. These individual rooms will be converted to restrooms for customers or for employees only. Additionally, all backroom locks, doors and cabinets will be modified as needed.*
- *Signs will be displayed at kiosks notifying customers of public restroom availability. The following four stations will not have restrooms available for customers for security reasons: Rhode Island Avenue, Addison Road-Seat Pleasant, Vienna/Fairfax-GMU and Pentagon.*
- *The revised operating procedures will be posted on the doors leading to the restrooms.*
- *There may be temporary closing of Metrorail station restrooms for a period of up to 30 days under certain specific security-related situations - when the national alert level is elevated or Orange or above; when a specific threat to rail systems is shared with Metro by the FBI, Federal Transit Administration, the Department of Homeland Security or other federal agency; or when domestic or worldwide terrorism or other related events warrant increased security vigilance.*

Need for Additional Vertical Circulation

Public Comment: More Escalators - The design drawings for most of the Metrorail stations in the Dulles corridor show two escalators and two stairways connecting each station's mezzanine to its platform [for T6]. As recent events within the current Metrorail system have indicated, having more than one escalator operating in each direction has a better chance of avoiding situations where passengers need to walk up or down due to escalator maintenance, planned or otherwise. Accordingly, I would suggest that the stairs planned for these stations be replaced with additional escalators. (0071, 0214-M –6)

Response*: Life safety codes require that, for emergency egress purposes, stairs be provided in addition to escalators. Stairs also provide increased flexibility for station circulation when used in conjunction with escalators.*

Need for Adequate and Reliable Vertical Circulation

Public Comment: We particularly appreciate plans for two elevators at each metro station in case one should become inoperable. We have experienced, and I have personally because I have a daughter who

uses a wheelchair, the difficulty when there is only one elevator that's out of commission at a metro station. Therefore, we feel that two elevators is an absolute necessity. (0259, 0259-T –2)

> ***Response**: Elevators are shown in the General Plans (Final EIS Volume V). Under the selected Metrorail Extension, all new stations would have two elevators serving each level: platform-mezzanine and mezzanine-street.*

Need for Station and Urban Design

Public Comment: The Reston Charrette demonstrated a high level of interest in making the stations more community-friendly through such means as holding an international design competition for the stations, attracting conveniently located services and facilities in and around the stations, and specialized training of staff for the stations with the objective of making the stations become community centers to the maximum feasible extent. Achievement of this objectives ties in well with all of the above recommendations, and can be achieved by adding this objective specifically to the scope of recommendations #3 [air-rights development plans] and #6 [strategies for reducing operating subsidies] and those below. (0478, 0484-E –21)

Public Comment: During the FEIS and rail PE process we need hard work on …Plans for making the stations more community-friendly through design competition, local control of operating policies, and training of staff. (0173, 0213-M –9)

Public Comment: I would also like to make the following suggestions: Every effort should be made to provide high quality stations with ample parking to help ensure that the stations are not only convenient, but attractive additions to the surrounding neighborhoods. (0393, 0393-L –3)

Public Comment: While offering my full support to the rail alternative, I do suggest the following considerations: Every effort should be made to provide the community with high quality stations that will offer not only convenient access to Metro but also an attractive addition to the surrounding neighborhoods. (0418, 0418-L –2)

Public Comment: The pedestrian bridges and stations, as shown for Reston in the Draft REI, are particularly ugly and will certainly be blight on the environment and lower property values below what they could be. As shown, they are particularly insensitive to the present environment and will instill no pride of ownership by the public. There is, consequently, a great probability that they would not withstand the test of time. I agree with others that the stations should be designed as the result of a proper design competition. (0441, 0441-E –12)

Public Comment: Local officials must play a far more effective pro-active role in anticipating the challenges and opportunities associated with the transit system. This is particularly true of the urban design planning needed for stations and the land areas directly adjacent to stations. Local officials must take a more proactive approach to urban design considerations and the planning of internal circulation systems associated with the transit-oriented development anticipated within transit station impact areas. It is appropriate to consider the general massing of structures and the layout of public spaces in the urban centers that will be created through the utilization of the transit system. Simply reacting to private sector proposals is not sufficient. Urban centers such as Tysons Corner, Reston, Herndon-Route 28, and the Route 772 center, will be very unique with the advent of rail service. They must be given local government attention that reflects their exceptional character. The traditional suburban two-dimensional, colors-on-a-map planning approach that has been used here to fore is not adequate to address the unique challenges of these urban activity centers. I challenge local officials to rise to this new opportunity to effectively guide development. It is already apparent that at several of the transit stations, especially the Reston Town Center and Route 772 stations, exclusive busways, light rail systems, or other internal circulation system must supplement a greatly improved pedestrian / bicycle network in order for these important activity centers to function effectively. This won't happen without a serious commitment of attention and financial resources by public officials. (0088, 0211-M –18)

Public Comment: Fostering structural and natural beauty are among Reston's founding principles. The transit-oriented development, necessary and desirable for rapid transit, will also create design challenges in maintaining Reston's beauty and creating a sense of one community north and south of the corridor. The Dulles Corridor Rapid Transit Project will involve massive construction operations in the near term and will foster development with a very high potential for significant increases in storm water runoff and other impacts. We emphasize these principles to County, developers, and other decision-makers now as the rail project is becoming a reality. RCA recommends that Low Impact Development and Green Building Design be incorporated into all plans for station area development. (0478, 0484-E –22)

Public Comment: I think in going forward toward the final EIS, we ought to have -- and this would require more of a delay, but we need significant community charettes, traffic demand and modeling out of this to maximize the number of pedestrian trips accessing transit from the new development that we get. There is still too much of a disconnect between land use and transportation here. I think it's going to take the design first, the appropriate traffic modeling of these pedestrian-oriented centers to make the additional density without increasing traffic congestion unduly. (0149, 0180-T –13)

Public Comment: Pedestrian bridges should also be designed to accommodate "Ponte Vecchio"-type commerce. (0441, 0441-E –7)

Public Comment: All stations & stops should have secure & rain protected bicycle parking located as close to station entrances as possible (closer than all car parking but possibly included in structured parking or within stations themselves). Station areas should be designed for safe on-road bike access [e.g., Bike lanes & ample sidewalks). (0066, 0066-CC-3)

Public Comment: Convenient, weather-protected, secure and ample bicycle parking should be provided at all stops and stations as close as possible to the stations. This could be ideally in covered parking, deck parking at the closest point in those structures near the stations, or within the station areas themselves. That really is an important feature of station design. If you want to get people to abandon their cars to get to the stations, and if they do that, they're more like to take transit rather than drive, you really have to make bicycle parking as convenient and time-saving as possible. (0066, 0254-T –8)

Public Comment: In Tysons Corner, the station design and function of the transit structure and facilities should be integrated into the transit-oriented development and should enhance and complement street frontages. (0387, 2-02)

Public Comment: Canopies for buses, taxis, bicycles, vehicle drop-off/ pick-up, and pedestrians, etc., should be integral with the entrance pavilions, which should be gracious entry/gateway places with various information and convenience commercial facilities. (0441, 0441-E –11)

> ***Response:*** *The land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. DRPT will work with the local government to support transit-oriented development initiatives, although implementation of this form of development is under the jurisdiction of the local government in the area.*
>
> *In the final General Plans, the station architecture of the Dulles Corridor Metrorail Project incorporates WMATA's "New Look" design that is now being completed for New York Avenue Station, and the two stations of the Largo Extension. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures. These are systemwide "signature" elements that support a unified system identity as well as economical design and construction. The project is expected to maintain a high level of design quality through the use of a special architectural consultant during preliminary engineering and final design.*

Station configurations do not preclude community facilities and functions separate from station facilities. WMATA is willing to consider clean retail businesses as part of the station facilities. The concept of a pedestrian bridge with retail business would have to be implemented as part of a joint development project; at this time, no specific provisions are planned to accommodate such development. The timeframe for addressing the technical issues is during preliminary engineering, which has recently commenced.

As indicated in the final General Plans, most of the canopies cited in the above comment are connected to or in close proximity to the entrance pavilions. Entrance pavilions would provide passenger information and space for newspaper vending equipment. All stations have bicycle racks and/or lockers adjacent to station entrances. However, none of these facilities are rain-protected. During final design, roadway widths, lane markings and sidewalk widths will be designed to address bicycle access.

Joint development projects at the stations are also subject to review by the local government through zoning and comprehensive planning procedures.

Public Comment: In conjunction with changes in land use, Dulles rail can reduce regional traffic. Most urgent, of course, is connecting the Orange Line to Tysons Corner and making Tysons work. This means creating the right mix of uses, including affordable housing and good pedestrian-oriented design. We can't simply drop the stations in the middle of Route 7. But it's going to be, if we do all these things, the best way to fix Tysons Corner congestion. (0149, 0180-T –7)

Response: *The Project Team agrees that the Dulles Corridor Rapid Transit Project would not solve traffic gridlock; however, it would provide an alternative to driving the automobile. While it is expected that increased density will result in localized traffic congestion in some of the station areas, the new transit-oriented urban form will help to increase the overall mobility in the corridor, counties, and the region, which would provide better walk and bicycle access within Tysons Corner.*

Need for More Ridership Forecast Detail

Public Comment: Provide more details on the results and methodology of the ridership forecasts that indicate that Metrorail patrons would not park at the West Falls Church Station to access the system. (0430, 2-01); (0520, 2-01); (0521, 2-01)

Response: *Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level. Nevertheless, the Project Team does not anticipate any increases in project-related cut-through traffic in the Westhampton neighborhood.*

Public Comment: Concerned that the May 2001 *Final Alternatives Analysis Report* is no longer valid because it ignores that transit ridership and benefits depend on high quality pedestrian access. (0494 2-05)

Travel demand forecasting models are typically not detailed enough to account for the quality of pedestrian linkages to a particular station. For the Draft EIS, the travel demand forecasting model reflects the presence or absence of pedestrian linkages at a particular station, but does not account for the quality of these linkages. Given that the model used for the detailed analysis presented in the Draft EIS does not reflect the effect of high-quality pedestrian access on transit ridership, earlier phases of the project would not be considered invalid because they do not account for these effects.

Public Comment: The EIS at a broad scale attempts to measure pedestrian trips tied to some of the density numbers, but I think it's at too high a level of modeling. (0149, 0180-T –11)

> ***Response:*** *The demand forecasting model used in the Final EIS utilizes an approach called a nested logit model. This model approach is a detailed method for first taking all person trips and distributing them between different modes (e.g. automobile, transit, other mode). The total person trips are modeled based on the number and density of residences in a geographic area called a Transportation Analysis Zone (TAZ). For transit trips the model then distributes trips between different modes of arrival (e.g. walk, auto, feeder bus). In assigning trips to a specific mode of arrival, the model considers total trip time, including time required to access the station by each mode, whether a walk access path exists, available parking, and available feeder bus service. This model is quite detailed and can be further fine-tuned by splitting the geographic analysis zones that are the foundation of the modeling process to more accurately reflect where people live and work within a densely developed area such as Tysons Corner.*

Uses of Future Wolf Trap Station

Public Comment: Believes that any other use for the proposed future station at Wolf Trap, other than a single-purpose station for events, is against project standards especially considering the area zoning, lack of road structure, and absence of commercial or high-density facilities. (0060, 2-01)

Public Comment: Would like to know the purpose of the possible future station at Wolf Trap. Would like to know if the current plans for grading for the future, estimated at $4.4 million, serve a full-service station as well as a single-purpose one? (0060, 2-02)

Public Comment: Believes that in the response to his comment in the *Public Hearings Report*, “park and ride layout and size” and “access roads” signifies an intent to establish a full-time use of the existing Dulles Access Road exit and entrance to Wolf Trap despite road signs to the contrary. (0060, 2-03)

> ***Response:*** *It is currently planned that, if constructed, the Wolf Trap Station would be a single-purpose station, used only for events at the Wolf Trap Farm Park for the Performing Arts.*

Need for Adequate Compensation

Public Comment: Commenter recently learned that his property would be taken as part of the north entrance pavilion for the Tysons Central C Station for the Locally Preferred Alternative. Believes that the company would receive little, if any, compensation and that he would not be able to find affordable property, or property that is zoned for a tire and auto store.(0493, 2-01)

> ***Response:*** *As discussed in Chapter 3 of the Final EIS, DRPT and FTA are required to meet certain standards for the fair and equitable treatment of persons and businesses displaced by federally supported actions. Relocation assistance will follow the guidelines set forth in Title 49, part 24 of the Code of Federal Regulations (49 CFR Part 24).)*

Relocation of Tysons Central C Station Entrance

Public Comment: Requesting that the location of the north entrance pavilion for the Tysons Central C station be moved from the Merchant’s property.(0493 01)

> ***Response:*** *The proposed location of the north entrance pavilion for the Tysons Central 123 Station was developed to be consistent with the transit-oriented development goals of Fairfax County and trackwork alignment geometry for the Metrorail Alternative.*

Request to Revise Responses

Public Comment: Would like the response to his original comment on pages 475 through 477 of the *Public Hearings Report* rewritten. (0494 2-06)

> ***Response:*** *The response presented in the Public Hearings Report is appropriate. However, the Project Team will continue to coordinate with the Reston Citizens Association regarding this issue.*

Public Comment: Requests that the responses to their recommendations on pages 49, 127, 157, 327, 329, 334, 358, 359, 421, and 474 of the *Public Hearings Report* be reviewed as a single set of recommendations for a more constructive response that would be helpful for project implementation. (0494 2-07)

> ***Response:*** *The Project Team did review these comments as a single set of recommendations. However, they were included in the Public Hearings Report under different subject headings.*

Public Comment: The Commenter would like to meet with the Project Team to discuss the above recommendations. (0494 2-08)

> ***Response:*** *The Project Team will continue to coordinate with the Reston Citizens Association on these issues.*

Need to Coordinate with Future Air Rights Development

Public Comment: Requests that the wording of the response to the "Air Rights Development Plans" on page 151 of the *Public Hearings Report* recognizes the need to perform early conceptual engineering work to assure that the recommended improvements in pedestrian access to stations is coordinated with prospective air rights development. (0494 2-09)

> ***Response:*** *With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*
>
> *Pedestrian walkways are provided from stations in the median of the highways to both roadsides.*

Need to Relocate Dulles Stop

Public Comment: The Dulles Airport stop was never sufficiently detailed. The stop is far away from the terminals, resulting in travel times greater than the existing Washington Flyer service. (0162, 2-08)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *The Dulles Airport Metrorail Station is shown in the final General Plans (Final EIS Volume V). This station will have a direct underground connection to the main terminal, and will have a special wide platform to provide plenty of space for passengers with luggage. Space has been allocated in this station for airport information, additional accessible fare gates, and luggage cart rental and return immediately adjacent to the station entrance.*

Need to Evaluate North-South Flow

Public Comment: No analysis done was done for traffic generated at the stations for north-south flow. (0162, 2-09)

> ***Response:*** *The impacts of congestion due to density bonuses are included in Chapter 9 of the Draft EIS and in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002. The overall level of development expected to occur as a result of the density bonuses in the transit station areas is discussed in Chapter 5 of the Draft EIS. The projected level of growth and related traffic and other effects were assessed. All neighborhoods within a half-mile of the transit stations were analyzed to see if they would experience an increase in cut-through traffic or other traffic impacts due not only to the construction of the transit alternatives, but also due, in part, to the increase in traffic associated with the development.*

Access to Stations

Public Comment: You may try to concentrate growth in the Dulles Corridor if you want, but how are people going to get to and from the stations? We do not have sidewalks, so people cannot walk, bike, roller blade, or jog. As long as people still take their cars between stations, home, and office, and as long as people still need cars to get to the grocery store, pharmacy, and baseball field, you have not really reduced congestion. (0007, 0007-E –2)

Public Comment: I strongly support greater emphasis on pedestrian and bicycle access to the stations. I think this is part of an overall urban plan that is needed and I'll go into that in a little bit more detail. (088, 0172-T –5)

Public Comment: In order for this project to be successful, there is a need for the improvement of intermodal connections and this calls for better pedestrian and bicycle access to the stations. A person living near a station could make auto-free trips if well designed trails, crosswalks and bike storage facilities are provided. (0158, 0475-L –6)

Public Comment: Planning for station access, especially for pedestrians and bikes is needed, as well as for a system of feeder buses to expand the transit-shed. (0158, 0475-L –7)

Public Comment: And we have a need to improve station access, especially for walking and biking. (0181, 0181-T –6)

Public Comment: Pedestrian and bicycle access is not yet adequately addressed. (0170, 0170-T –6)

Public Comment: During the final EIS and rail PE process, we need a lot of hard work, and I've got a list of nine things. One of the most important is improved grade upgrading, pedestrian access to stations from all four quadrants of all three of the Reston area stations, and that's been repeated over and over again by every major Reston organization. We need to allow safe access from all directions to the stations. A dense network of attractive and safe pedestrian and bike trails in the whole corridor area. 0173, 0173-T –6)

Public Comment: We believe that effective pedestrian and bicycle access to the transit stations is important in optimizing use of the rail system. (0204, 0247-T –6)

Public Comment: In addition to the two major transit-oriented developments planned adjacent to the platform, other nearby parcels are within the core or transition areas of the planned TRC District and need pedestrian friendly connections to the proposed Route 772 Metro stop. (0014, 0014-L –11)

Public Comment: All nearby pedestrian & bicycle facilities in the Fairfax Countywide Trails Plan (adopted 6-17-02)- including a "major regional trail" along all of the Dulles Airport Access & Toll Rd. and "major paved trails" along Sunset Hills Rd. & Sunrise Valley Dr and all other planned trails, sidewalks &

bikeways within 1/2 mile of all stations & stops should be constructed as an integral part of this project. (0066, 0066-CC-2)

Public Comment: As a board officer of Hunters Green Cluster, located equidistant from the planned Reston Pkwy. And Wiehle Ave. stations, we would be interested in knowing what our pedestrian access routes would be to those stations. (0078, 0078-CC-1)

Public Comment: While the changes occur, planning should include walkways and trails leading to all of the stations to make it easier for walking and biking commuters to use this transportation. (0098, 0098-E –4)

Public Comment: High quality pedestrian and bicycle access to all stations and stops is essential for maximum ridership. Detailed plans for all stations areas should include a comprehensive pedestrian network within one mile radii of the stations and a bikeway network consisting of on route bikeways and high quality shed use paths, within a five-mile radii. The W&OD Trail would provide excellent nonmotorized access in the Reston area, but a trail should also be built along the Dulles Access and Toll Road. (0066, 0254-T –5)

Public Comment: A major regional trail along the entire length of the Dulles Access and Toll Road is part of the Fairfax County comprehensive -- Fairfax County Trails Plan that was adopted by the Fairfax County Board of Supervisors on June 17th of this year. I would seriously consider building at least those portions of the trail that are adjacent to the -- in the vicinity of the transit stations as part of this project. (0066, 0254-T –6)

Public Comment: Also, bicycle access through parking lot locations needs to be carefully thought out and needs to be -- bicycle movement should be safe. Bike range is probably the way to do that, but most of the existing metro stations haven't really given much thought to that. (0066, 0254-T –7)

Public Comment: There are many pedestrian safety and bicycle safety effects that should be addressed. There are also some very positive effects that could be addressed, such as increased use of transit stations by bicycle and pedestrians; by enhancing the network that feeds into these stations. (0284, 0284-T –2)

Public Comment: I would really like bicycle access to be included in any solution. Bicycles greatly extend the reach for a person in a suburban environment, where density is comparatively low. (0076, 0076-CC-4)

Public Comment: During the FEIS and rail PE process we need hard work on…A dense network of attractive and safe pedestrian and bike trails in the corridor. (0173, 0213-M –4)

Public Comment: I strongly support strong emphasis upon effective pedestrian and bicycle access to rail stations.

Both Loudoun and Fairfax County planning officials and elected representatives must take responsibility in assuring that there is close coordination with the Virginia Department of Rail and Public Transportation (VDRPT), the Washington Metropolitan Area Transit Authority (WMATA) and the Virginia Department of Transportation (VDOT) to ensure that pedestrian and bicycle access to stations is not an afterthought in the development of land uses in the primary transit impact areas. A well thought out comprehensive access plan for each transit station is essential, particularly within the urban development centers adjacent to transit stations. (0088, 0211-M –10)

Public Comment: As someone living near Wiehle Avenue metro station, I would like to see trail signs installed throughout Reston trail system and bicycle storage facilities included at the metro stations to encourage pedestrian and bicycle usage. We would like a trail system similar to Reston's system and bicycle storage used throughout the Dulles Corridor Rapid Transit area. (0188, 0217-M –4) (0188, 0188-T –4)

Public Comment: Include pathways along the Toll Road between the stations. We can begin now to make the area more bicycle and pedestrian friendly. (0210,0210-M –7)

Public Comment: The attached station access recommendations referenced above, together with the Reston on Foot plan, provide a good starting point for the development of a plan for a transit station areas pedestrian and bike network. Fairfax County should work cooperatively with community organizations and property owners to develop such a plan. (0478, 0484-E –15)

Public Comment: Pedestrian and bicycle access is not yet adequately addressed. (0233, 0426-M –9)

Public Comment: Make adequate provision for pedestrian access to Tysons rail stations. (0392, 0392-L –6)

Public Comment: Pedestrian and bicycle access to stations: The description in the draft EIS of the plans to implement pedestrian and bicycle access to the stations is adequate. The EIS should be revised to describe the plans for pedestrian and bicycle access to each proposed station. The area considered should be at least a 3/4- to 1-mile radius from each station. The EIS should state more specifically how bicycles would be accommodated at the stations. If these needs and plans are incomplete at this time, the EIS should describe the process that will be used to identify the needs and develop these plans, including public participation. The EIS should state that pedestrian and bicycle access facilities would be paid for as part of each build alternative. (0392, 0392-L –8)

Public Comment: Compliance with Fairfax County Trails Plan: The EIS should describe how the Build Alternatives would affect and comply with the Fairfax County Trails Plan and what elements of the Plan must be implemented as part of the Build Alternatives. For example, the EIS should state whether the Scotts Run Stream Valley Trail would be completed in the vicinity of the Tysons East station as part of the rail alternatives. (0392, 0392-L –9)

Public Comment: While I realize the State DOT is in financial peril, the funds for this should come out of the project budget. These sidewalks will allow the pedestrians a much higher degree of safety. Our area [Westhampton] will have a large increase in vehicles attempting to get to the WFC Metro station-and sidewalks will be a big help in cutting down serious injuries. Too, speed humps, stop signs, sound barriers are all going to be necessary to appease the neighborhood. (0423, 0423-E –1)

Public Comment: Finally, if the [T4] Loop Option is adopted, our preference is that station access be provided on the East Side of International Drive, again because we feel it provides shorter and safer access to the residents who live here. (0395, 0395-L –3)

Public Comment: Access to stations: There must be auto and/or bus access to stations, depending on the station location. There was little discussion of this in the Draft EIS other than the proposal to construct a multi-level parking garage at the western end of Tysons Corner on Route 7. There must also be pedestrian and bicycle access to the stations to encourage people to walk or bike to the stations if possible. Rationale: It is a disincentive to ride transit if there is no feeder bus service to the stations, no parking at the stations or at park-and-ride lots, or no pedestrian/bike access. While these "amenities" are not the direct responsibility of VDRPT or WMATA to design and construct, they are essential elements of an efficient transit system. (0402, 0402-L –11)

Public Comment: Additional study is warranted at station locations to ensure the most appropriate design. (0413, 0413-L –3)

Public Comment: The Project team should show complete system planning approach for walkways and pedestrian access in addition to that provided to get riders from a drop off point to station. (0392, 2-01)

Public Comment: With all but the T4 alignment, the stations located along Routes 7 and 123 seem to be somewhat remote from the office and residential development north of Route 7 and west of 123. Thus,

the alternatives as proposed may not be reaching the full ridership potential. Furthermore, the rolling topography in this area does not appear to be all that conducive to walking. (0387, 0387-L –3)

Public Comment: Pedestrian Issues in Tysons Corner: Currently in Tysons Corner, it is very difficult, intimidating, and generally pedestrian-unfriendly for pedestrians and bicycles to cross Route 7 and Dolley Madison Boulevard/Chain Bridge Road. Construction of an elevated rail structure along these roads could increase this pedestrian problem. The EIS should be revised to describe how this issue would be addressed at the proposed rail stations and along the route of the elevated structure. The EIS should state where pedestrian bridges would be constructed between stations along Route 7 as part of the raised rail support structure or should at least describe how the design of the raised structure would accommodate pedestrian bridges in the future. (0392, 0392-L –15)

Public Comment: Access to the stations should be more comprehensive. There are not enough separate pedestrian, bicycle and "jitney" routes allowed for. In order to allow for this and future effective jitney service, the pedestrian bridges must be much wider and more space should be allowed for parking bicycles, scooters, etc. (0441, 0441-E –6)

Public Comment: Inasmuch as I and other residents nearest the proposed Wiehle Avenue station live south of the proposed station location, I was pleased to see the inclusion of means of direct pedestrian access to the Wiehle station from both the north side, where the Park and Ride facilities are located, and from the south side. I hope that this dual access means will be kept in the final plans. (0194, 0216-M –3) (0194, 0194-T –3)

Public Comment: Welcomes the project team's desire to ensure user-friendly access to Metro stations. States that recent surveys underline the fact that achieved ridership will be a function of access ease as well as journey time. (0133, 2-05)

> ***Response****: Station locations were identified and located based on proximity to residential, employment, and recreational locations, engineering constraints, and access. Ridership estimates were then developed based on these station locations. The demand forecasting model used to estimate ridership takes into account a number of factors when producing ridership estimates. These factors include overall trip time (including access to the station), station proximity to key employment concentrations, station proximity to residential concentrations, and ease of station access for pedestrians, autos, buses, and other modes.*
>
> *As described in Chapter 3 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the Metrorail stations. These plans are under the jurisdiction of local government, including the initiation of transit-oriented development around stations. DRPT will work with local government and developers that might be interested in developing transit-oriented development around stations.*
>
> *DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*
>
> *All stations will have bicycle racks and/or lockers adjacent to station entrances. Specific quantities will be determined as part of final design.*

Table 6.3-3 of the Final EIS describes the Project's park-and-ride program. The selected LPA is a Metrorail Extension that has the following park-and-ride capacities:

STATION	*SPACES*	*YEAR*
Tysons West	*500*	*2011*
Wiehle Avenue	*2,300*	*2011*
Herndon Monroe	*3,500*	*2015*
Route 28	*2,000*	*2015*
Route 606	*2,750*	*2015*
Route 772	*3,300*	*2015*
Total	***14,350***	***2015***

These park-and-ride facilities are in structures, as shown in the General Plans.

Each of the eleven Metrorail station has a pedestrian bridge or underground passageway that connects the station's mezzanine to the other side of the roadway or highway. The pedestrian bridges and stations are designed so that pedestrians may cross from one side of the roadway or highway to the other without entering the station proper and without paying a fare. However, it is anticipated that during the few hours that the station is not open, the entrances to the pedestrian bridges and vertical circulation devices would be secured due to security and vandalism concerns. Should the local government desire these bridges to remain open 24/7, WMATA, as the operator, may request that the local government be responsible for maintenance and operation of the entrance and pedestrian bridge facilities.

Construction of additional pedestrian bridges between stations is not within the scope of the Project. The Metrorail aerial guideway in Tysons Corner does not preclude construction of additional bridges by others; however, no specific provisions have been made to accommodate them. Nor are there plans to accommodate jitneys or other motor vehicles on the pedestrian bridges of the stations.

Need Mitigation to Address Congestion

Public Comment: The final EIS should more fully address mitigation tools to minimize the traffic congestion forecasts around stations. (0396, 0396-L –6)

Response: *Chapter 6 of the Final EIS discusses the traffic mitigation measures for the two Build Alternatives and station areas. Based on the traffic analysis, most of these mitigation measures would reduce the level of service and delay at some intersections to the levels forecast for the No-Build condition.*

Service to Tysons Corner

Public Comment: Adequately Serving Tysons Corner: The draft EIS does not describe how well the proposed rail alternatives serve the Tysons Corner area. The EIS should be revised to discuss this issue directly and completely. For example, the EIS should be revised to state the percentage of Tysons Corner workers that would be served by each rail alternative. The EIS should state why a one-half mile radius around the rail stations was used as walking distance instead of the more-standard 1600 feet. (0392, 0392-L –11)

Response: *Chapters 3, 5, 9, and 10 of the Final EIS present information on land use effects and the planned development at Metrorail stations throughout the Dulles Corridor. The population and employment levels within Tysons Corner station areas are presented in each of these chapters. As described in Chapter 5, the development effects in Tysons Corner are assessed for an area within 1,600 feet of the proposed stations.*

Parking Facility at Spring Hill Road Needed

Public Comment: For the station at Spring Hill Road I'm suggesting that to include a park & ride facility as part of station design. Since it is centrally located location. (0067, 0067-CC-1)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *A parking facility at Spring Hill Road had not been not included as part of the Draft EIS analysis because it had been anticipated that Spring Hill Road/Tysons West*Park would be an interim facility as part of Phased Implementation from BRT to BRT/Metrorail to Metrorail.*

24 Hour Parking Needed

Public Comment: Suggest design parking areas for vehicles legally able to park >24 hours, which is often required when traveling by air. Currently taking metro to National Airport is difficult since most people must drive to metro and cars are towed after 24 hours. (0079, 0079-CC-1)

> ***Response:*** *WMATA currently has some 24-hour parking for use by airport patrons at select Metrorail stations. Greenbelt, Huntington, and Franconia-Springfield each have between 15 and 17 spaces allocated for multi-day use and are available on a first-come, first-served basis. The potential for 24 hour parking at Dulles Corridor Metrorail stations may be considered. Possible disadvantages include the potential for airport patrons to use less expensive parking at rail stations instead of more expensive airport parking, thus denying parking capacity to daily transit riders.*

Parking Pricing to Limit Demand

Public Comment: A plan for parking and travel demand management that includes emphasis on rational parking pricing, to limit auto congestion and assure availability of parking spaces, integration of parking with mixed use transit-oriented development, and strategies for market rate private parking facilities. (0173, 0173-T –8)

> ***Response:*** *Transportation demand management (TDM) is a useful tool for dealing with issues related to transportation, land use, economic development, and environmental quality in an urban context. TDM can be used to manage the transportation system better, which would increase mobility, and reduce pollution. TDM can also be used to mitigate negative consequences of development, particularly increased traffic congestion and air pollution, while perhaps encouraging additional development to occur through the avoidance of traffic gridlock, if, when, and where TDM is implemented properly. The compact, mixed-use development planned for the station areas would enhance accessibility by transit, walking, and biking. Some employer-based TDM strategies, such as carpool/vanpool incentives, parking management, financial/time incentives, and information and marketing could also greatly reduce single occupant vehicle (SOV) traffic volumes.*

Public Comment: During the FEIS and rail PE process we need hard work on…A plan for parking and travel demand management that includes emphasis on rational parking pricing to limit auto congestion and assure availability of parking spaces, integration of parking with mixed-use transit-oriented development, and strategies for market-rate private parking facilities. (0173, 0213-M –6)

> ***Response:*** *Integration of parking with adjacent development will be the topic of continuing coordination with Fairfax and Loudoun counties, property owners, and developers. Both Fairfax and Loudoun counties have ongoing travel demand management programs that include car and vanpool assistance and employer assistance such as the Metrocheck program. Creating a*

parking policy that would use parking pricing to ration and minimize parking demand would require agreement among private parking operators, local and state governments, and regional entities such as the Metropolitan Council of Governments. Implementing such policy is beyond the scope of Dulles Corridor Rapid Transit Project, and as it was not in place at the time of the development of the Final EIS, it was not included in the ridership demand forecasting analysis.

Parking Access in Tysons Corner Area

Public Comment: There appears to be no easy access from Eastbound Route 7 to the Tyson's West Parking Garage. Is it just wistful to believe that most of the significant Eastbound traffic will instead elect to utilize rail- or is this "oversight" designed to discourage automobile traffic and push it to the Metro? (0041, 0041-CC-1)

Public Comment: The proposed Tysons west parking structure will just make the current Rt 7/ DTR intersection backups even worse. For a 2000+ space garage to work the Rt 7 bridge will need to be 4 lanes inbound and the DTR exits will need to be widened. The plan for the garage must include these road improvements- explore using Wolftrap instead. (0043, 0043-CC-3)

Public Comment: From the information presented in the Traffic Analysis and Stations Access Study, it's clear that the level of service at the Tyco Road/Route 7 intersection will be unacceptable at LOS F under all scenarios. The access to the station facilities will be severely compromised as a result. The location and/or design of these facilities should therefore be considered unacceptable as presented. It is incumbent upon the planning/design team to come up with a plan that addresses this access deficiency either by adding additional features, proposing additional road improvements or even possibly moving the surface facilities even if it means relocating the station platform if that's what it takes to address this problem. Addressing this issue becomes even more critical when a larger facility program, which actually meets the projected demand, is considered. (0387, 0387-L –43)

Public Comment: Moreover, providing parking for 2,000 cars next to the station will encourage additional traffic at the already congested intersection of Tyco Road and Route 7. This station, currently operating at a LOS F during the AM and PM peak periods, cannot accommodate the additional traffic associated with a large commuter parking garage. This fact is acknowledged in Section 14.3.1 of the "Traffic Analysis and Station Access Study-Technical Report" (the "Traffic Technical Report"), which indicates Tyco Road and Route 7/Leesburg Pike will operate at LOS F in 2025 under all of the alternatives considered. Importantly, the intersection functions work after the construction of the parking garage than it otherwise would under the Baseline (No-Build) alternative. We suggest that, before the Commonwealth selects a locally-preferred alternative that includes this massive garage, the Project Team should clarify the benefits to be achieved by constructing a parking garage that increases traffic congestion in an already-congested area. (0135, 0391-L –15)

Public Comment: The proposed Tyson's West parking structure will just make the current Route 7-Dulles Toll Road intersection backups even worse. For a 2,000-plus space garage to work, the Route 7 bridge will need to be four lanes inbound, and the Dulles Toll Road exits will need to be widened. The plan for the garage must include these road improvements. I would suggest exploring using the Wolf Trap parking instead. (0043, 0276-T –3)

Public Comment: I am also against putting huge parking structures up at Tysons West - unaesthetic, congestive, likely to crowd & creates more traffic. Horrible idea, unless it's underground. (0030, 0030-CC-4)

***Response*:** *The park-and-ride at Tysons West Station has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts. The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known. The park-and-ride would be accessed from local roads, and its cost is part of Wiehle Avenue Extension.*

Restricted Access to Herndon-Monroe Parking

Public Comment: Is there a plan to restrict the parking (new) at Herndon Monroe to Toll Access only or is the plan to allow entry from the toll with exit to Sunrise Valley. During the discussion on the original garage we were told that only 700 or so spaces would be accessed from Sunrise with the rest accessed by the Toll Rd. Those vehicle that entered from the Toll Rd. were to be required to exit back on to the Toll Rd. (Westbound) that lasted less than one year. (0081, 0081-CC-1)

> ***Response*****:** *As configured in the General Plans, all sections of the park-and-ride can be accessed by all vehicles. Policy regarding limited access to Sunrise Valley Drive would be under the authority of Fairfax County. However, limits on ingress and egress could have negative effects on patronage for the project.*

Public Comment: Create access to parking garage from the West bound toll road - eliminate traffic on Sunrise Valley Drive. (0075, 0075-CC-5)

Public Comment: Take a serious look at the development plan for the Herndon-Monroe Park & Ride. Access from the north side of the Toll/Access Road is a necessity. Eventually a parking garage should be built on the northside. (0075, 0075-CC-3)

Public Comment: Build access to east and west bound toll road for passengers leaving the HM parking garage. (0075, 0075-CC-6)

> ***Response:*** *Access to the Herndon-Monroe facility from north of the Dulles Toll Road is already adequate, with a number of alternative means of crossing the Dulles Toll Road in the vicinity of the Park-and-Ride, including Fairfax County Parkway, Monroe Street and Centreville Road. The limited number of vehicles that would use an additional direct connection from the westbound Dulles Toll Road to the Herndon-Monroe Park-and-Ride facility would not significantly reduce the current traffic volumes using the access on Sunrise Valley Drive.*
>
> *Parking at each Metrorail station was designed and sized based on projected demand for spaces, site constraints, and cost. Consultation with local government was also an integral part of the sizing of parking facilities.*

Tysons Central 123 Station

Public Comment: Each of the rail options shows a five-way bus transfer center at the parking terrace D located along the internal ring road adjacent to Route 123, between Lord & Taylor and Hecht's. As noted above, we are currently providing bus stops in the mall and we are open to discussing an enhanced role for such facilities as part of the center's continued development. (0143, 0143-T –2)

Public Comment: However, we have certain issues and items that we would like to bring to your attention tonight and to discuss with WMATA in greater detail before the Commonwealth selects an ultimate alternative. Number one is parking. I noted that the proposed bus transfer station is located abutting a parking structure that serves the Tysons Corner Center mall currently along the ring road. It is not a WMATA garage, it is not another public entity's garage, it is in fact a private facility constructed to serve and does serve the property owners' business interests and those of its tenants. Moreover, we depend on the availability of those spaces to serve our customers and employees. We are concerned, however, that making the Tysons Corner Center a de facto park-and-ride facility by locating a bus transfer station abutting this parking structure represents a potential unintended consequence for the rail system. We encourage WMATA to respond to this issue as part of its ongoing study, and we offer our time and assistance in your doing so. (0143, 0143-T –3)

Public Comment: Related to the potential impacts of this parking situation, the location of the bridge platform next to the parking structure, we also think it has the potential to impact development and redevelopment of the areas immediately adjacent to the rail station and the bus transfer facility. We

encourage the Commonwealth and WMATA to select designs that permit and encourage redevelopment and development of pedestrian-friendly, transit-oriented development within walking distance of this bus and rail station. (0143, 0143-T –4)

Public Comment: I note that the parking structure where the bus transfer facility is proposed to be located represents the closest underdeveloped area adjacent to the station. We need to make sure that we have the flexibility both working with you and in the ongoing future to design redevelopment in the bus transfer station in ways that facilitate and complement each other, not preclude one another. (0143, 0143-T –5)

Public Comment: Finally, I would note that circulation concerns remain an issue that we would like to work through with WMATA. We have concerns in particular about the circulation patterns for the buses accessing this proposed bus transfer facility. The design overlay included as part of the DEIS highlights the potential conflicts of buses making left turn lanes as they seek to re-enter the internal ring road within the Tysons Corner Center. We hope and intend to work with WMATA's staff and the Commonwealth to learn more about the potential circulation issues as it relates to this facility and to minimize the effect both on the mall property as well as service within the Tysons Corner area. (0143, 0143-T –7)

Public Comment: Each of the rail options for the Tysons Central station includes a 5-bay bus transfer station abutting Parking Terrace D of the Center located along the private, internal ring road adjacent to Route 123 and between the Lord & Taylor and Hecht's department stores. It appears from the DEIS exhibits and from our meetings with the Project Team that this bus transfer station would be constructed in an area that already is improved with a parking structure, surface parking spaces and the private internal ring road servicing the Center. We also understand that the bus transfer station would be linked to the rail platform via a pedestrian bridge across Route 123. We are concerned about the location of this bus transfer station along he narrow, private ring road of the Center and abutting the parking structure. That area of the Center is a major entry and exit point for customers and employees accessing the Center from Tysons Boulevard and Chain Bridge Road/Route 123. This is especially true during the holiday shopping months of November and December, when the local police officers are used to direct and manage the flow of traffic through the area. The narrow passageways and tight turns of the private ring road and parking structures also represent substantial circulation and access challenges for buses and passenger vehicles traveling in opposite directions. The introduction of additional bus activity in an already congested area of a private street that the Owners constructed and continue to maintain at their expense, will have a substantial effect on the Center's operation and imposes undue public burdens on a developed commercial property that is arguably the centerpiece of Tysons Corner. We support the need for and construction of appropriate pedestrian access to and from the Center and the Tysons Central transit station; such a connection is vital to ensuring the proposed transit system functions as intended and desired. We do not support, however, constructing a major, new bus transfer station in an already-developed area that has established and unique circulation patterns. (0406, 0406-L –3)

Public Comment: We suggest that the Project Team consider locating the bus transfer station across Route 123 on the undeveloped parcels located between Galleria Drive and Route 123 west of Tysons Boulevard and east of International Drive. That location is conveniently adjacent to the proposed Tysons Central rail platform and provides improved ingress/egress opportunities to the service areas of the buses that will utilize the proposed bus transfer station. Indeed based on our review of the "Transit Operations and Maintenance Plan-Technical Report", we understand that the bus transfer station would serve as a transfer point for rail passengers transferring to several proposed Circulator Bus routes (Tysons Circulator Routes A, B, C and D). Three (3) of the four (4) Circulator routes would serve areas of Tysons Corner that are north of the Center, including Jones Branch Drive, Westpark Drive and Tysons Boulevard, while the fourth route would service areas to the south of the Center, including Old Courthouse Road. Thus, the majority of Circulator or feeder buses (and passengers) entering and exiting the proposed transfer station could be expected to come from or be destined for areas on the same side of Route 123 as the proposed rail platform, rather than on the south side of Route 123, where the Center is located. Moreover, we also understand that the proposed bus transfer station at Tysons Central would serve passengers of Fairfax Connector and WMATA buses whose origin or destination may be Crystal City, Old Town Alexandria, Reston/Herndon and other areas of Northern Virginia. Access to these routes would,

for the most park, be via arterials such as Route 123. Again, location of the proposed bus transfer station on the north side of Route 123 would be more convenient for passengers accessing the rail platform. It also would offer less congested and more direct access to and from Route 123 for the Circulator, Connector and WMATA buses utilizing the bus transfer station. Otherwise, these buses would need to circulate through the private internal ring road of the Center, creating conflicting movements with passenger vehicles in fairly tight turning areas. By no means would these conditions be ideal. (0406, 0406-L –4)

Public Comment: To help illustrate the benefits of relocating the bus transfer facility, attached as 'Exhibit A1' is a route map showing the circulation patterns for the four (4) Tysons Circulator bus routes (Routes A, B, C and D) that are proposed to serve the Tysons Central station. 'Exhibit A2' shows the ingress/egress and circulation routes for the Fairfax Connector and WMATA buses that also will use the Tysons Central station. As is evident from the drawings, most of the routes originate and serve areas north of the Center between the Dulles Airport Access and Toll Road (the "DAAR") and Route 123. Placing the bus transfer station on the north side of Route 123 along Galleria Drive offers more direct access to the bus routes (many of the routes utilize that portion of Galleria Drive) and avoids the narrow pathways and circulation challenges of placing the transfer station on the Center's property. (0406, 0406-L –5)

Public Comment: 'Exhibit B', also attached, is an example of how the bus transfer station could be constructed along Galleria Drive on one of the currently undeveloped parcels adjacent to the rail platform (the "Alternate Location"). The proposed Alternate Location is served by a four lane divided and undivided public roadway (as opposed to a private, two-lane road at the Center) and includes median breaks for improved access and circulation into and out of the bus transfer station. It also is centrally-located to the Circulator bus routes and Route 123; in fact, many of the bus routes pass directly in front of the Alternate Location. Best of all, though, the Alternate location is undeveloped. The bus transit station could be integrated as part of a joint development with the rail station to provide convenient access for passengers while avoiding the need to "force" a transfer station into an already developed and established property. Indeed, we understand that Fairfax County already is reviewing a zoning application to integrate the rail platform and associated facilities into the design and development of the Alternate Location. Adding the bus transfer station to that design should be included in the County's review. (0406, 0406-L –6)

Public Comment: Tysons Central D Station --

A. Why are there no surface facilities planned for the north side of 123 where they would be immediately adjacent to the station entrance facilities rather than several hundred feet away on the south side of 123.
B. Does the plan for the bus terminal assume that this terminal will replace the current terminal near Nordstroms? If so, has the bus bay program adequate to accommodate both the needs of the station and the existing shopping center terminal. It would seem counterproductive to have two separate widely spaced bus terminals at one shopping center. (0387, 0387-L –45)

Public Comment: We recently met with the representatives of the Project Team to review these issues and to suggest alternative designs of the pedestrian connection. We are still working on those designs and appreciate your flexibility and willingness to consider alternative terminus designs as the project moves into more detailed engineering and design stages. We are supportive of having a pedestrian connection from the rail platform in the general location shown in the DEIS, but we ask for greater flexibility to integrate the connection terminus into the Center and its environs. At this stage, however, we understand that such a detailed design proposal is not necessary or required for purposes of determining the locally-preferred alternative. (0406, 0406-L –10)

Public Comment: Beyond the location and design of the bus transfer station, we also have concerns regarding the terminus point for the pedestrian bridge linking the rail platform on the north side of Route 123 to the Center. The pedestrian bridge appears to terminate at a point abutting Parking Terrace D. We certainly appreciate the opportunity to have direct pedestrian access to the Center and believe this

connection will help enhance transit ridership. We believe, however, that the terminus of the pedestrian bridge should be designed to better link the rail platform to the Center. (0406, 0406-L –7)

Public Comment: Indeed, providing a coordinated and convenient pedestrian connection to the Center, while retaining flexibility to modify the connection in the future, is critical to ensuring the viability of the Tysons Central station. The current design, which leads to the exterior of a structured parking facility, does not maximize the opportunity to creatively accommodate the flow of rail passengers between the rail station and the Center in a manner that would benefit both the Center and the Commonwealth. (0406, 0406-L –8)

Public Comment: As we mentioned in our presentation at the public hearings, we are concerned that the proposed terminus of the pedestrian connection at the parking structure is an invitation for transit riders to park their vehicles in our private, customer and employee parking garage and ride the rail transit line. Creating a de facto park-and-ride facility at our parking facility is not in our interest or in the Commonwealth's interest, and we ask that you work with us to prevent such a result. (0406, 0406-L –9)

Public Comment: We look forward to working with the Project Team and your office to work out these details in the coming months. In the meantime, please note that we suggest a different configuration of this pedestrian connection is appropriate, and ask that our notation be included and acknowledged in the responses prepared by WMATA. (0406, 0406-L –11)

Public Comment: Tysons Central D and Tysons West need special attention, as the station facilities are located within areas that are functionally difficult most of the year. The surface facilities should be located on the north side of Route 123 so that buses would not have to cross Route 123 and would be between the two shopping centers. Facilities should be built on vacant land, thereby guaranteeing proper integration into future development. (0387, 2-03)

> ***Response:*** *The proposed entrance pavilions and other station facilities at the Tysons Central 123 Station are important to the success of the project. In response to public and interagency review and comment on the Draft EIS, the intermodal facilities of the Tysons Central 123 Station have been reconfigured. As indicated in the General Plans (Final EIS Volume V), the south side bus bays have been relocated and reduced in quantity, and bus bays are now also provided at the north side. During preliminary engineering, DRPT and WMATA will continue to work with Fairfax County, VDOT, affected property owners and developers to coordinate integration of the station facilities with existing and proposed development. Any integration of the intermodal facilities with a proposed development will be subject to review by Fairfax County through its zoning and comprehensive planning procedures.*

Tysons Central 7 and 123 Stations

Public Comment: Tysons Central Stations. For these stations to realize their full ridership potential, kiss & ride and taxi spaces as well as bays for internal shuttles as well as scheduled bus service should be provided at each station. Again, without these facilities, which would be relatively inexpensive, the effectiveness of a transit system costing as much as $3.3 billion would be compromised. (0387, 0387-L –46)

> ***Response:*** *The Project Team will continue to coordinate with Fairfax County and VDOT on issues of station access. Due to limitations of available right-of-way, and likely limitations on additional curb cuts at Route 7, the parallel service roads, the Project Team is not proposing any off-street facilities for taxicabs at the Tysons Central 7 and Tysons Central 123 Stations.*

Vertical Circulation, Platform Clear Space, and Fare Gates

Public Comment: Stations -- While I haven't checked the designs of the stations in detail, it should be confirmed that the design of the stations including vertical circulation, platform clear space especially at the constrained portions of the platform near the stairs and escalators, numbers of fare gates and

vendors, conform to WMATA's design criteria. Since there is no indication of future fare collection equipment in any of the station designs, it should also be confirmed that the program of fare collection equipment and other facilities in the station also allows for future ridership growth (usually 30% above the design year forecast). (0387, 0387-L –28)

> ***Response:*** *Vertical circulation, platform clear space and fare gate and vendor quantities, conform to WMATA-established design criteria. Fare gate quantities shown on the drawings are for design year 2011 or 2015 patronage, and all stations have sufficient space to accommodate 2025 patronage projections. Future fare collection equipment is clearly indicated for Metrorail stations where patronage growth between 2010 and 2025 would trigger the need for additional fare gates.*

Station Site Plans

Public Comment: The site plan configurations at many of the proposed stations are poorly conceived. As the station surface facilities are the points where the traveling public interfaces with the transit system, the design of these facilities is critical if a smooth interface is to occur. A poorly functioning facility will discourage ridership. Most of the deficiencies noted below can be corrected for relatively little additional cost or impact. It's critical that the deficiencies be addressed now in the planning process with the redesigns reflected in the approved general plans for the stations. Experience has shown that the site plan configurations approved during the planning process are what you will see on the ground almost without exception. (0387, 0387-L –29)

> ***Response:*** *Station site plans represent a balance between availability of real estate, environmental constraints, and transportation programming requirements. Station site plans presented in the final General Plans demonstrate overall feasibility of the stations in each location, and the designs will continue to be refined during preliminary engineering, in coordination with VDOT, Loudoun and Fairfax counties, and adjacent property owners and developers. Experience shows that, using the WMATA Largo Extension as an example, significant refinement occurs between the early NEPA phase general plans and the final design documents.*

Configuration of Kiss-&-Ride Facilities

Public Comment: The circulation in many of the kiss & ride facilities calls for traffic to proceed the wrong way along aisles that are clearly intended to be one way aisles in the opposite direction due to the orientation of the parking spaces. (Traffic proceeding in the "wrong" direction could not access the angled parking spaces which are oriented in the opposite direction.) Also many of these same facilities also do not allow kiss & ride traffic to recirculate within the lot to be able to return to vacant spaces that may have been by passed on entry into the lot. This is a particularly important feature to provide when the lots are crowded during the PM peak period. Another problem with some of the kiss & ride facilities is that they place the passenger loading area at the end of the facility which would cause waiting vehicles to queue at the turnaround area where the pavement is the narrowest thereby jamming up the entire facility. These end loading facilities lead to operationally disastrous situation. The conditions noted above are found in the proposed site plans at the following proposed station sites. Route 772: BRT Option 1 has wrong way traffic, lack of or poor recirculation, and end loading; BRT Option 2 has lack of or poor recirculation and end loading; "Metro North" Option 1 has lack of or poor recirculation and end loading; "Metro South" Option 2 has lack of or poor recirculation and end loading. Route 606: BRT 1 has lack of or poor recirculation and end loading; and "Metro L1" has wrong way traffic. Route 28: "D1 South" has lack of or poor recirculation. "Reston Parkway North": BRT 1, BRT 2, and "D1" have wrong way traffic, lack of or poor recirculation, and end loading. "Reston Parkway South" has lack of or poor recirculation and end loading. Tysons East Station has end loading. (0387, 0387-L –30)

> ***Response:*** *Kiss & Ride spaces cited in this comment are correctly configured in accordance with current WMATA practice, allowing vehicles to move forward while entering and exiting the space. Route 772 plans cited in this comment provide for recirculation; comments regarding end*

loading will be addressed as station plans are refined, and will be balanced against programming needs and real estate availability. Recirculation on the cited plan at Route 28 South has been addressed in the final General Plans.

Public Comment: Route 606 BRT 1- K & R driving aisles too narrow. (0387, 0387-L –31)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Configuration of Parking and Bus Platforms at Route 606 Station

Public Comment: Route 606 Metro L1- Locating the garage so that all of the people parking in the garage have to cross the bus lanes to reach the pavilion will severely disrupt bus operations. Garage vehicular access is poorly configured with limited queuing area beyond the gates and dead end areas within the garage. (0387, 0387-L –32)

Response: *Bus facilities are sited to optimize access to the station entrance pavilion, which includes vertical circulation accessed directly from upper levels of the parking structure. This will provide access for almost all park-and-ride patrons, without having to cross the bus lanes. Ramps are configured to support phased construction of the garage. Exterior queuing is based on the split road system and the fact that the cars will have free flow into the garage at all times on a pay-on exit system. Access configuration promotes a straight in and out flow to the main ramp systems within the garage. The internal exit queuing on the ramp system works well for exit queuing. A small amount of dead-end parking is present only on the first level on the first phase, and was included to maximize the investment in parking.*

Public Comment: Route 606 BRT 1,2,3. Garage vehicular access is poorly configured with limited queuing area beyond the gates, dead end areas within the garage, ramp designs that won't result in the optimal circulation within the garage. (0387, 0387-L –33)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Route 28 Station Kiss-&-Ride

Public Comment: Route 28 D1 South. Kiss & ride facility is poorly designed and very likely undersized. The L-Shaped garage inefficient from a circulation standpoint. (0387, 0387-L –34)

Response: *The park-and-ride structure cited in this comment has been configured to avoid impacts to adjacent wetlands. The southside Kiss & Ride at Route 28 has been refined in the final General Plans.*

Public Comment: Route 28 D1 North- Kiss & ride facility very likely undersized. (0387, 0387-L –35)

Response: *Facilities shown in the final General Plans meet patronage demand for Kiss & Ride/short-term parking. This facility has been configured to minimize real estate requirements.*

Herndon-Monroe Station Kiss-&-Ride Spaces

Public Comment: Herndon-Monroe BRT 3. What are unlabeled pull in/backout spaces on the north side of the facility for? Whatever they're for, the need to back out of the spaces will compromise traffic

flow. General vehicular traffic should not be allowed to be in the bus bays on the north side as it will compromise bus operations. (0387, 0387-L –36)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. The cited facilities are no longer an element of the site plan.*

Tysons West*Park Kiss-&-Ride Spaces

Public Comment: Tysons WestPark BRT 1&2. The pull in/back out spaces will impede traffic flow within the kiss & ride facility rendering it effectively useless during the PM peak period. The resulting spill over will impede bus operations which will make the entire local side of the facility essentially useless. (0387, 0387-L –37)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Tysons West Kiss-&-Ride Facility

Public Comment: Tysons West Metrorail. The kiss & ride facility appears to be much too small to be effective. The pull in/back out spaces will impede traffic flow within the kiss & ride facility rendering it effectively useless during the PM peak period. Where are facilities for taxis and employee shuttles? (0387, 0387-L –38)

Response: *For Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.*

Tysons East Kiss-&-Ride Spaces

Public Comment: Tysons East Station. The use of pull in/back out spaces along what would be the primary drive aisle would seriously disrupt traffic flow and would effectively cause the facility to fail during the PM Peak hour. (0387, 0387-L –39)

Response: *During preliminary engineering, this aspect will be considered.*

Confirm Bus Bays are Adequate at Stations

Public Comment: Bus Terminals. Confirm that the facility programs for the bus terminals at the various stations include adequate bays for layovers and storage as well as designated spaces for the supervisors and service vehicles. (0387, 0387-L –40)

Response: *Bus terminal plans incorporate passenger boarding capacity for revenue and non-revenue operations. Spaces for supervisors and service vehicles would be established within public parking areas.*

Bus Terminal Configurations

Public Comment: Also, the configuration of the bus terminals as proposed at some stations are such that a bus will not be able to properly berth itself at some of the bus bays. The ability of buses to be able to recirculate facilitates operational planning and particularly layovers where it may be desirable for the

layover to occur in a remote part of the terminal. Thus the site plans should be configured to allow recirculation of buses within the terminal to allow them to reach any bay from any other bay. Route 772, Metro South Option 2 has inaccessible bay(s) in the southwest. Route 606 BRT 1 has lack of or poor recirculation. Reston Parkway South has inaccessible bay(s) in the north and west and has lack of or poor recirculation. West Falls Church BRT 2 Left Door [is inaccessible] in northeast BRT bay on EB side and in north bay on WB side. (0387, 0387-L –41)

Response: *Autoturn Version 4 was used to model vehicle turning radii and tracking in station areas to ensure sufficient station access and mobility. Articulated and standard bus access was modeled for BRT and standard bus access sites. The individual berths cited in this comment were reviewed and found to provide adequate access and egress. Bus recirculation will be addressed as plans are refined during preliminary engineering.*

Design Comments on Tysons West Station

Public Comment: Assuming that the [Tysons West station] access issue noted above can be addressed, the following comments on specific design issues are offered:

A. While the text seems to indicate that the ramps from the DAAR/Toll Road are for buses only, the configuration of the driveway configuration adjacent to the garage suggest s otherwise. If general auto access is not provided directly from the DAAR/Toll Road, what is the purpose of the two-way ramp into the garage along the southwest side of the structure parallel to Route 7? If all or nearly all of the vehicles entering the garage are expected to do so from Tyco Road, the access system shown is totally inadequate for the 2000 spaces provided in the current garage design, let alone for the capacity which should really be provided to address the full projected parking demand.
B. The traffic flow at the gate array at the Tyco Road entrance as currently designed has too many movement conflicts at the garage side of the array to function at all well.
C. To effectively distribute vehicles within the garage, the ramp system should be located closer to the center of the garage. At least one aisle should be provided between the sloping floor ramp and the perimeter of the garage.
D. Details of the ramp between the garage and the Dulles Toll Road and Airport Access Road should be provided. The plans don't show the ramp system to the garage from the toll road and Airport Access Road. It seems as though it could be very complicated with the need to provide toll collection capability from the Toll Road and separate access to the airport access road for buses and airport bound traffic. (0387, 0387-L –44)

Response: *The BRT, BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

For Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.

Rail Will Not Reduce Congestion

Public Comment: The third urban legend is that rail is going to reduce congestion in the corridor, and that is flat out incorrect. In fact, I give credit to the EIS, they don't claim that rail is going to reduce congestion. We know it will not. It has not reduced congestion on I-66, and the people who did the beltway study didn't even consider rail for the beltway because their conclusion was it wasn't even worth studying. (0184, 0184-T –4)

Public Comment: The VDOT study of the Beltway situation accurately concluded that Beltway, carrying more than twice that in the Dulles Corridor, would not benefit from rail. So why are we thinking of heavy rail in the much less congested area outside the Beltway? (0162, 0162-T –6)

Response: *The information contained in Chapter 6 of the Final EIS confirms that two Build Alternatives are expected to result in reductions in congestion on most regional roadways. In addition, traffic conditions in the vicinity of proposed stations are generally expected to worsen during the peak periods as transit patrons drive to and from these stations. However, the two Build Alternatives, in combination with the planned transit-oriented urban form, will help to increase overall mobility in the corridor, the counties, and the region.*

The Capital Beltway MIS advanced several recommendations, including additional study of rail transit along the Beltway corridor. Based on analysis conducted during the MIS, the study sponsors concluded that the regional transit share would increase if the radial lines of the Metrorail system were connected with a Beltway alignment; however, there was not a corresponding decrease in the traffic congestion along the Beltway corridor. Nonetheless, because rail improvements were seen to have benefits for the region, rail transit improvements in the Beltway corridor were further studied by DRPT in the Capital Beltway Rail Feasibility Study. The Capital Beltway EIS performed by VDOT only considered the recommended highway improvements.

The Capital Beltway Rail Feasibility Study (March 2001) included recommendations further evaluation for several transit modes and alignments in the Beltway corridor, including Metrorail, light rail, and monorail.

New Rail Line Will Not Bring Economic Benefits

Public Comment: At the session out in Ashburn a metrorail person testified about how prosperity follows rail (as if it wouldn't with BRT). Wherever rail went, so went business. I am suggesting that wherever rail goes into this corridor, prosperity vanishes (except in East Loudoun which I will address in a moment). According to a very informal questioning of the businesses at our Parkridge Center office park (with some 3500 to 4000 potential employees), few if any riders will use rail to again access to our location along the toll road in Reston. Do you know why??? How do you walk from the Wiehle rail stop to the intersection of Sunrise Valley Drive and Hunter Mill? (over a mile). (0233, 0426-M –16)

Response: *Increased transportation access is expected to have a corresponding positive effect on property values within the immediate vicinity (one-half mile) of the Metrorail stations.*

The proposed rapid transit alternatives of the Draft EIS would not be able to serve the travel needs of all trip makers in the Dulles Corridor. They would, however—in combination with the planned transit-oriented urban form—help to increase overall mobility in the corridor. Highway and transit improvements that address other travel needs are recommended in the Northern Virginia 2020 Plan, the Statewide Transportation Plan, and local comprehensive plans. Overall, this program of improvements is intended to increase mobility and address the existing and potential future deficiencies in Northern Virginia.

For trip generators near Sunrise Valley Drive and Hunter Mill and those beyond walking distance from the Metrorail stations, a mode of access may be Fairfax Connector feeder bus service or private shuttle bus service.

As explained in Chapter 2 of the Draft EIS and in Appendix H of the Final EIS, during the early stages of the EIS process, a number of station alternatives were considered for the Dulles Corridor Rapid Transit Project, including a station at Hunter Mill Road. This station was eliminated from more detailed consideration in the Draft EIS because it would not be consistent with current or planned land use in the vicinity of the station. These reasons are explained fully in the Final Alternatives Analysis Report (May 2001). Some findings are summarized below.

Low-density land uses surrounding the proposed site would not generate enough ridership to support a station at this location. In addition, the citizens in the area expressed strong opposition to a station at Hunter Mill Road.

The Dulles Corridor Land Use Task Force, appointed by the Fairfax County Board of Supervisors, stated strong opposition to a station at Hunter Mill Road in lieu of the proposed station at Wiehle Avenue. The Task Force voted at its session on February 26, 2001 to endorse the elimination of the Hunter Mill Station and continued planning for the Wiehle Avenue Station. The Comprehensive Plan changes adopted by the Fairfax County Board of Supervisors on May 21, 2001 support this position; no transit-oriented land use plans have been adopted or considered for a proposed station in the vicinity of Hunter Mill Road.

Proposed Stations In Tysons Corner Would Lack Accessibility

Public Comment: I live on Old Dominion Drive just west of Spring Hill Road and I believe that all of the proposed rail solutions do not serve the needs of my neighborhood. Only one of the proposed Tysons rail stations would have parking. The Tysons West station is proposed to have a 2000 car parking garage. To access this station to commute to work in Reston, go Dulles Airport or to downtown DC, would require driving into Tysons through intense congestion during working hours. Besides adding to already severe auto congestion, making a trip using rapid transit would take more time than simply driving to my final destination. If the commute were towards DC, it would cause at least one train change at Falls Church. At least the proposed Bus Rapid Transit (BRT) station at Spring Hill would require driving through less congestion as it is on the periphery of Tysons Corner as opposed to within it. (0233, 0426-M –24)

Response: *As part of the selection of the Locally Preferred Alternative, accessibility to stations, ridership, and effects such as congestion were considered by the decision-makers.*

Document Is Biased In Favor Of Metrorail

Public Comment: Draft EIS shows a bias in favor of "seamless Metrorail" that it projects onto riders regardless of associated costs and secondary effects. It states that transferring from bus to Metrorail at Tysons West would make the transit trip less attractive than a seamless Metrorail trip. This bias should be removed. (0510, 2-01)

Response: *As described in Chapter 6 of the Draft EIS, the number of transfers required to make a trip from an origin to a destination is one of the most important determinants of passenger convenience and comfort. Research shows that there are several reasons that transfers decrease the attractiveness of a transit service. The added time associated with transfers increases a passenger's overall trip time. Also, there is a discomfort associated with uncertainty about the arrival of the vehicle being transferred to, specifically whether the vehicle will be early (and therefore missed by on-time arriving passengers), late, or will arrive at all.*

Intra-system transfers (like transferring from one Metrorail line to another) make much of the burden typically associated with a transfer between two modes less onerous, but still require moving between platforms and does not provide the convenience of a one-seat ride. Therefore, this type of transfer would still affect ridership levels.

As described in Chapter 8 of the Draft EIS, it is assumed that the Dulles Corridor transit line would use the same fare structure, regardless of the technology selection (BRT or Metrorail) as the existing Metrorail system and that this fare would be adjusted for inflation over time. Currently the maximum fare on the Metrorail system is $3.90. For trips between most parts of the corridor and Arlington and the core, the maximum fare would apply. In addition, parking fees would apply at the stations.

Data In Document Needs To Be Converted

Public Comment: Projections are based on insufficient, erroneous, and/or misleading data (MWCOG Round 6.2 data). Without use of corrected data, the Draft EIS will remain speculative. (0510, 2-02)

***Response**:* For the travel demand forecasting in support of the Final EIS, Round 6.3 of the MWCOG Cooperative Land Use Forecast was used.

Data on Rail Speed Is Not Realistic

Public Comment: If average Metrorail speed is 36 mph, then some of the travel times between stations are not realistic. Travel times to Metro Center on page 107 of Technical Report and page 6-40 of DEIS are overly optimistic and contain disparities. (0112, 2-01)

***Response:** The average speed along the entire corridor is 36 mph. Speeds between stations will vary depending on the distance between stations and the number of curves and other track geometry issues. The travel times for Metrorail in the corridor were developed using a detailed simulation package that takes into account station dwell times, number and radius of curves, allowable train speeds, vehicle acceleration rates, number of stations, and distance between stations. Travel times for Metrorail outside the corridor are based on the Metrorail operating schedule.*

Ridership Estimates Are Overly Optimistic

Public Comment: States that the run times are not "real world", and that the station dwelling times are not realistic if the Project Team is anticipating high Metrorail ridership. Hence, the ridership estimates are overly optimistic. (0112, 2-02)

***Response:** As noted previously, the run times in the corridor are based on a detailed simulation package that considers a number of factors. This simulation takes into account the specific characteristics of Metrorail vehicles as well as measured performance on Metrorail and other rail systems (e.g., the performance of vehicles as they move through a curve). The dwell times are based on WMATA experience on the existing Metrorail system. Therefore, the run times do reflect 'real world' experience.*

Clarification Needed on Response to Previous Question

Public Comment: States that the Project Team failed to answer his question of whether the 11,000 fewer boardings on the three western most Orange Line stations counted in the Total Boardings for Dulles rail in 2025. (0112, 2-03)

***Response:** The total boardings in the Dulles Corridor do reflect the passengers moving from Orange Line stations to the Dulles Corridor.*

Aerial Alignment Is Not Desirable

Public Comment: Again, as others have mentioned, the aerial lines to and through Tysons Corner would be far too noisy, in my opinion. I think there could be better land use where the aerial lines are planned to run. You can have plazas, sidewalk cafes, artwork, fountains, more trees, a little bit of greenery would help. I think it is important to put Tysons Corner on the same level playing field as other high density urban areas in the Washington area where the metro system has underground service, like in downtown and Bethesda and Rosslyn, among other places. (0071, 0215-T –6)

Public Comment: We expect our elected officials and our civic leaders to protect our quality of life, our property values and our welfare as residents/taxpayers/voters in Fairfax County, where possible. We want to sleep in relative peace and quiet at night, and continue to be proud of living in Tysons Corner - in the 21st century. Bottom Line: Please - no elevated trains or stations in residential areas. (0411, 0411-L –3)

Public Comment: Plus I think we need to look to the future. We are building a system here for 100 or 200 or maybe a lot more years than that. Who knows what Tysons Corner is going to look like in 50

years or 100 years? Do we really think that the south side of Route 7 is going to be lined with auto dealers in the year 2102? I don't. I think an aerial line through Tysons Corner will make the future development of the area much more difficult and we should not burden our descendants with a noisy and intrusive aerial alignment there. (0071, 0215-T –7)

Public Comment: If the rail option is selected as the Locally Preferred Alternative, we are extremely concerned that it is proposed to be aboveground in Tysons Corner. An elevated structure will create major aesthetic and access issues. These issues effect our properties as well as many of the properties in the district, and time does not permit me to go into those issues. (0139, 0139-T –8)

Public Comment: Every aerial system that I have seen, and I've seen several of them, I've seen them in New York, I've seen them in Sydney, Australia, they have absolutely been destroyed the area and eventually had to be taken down and brought underground. I don't believe an aerial system is a viable system. It certainly is not going to be viable for the residents of Rotunda, for the owners of the Rotunda. It's going to reduce the property values and make our life miserable, especially those people who will look out here and witness all the noise and visual pollution that such a system would bring. (0160, 0160-T –3)

Public Comment: In general I am against any kind of elevated Metrorail. Underground is okay. Elevated on the other hand looks like Brighton Beach! And I don't need to explain how awful that is. (0064, 0064-CC-2)

Public Comment: I think it would be a mistake to have an aerial alignment through Tysons Corner. (0074, 0074-CC-2)

Public Comment: As much as I am eager to see a rail transit system serving Tysons Corner and the Dulles Corridor built right a way, when at the Draft EIS public hearings I see the WMATA model representing an elevated rail platform passing through Tysons Corner, I cannot help but think of the horrendous 1880's vintage "El" transit system that continues to be the curse of downtown and outlying neighborhoods in Chicago. The "El" is hardly the noble hallmark for the mobility system of a great American City in the 21st Century. I shudder to think of Tysons Corner in the year 2102. (0088, 0088-L –1)

Public Comment: Opposed to elevated transit in Tysons Corner. An elevated alignment will bring dirt, pollution (air and noise), and cause structural problems at the surrounding buildings. (0512, 2-01)

> ***Response:*** *The above comments pertain to Alignment T4 of the Draft EIS. Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT, BRT/Metrorail and Phased Implementation Alternatives and Metrorail Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Seeks Clarification on How Dulles Line Leaves Orange Line

Public Comment: As the train branches off from I-66 will it do so by going underground to cross the west bound lane of I-66 or will it do so by using an aerial bridge? (0117, 0117-E -6)

> ***Response:*** *The Dulles Corridor line will branch from the existing Orange line via two separate aerial bridge structures, one for each direction of track. These structures will cross the lanes of I-66 (and associated ramps) into tracks for the Dulles Corridor line that will run in the median of the Dulles Connector Road.*

Stops in Tysons Corner Will Decrease Train Speeds

Public Comment: My specific comments tonight are directed toward the need to make the system fit its name, rapid. Rapid rail or rapid bus. In fact, rapid rail or bus to Dulles, with the current design of multiple stops in Tysons, might put us in the position of taking the name "rapid" out of the name. (0148, 0250-T – 2)

> ***Response***: *Relative to BRT, the additional Metrorail stations in Tysons Corner does not reduce the "rapidness" of the Metrorail Extension. The Transit Operations and Maintenance Plan (June 2004*) *shows that the LPA Alignment T6 has a travel time of approximately 41 minutes between the Route 772 and East Falls Church stations. The all-stops operating pattern for BRT 1 has a travel time of approximately 48 minutes between Route 772 and West Falls Church, even though this alignment has fewer stops than Alignment T6.*
>
> *In response to comments following the publication of the Draft EIS, the Project Team evaluated a new alignment option for the Metrorail Alternative that would provide for express service that only includes one stop at Tysons Corner. The alignment would include a leg that extends along the median of the DIAAH on the north side of Tysons Corner, and would include a stop at Spring Hill Road.*
>
> *The analysis for this alignment option shows that a one-stop bypass of Tysons Corner offers very little travel time savings. Moreover, given the length of most trips on the transit line, the time savings would be considered negligible. A one-stop trip between Wiehle Avenue and East Falls Church on an alignment that runs along the median of the DIAAH would save approximately 4.5 minutes over Alignment T6, an alignment that penetrates the core of Tysons Corner and includes four stations. Given that transit travel times on the Dulles Corridor line for trips between Arlington and the central and western portions of the Dulles Corridor would be approximately 30 to 50 minutes, a time savings of 4.5 minutes would be negligible. For whereas the perceived difference between a 5-minute trip and a 10-minute trip could be substantial, the perceived difference between a 25-minute trip and a 30-minute trip is relatively minor.*

Need More Rail Coverage in Tysons Corner

Public Comment: My conclusion is in these tough economic times to invest our limited metrorail dollars where it counts, in Tysons. That means building T-2 [T-4] metrorail and dropping the Western rail segment. And the plans need to be coordinated with potential beltway rail and potential Route 7 rail originating from Bailey's Crossroads. Metrorail should crisscross Fairfax County's downtown in a grid, the way it does in downtown D.C. (0134, 0134-T –10)

Public Comment: If a concerted effort is in fact made to make Tysons a mixed-use, walkable, livable place, then we need to be considering how to crisscross Tysons with multiple grade-separated rail lines, not just one branch from the Orange Line that serves Northern Tysons. Just as a network of rail lines serves downtown D.C., so should the network of rail line serve Tysons, including Purple Line beltway rail stations that would serve Southern Tysons and Route 7 Bailey's Tysons rail stations that would serve Southeastern Tysons. (0134, 0134-T –3)

> ***Response:*** *An alignment that would provide a connection to a future transit line in the Beltway corridor was examined during the early stages of the Dulles Corridor Rapid Transit Project, and was eliminated from further study. The reasons for the elimination of this alternative is fully detailed in the Final Alternatives Analysis Report (May 2001) and are summarized below.*
>
> *The plans for future transit in the Beltway corridor are not advanced enough to make it appropriate or feasible to conduct detailed coordination efforts related to these improvements. The Capital Beltway corridor Rail Feasibility Study includes recommendations further evaluation for several transit modes and alignments in the Beltway corridor. Further study would be necessary to advance Beltway Rail plans to the level that coordination would be possible.*

Redesign T-4 as a Loop

Public Comment: In addition to the proposed Route 123/Route 7 route, the need for the two way system to go directly along the Dulles Corridor would benefit greatly some of the largest Tysons employers and owners of residential property. This would also provide a good two-way loop for the entire Tysons region. I was dismayed to read that the "T-4" design was only a one-way system, which would not provide a complete loop system through Tysons. Please clarify if this is a misunderstanding on my part. This one-way route is reported to cost an additional $400 million, making the total project $3.7 billion. (0274, 0274-L –2)

Public Comment: Support the additional metro loop through Tysons (2) – asap. The underground station(s) (Metrorail) is the better plan- for Tysons 2. Given the density of Tysons Corner, I do not see how you cannot put a loop through Tysons? A loop through Tysons is critical/needed! (0046, 0046-CC-2)

Public Comment: If running this loop or spur is essential, then please put it underground to reduce/eliminate noise. (0020, 0020-L –3)

Public Comment: Please put the T-4 Loop under-ground. (0056, 0056-CC-1)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and agency review and comment on the Draft EIS.*

The T2, T5, T10, and T11 'loop' alignments had been analyzed by the Project Team and eliminated from further consideration during Intermediate and Final Screening for a variety of reasons. The screening analysis and results have been detailed in the Final Alternatives Analysis Report (May 2001). The results were also described in Chapter 2 of the Draft EIS and are summarized below.

Alignment T2 was the first 'loop' alignment considered for the project. It had been developed by the Project Team subsequent to the Major Investment Study as a way to serve more of Tysons Corner. Alignment T2 included loop connectors that would have allowed trains to turn back at Tysons Corner, or even operated a loop circulator system in Tysons Corner. Operational Analysis of both the turn-back and circulator service showed that there would have been difficulties operating this service. Detailed design studies showed that Alignment T2 would have been difficult to design and construct to WMATA design standards, and would also have resulted in more significant environmental impacts, property acquisition, and greater costs, for relatively few benefits. Alignment T4 had been developed as an alternative to the T2 alignment, without the loop connectors at each end. This alignment could have also operated 'turn-back' or circulator service through the pocket tracks at The Tysons East and Tysons West Stations, with the added advantage that it would have also served those stations, whereas Alignment T2 did not. Studies show that Alignment T4 had significantly less impacts and costs, and provided similar benefits when compared with the other loop alignments.

Alignment T2 was eliminated from further consideration because it did not attract substantially greater patronage than Alignment T4, would have cost significantly more than Alignment T4, had additional noise and visual impacts, and would have resulted in additional property acquisition when compared with Alignment T4. Because the impacts were not balanced by greater benefits, Alignment T2 was eliminated from further consideration and was not fully evaluated in the Draft EIS.

At the project scoping meetings, the Project Team was asked to consider underground alignments for the Tysons 'Loops', which was designated Alignment T5. The request for an

underground alignment was in the context of reducing the visual impacts of the loop alignments in Tysons Corner, particularly to residences along Westpark Drive. The Project Team evaluated the underground loop alignment and determined it did not perform well as measured by the project evaluation criteria. The primary benefit of the T5 alignment was that it avoided the potential visual and noise impacts associated with aerial alignments. However the price of this benefit was found to be significant.

Underground construction presents greater risks to project cost and schedule that cannot be completely identified prior to actual construction. While it is customary to assess higher cost and schedule contingencies to underground construction to cover these exposures, it is not reasonable to assign a sufficient contingency to cover every risk, and maintain a level comparison among alternatives. Most of the significant risks relate to unknown subsurface conditions, including soil conditions, utilities, archaeological finds, changed subsurface water conditions, and unrecorded hazardous materials.

Alignment T10 had been suggested as an alternative to Alignment T2 to provide greater operational flexibility. It included a second track on the south leg of the loop, and included the loop connectors. Alignment T10 was eliminated in Initial Screening because it had all the disadvantages of Alignment T2 discussed above, and the operational flexibility offered by the second track on the south leg could have be achieved by lower cost means such as pocket tracks and crossovers.

Alignment T11 had been developed by the Project Team subsequent to the scoping process in order to provide interconnectivity with a future transit line along the Capital Beltway. Alignment T11 was not compatible with current local plans and would not have served the core of Tysons Corner as well as other potential alternatives. Because of the planned widening of the Beltway, I-66, Route 7, and Route 123, implementation of Alignment T11 would have required significant right-of-way acquisition. In addition, Alignment T11 provided inferior service coverage than other loop alternatives and would have been more costly. As compared with the other Tysons alignments still under consideration, Alignment T4 did provide greater coverage in Tysons Corner, and therefore supported Fairfax County Comprehensive Plans for development in Tysons Corner better than the other loop alternatives. The ridership forecast for Alignment T4 was slightly lower than other Tysons alternatives primarily due to the way the service would have operated. Trains would have operated in one direction on each leg of the loop. Thus, patrons traveling round trip to or from destinations on the loop would have had to backtrack and transferred to reach their final destinations on one part of their trip. This transfer and additional transit time decreased ridership for Alignment T4.

Suggestions for Variations in Vertical Alignments

Public Comment: The one time that we have been told for many, many meetings was that the underground loop, rather than the aerial loop, has never been eliminated. Well, it was eliminated in this report, and I feel betrayed because that has not been what was told to us in every meeting that we have had in the past, that that underground loop, which is good enough for Crystal City, good enough for Arlington, good enough for Ballston, and good enough for Rosslyn, why isn't it good enough for Tyson's Corner? Even Georgetown, which did not have a metro in the original planning, now is talking about having a metro. And where are they going to put it? They're going to put it underground where it belongs. (0160, 0160-T –2)

Response: *The underground alignment was eliminated in Intermediate Screening, performed in April 2001. The findings were published in the Final Alternatives Analysis Report in May 2001. The reasons for eliminating the underground loop in Tysons Corner are summarized above in the response to Comments (0134, 0134-T –5), (0274, 0274-L –2), et al.*

Public Comment: I know that people will argue that modern elevated construction is neater and smaller and allow quieter operation, but a train high up in the air is still objectionable. If the Westpark route is

deemed so desirable, it should be put underground for the 500-1000 yards in the vicinity of the apartment complexes. The terrain is such there that the trackage would be quite level. Such facilities should be expected to last a 100 or more years, and over the years the extra cost will be easily worth it. (0305, 0305-L –2)

> ***Response:*** *The Project Team recommended and the decision-makers selected Alignment T6 as the Locally Preferred Alternative. Alignment T4 was eliminated from further consideration after the public and agency review and comment on the Draft EIS.*
>
> *A conceptual study alignment and profile had been developed for placing the Tysons Central B Station underground along with approximately 2000 feet of the track alignment. A preliminary cost estimate indicated this would cost approximately $66 Million more than Alignment T4 aerial station.*

Public Comment: If the rail (and highway) right-of-ways were below grade at the Town Center and Wiehle Avenue stations, connection between the North and South parts of Reston, adjacent to the Dulles Corridor, will be more easily accommodated and the sound and visual impact of the Rail Corridor will be controlled. Not only air rights over the corridor, but also adjacent property values will be enhanced greatly to allow for civic and housing needs to be accommodated. Coincidentally, it is very economical to simply cut the new railway bed at the Town Center station, since a significant rise occurs between 1338+00 to 1390+00, with the highpoint at 1358+00 (see the profile cuts on drawing sheets 143, 144, & 145). The highpoint (at 428) is about thirty-three (33) feet above the start and end of the rise. This will allow for both the highway and railway to be below grade at the Town Center station. Similar possibilities exist at the Wiehle Avenue station. Note that if the "Dulles Corridor" were below grade, pedestrian (and jitney) access to the Town Center station would be much easier, eliminating the need for elevators/escalators on each side of the "Corridor". (0441, 0441-E –4)

> ***Response:*** *A basic project assumption has always been that Metrorail in the median of the Dulles International Airport Access Highway (DIAAH) would be at-grade. There are also no plans or funding available to place all of lanes of both the DIAAH and Dulles Toll Road (DTR) in a deep retained cut section. Lowering both the highway and rail profiles would be enormously impactive to the area and add significant cost to the Project. A long length and height of retaining walls would be required on both sides of the corridor and significant underpinning of the bridge piers at Wiehle Avenue and Reston Parkway would also be required to depress the profile.*

Public Comment: Additional study of the feasibility of running the rail line underground at this section [WFC Yard near Westhampton] to address noise and visual pollution concerns related to having a freeway, train yard and aerial metro service all near residential areas. (0430, 0430-E –9) (0431, 0431-E –9) (0438, 0438-E –8) (0442, 0442-L –8) (0465, 0465-L –9) (0466, 0466-L –8) (0467, 0467-L –8) (0469, 0469-L –8) (0470, 0470-L –9) (0471, 0471-L –8) (0473, 0473-L –9) (0474, 0474-L –9) (0386, 0386-E –9) (0398, 0398-L-9)(0399, 0399-L –9)(0403, 0403-L –8)(0412, 0412-L –9)(0415, 0415-L –9)(0416, 0416-L –9)

Public Comment: Underground by Tysons. (0061, 0061-CC-1)

Public Comment: Above ground negatively impacts unique aspects of area. Area around Tysons still evokes pleasant urban area as opposed to industrial. (0061, 0061-CC-3)

Public Comment: I do believe that the best and only remedy to our problems and to prepare for the anticipated future growth, is by way of a Metrorail system from West Falls Church station to the airport. But an underground railway all the way is the only way to go. Look back into history and you will find that elevated railways there through are the kiss of death to any city area. It is the greatest producer of slum areas (the third and sixth ells in New York City, the Loop in Chicago); who in the right mind with other options available would choose to reside or work next to and elevated railroad? Build an elevated railroad through Tysons Corner area and you will cause the greatest slum area the State of Virginia has ever known. (0085, 0085-L –2)

Public Comment: Finally, I believe that rail in Tysons Corner area should be underground. I think the aerial stations appear to be too massive and looked at in certain ways even ugly. You can look at the drawings on pages 16 and 17 of the executive summary, and I believe you will see this. (0071, 0215-T – 5)

Public Comment: Prefers underground Metrorail. (0506, 2-02)

Public Comment: Prefers underground Metrorail. (0338, 2-01)

> ***Response:*** *The planning for the connection to the Orange Line of the proposed Metrorail extension has always incorporated the use of at-grade and aerial methods of construction for connecting the flyover from the median of I-66 to the median of the Dulles Connector Road. Provisions for this connection were made with the original construction of the Orange Line in the early 1980s, including the construction of a pier and foundation in between the Orange Line tracks to facilitate such an aerial structure to minimize eventual disruption to the Orange Line during construction.*
>
> *The impacts and costs for underground construction of this connection were not evaluated as part of any current alternative in the Draft EIS. Making this connection would present extremely complex construction challenges to keep the Orange Line fully operational and not impact both directions of I-66, a major interstate highway. Due to its complexity, the cost of this underground construction for this segment would be significantly greater than typical cut and cover construction, and many times greater than the planned at-grade and aerial construction.*

Public Comment: Underground installation [of the WFC yard lead]. Mr. Dittmeier indicates that underground may not be practical because of construction and maintenance costs. Is it possible for the planners to give this option further study? If the track is to be elevated, install a tunnel-type cover over the track. A problem, as Mr. Dittmeier explained, is the explosive expulsion of air from the tunnel as the train exits. A slot along the top of the tunnel would take care of the air-blast problem. (0432, 0432-E –5)

> ***Response:*** *The current alignment for the West Falls Church Yard lead track is partially underground as it goes beneath the eastbound Dulles Connector Road lanes and enters the rail yard. The remaining portion of the yard lead in the median of the Dulles Connector Road will be on aerial structure in order to meet the grade from the both the inbound and outbound project tracks descending from the flyover across I-66. Within the yard proper, the Project will enclose of a portion of the loop track at the yard's eastern end and the new yard lead in box structures. There should not be the air-blast due to the short section of the underground yard lead and to the low speed of trains.*

Public Comment: They tell me that the train will take to the air after Haycock Road in the 66 median and rise to over 40 feet in the air and continue in the air until Idylwood in the median of the access road. All of this while the trains are making 90 degree turns. (0117, 0117-E -2)

> ***Response:*** *The trains will be making an approximately 75 degree turn (somewhat flatter than 90 degrees); however, with the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road.*

Concerns About Impacts On the Washington Dulles Marriott Hotel

Public Comment: After reviewing initial plans for the planned rail alignment at the Dulles International Airport, it is our opinion that the Washington Dulles Airport Marriott Hotel will be negatively affected on a permanent basis. Our opinion has been developed on the basis of our understanding and interpretation of plans and documents for our review, including Sheet 9 of the Environmental Constraints and Limit of Disturbance. Our greatest concern is that, as proposed, the rail line will emerge from the underground

Dulles Airport Station along Autopilot Drive in close proximity to the and public meeting space. Among other concerns, we understand that it is standard procedure for trains to provide audible warning signals when emerging from tunnels, and our fear is that this and other regular noise factors will disturb and otherwise adversely impact the experience of guests and patrons of the hotel. The currently proposed placement of this tunnel will also have an adverse impact upon our property and the operation of the hotel in that it is in the vicinity of a significant access point to the hotel from Autopilot Drive. The mouth of the rail tunnel would interfere with the area of ingress and egress along Autopilot Drive, forcing guests and employees onto Aviation Drive, and resulting in inconvenience as well as increased congestion and traffic counts on this two-lane road. (0453, 0453-L –1)

Public Comment: Relocating the entry/exit to the tunnel farther north on Autopilot Drive, preferably at a point beyond the hotel's property line, will likely address our primary concerns relating to the anticipated environmental and economic effects that the proposed rail project would have on our property. (0453, 0453-L –2)

> ***Response:*** *With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team relocated northward the portal at the western end of the Dulles Airport tunnel so that the Project's effects on the Dulles Airport Marriott have been reduced. This relocation is part of the Full LPA and final General Plans.*

Prefers A Different Point of Connection To The Orange Line

Public Comment: If rail must be added, it would seem that a more direct route would be from the East Falls Church station rather than West. (0267, 0267-L –3)

> ***Response:*** *The selected LPA, a Metrorail Extension, has a "seamless" connection to the Metro Orange Line that would connect to the existing Orange Line at a point between the East Falls Church and West Falls Church stations, allowing passengers to transfer to an Orange Line train in either direction at the East Falls Church Station.*

Suggestions For Variations On the T-8 Alignment Option

Public Comment: We would have preferred the so-called T-8 alternative that proposed main line, at-grade trackage with a circulation feeder system to serve Tysons, but that was dropped during the Alternatives Analysis - prematurely, in my view. (0137, 0176-L –2)

Public Comment: Please put the T-8 option back on the table, that's the single station option. Let's not rush through in 30 days decisions that cannot be undone or corrected in a lifetime. (0148, 0148-T –8)

Public Comment: It is almost too easy to imagine attractive monorail or other circulating transportation system taking people to and from a single rail stop at the periphery of the city of Tysons Corner, while simultaneously serving the thousands of people who populate and need to circulate in and around these cities by day and by night. (0148, 0148-T –6)

Public Comment: I believe that a single heavy-rail station with a connection to a light rail or monorail loop is a more appropriate solution for transportation within Tysons Corner. Monorail or light rail would allow for three or four times the number of stations and offer more frequent trains. Which would you rather do? Be delivered directly to a station up to a mile from your destination, or change trains and end up a few blocks from where you're going? I submit to you that most commuters would prefer the latter. (0178, 0178-T –3)

Public Comment: It is disappointing that WMATA has prematurely chosen to dismiss the very viable T-8 alternative. It is in the region's best interest to first extend rail out to Dulles to provide the majority of commuter with mass transit opportunities and then focus on Tysons Corner. The T-8 feeder system to and at grade, main line metro system, would be a simpler, more timely, less expensive option that would provide through-commuters with more expedient access without delay. (0150, 0150-T –2)

Public Comment: The T-8 alternative should be reincluded for consideration. (0150, 0150-T –9)

Public Comment: A variation on the T-8 option, which was eliminated during the initial draft environmental impact statement screening phase, should be reevaluated. The draft environmental impact statement indicated that T-8 was eliminated because ridership would be lower due to the need to transfer trains. Yet the same document advanced the screwball T-4 alignment, wherein a third of the riders not only have to change trains, but they have to go all the way through Tysons and then backtrack to their destination. (0178, 0178-T –6)

Public Comment: It is disappointing to learn that the T-8 option, Tysons feeder option, has been summarily dismissed because it was determined that the Springhill Road station was inappropriate and should be rejected. By all appearances, the T-8 feeder monorail, light rail or personal rapid transit system compared to an at-grade main line metro system, could be a less expensive, greater ridership option that could provide through commuters less delay to their destination and a broader range of coverage for Tysons Corner residents and employers. A transfer the Dulles Silver Line to the Tysons feeder system is similar to a transfer at Roslyn to continue to National Airport or a transfer to Metro Center to the Red Line. This option needs to be revisited. (0179, 0179-T –5)

Public Comment: Though the option was eliminated from consideration in the recent Draft EIS study, is it too late to take another look at keeping the primary Metrorail system in the Dulles Corridor with a greatly upgraded Tysons station at Spring Hill Road / Dulles Highway? Could we then use the billion plus dollars of the proposed through-Tysons rail loop to fund the construction of a state-of-the-art people mover system serving even more of Tysons Corner? Of course, such a system would, of necessity, be elevated. It would have to be to avoid ground level congestion. However, the people mover guideway could be far less obtrusive than the conventional double track Metrorail platform. A people mover system could run more frequent service throughout Tysons serving a full range of internal trips as well as rail transit trips from outside. How many purely internal Tysons trips could be added to the transit-originated trips? No more getting into your car to do lunch at a Tysons restaurant! With Metrorail bypassing three of the four internal Tysons stations, service to Dulles airport and communities west of Tysons could be speeded up, both in terms of normal travel time and also in terms of the initial construction time. Meanwhile the internal people mover system could serve far more stations throughout Tysons. Yes, this would add an additional mode transfer for transit-originated trips. However, it is entirely likely that the net portal-to-portal trip would actually be faster for many transit users even transferring modes. Surely the technology needed to make such a system effective is already at hand. Would the net cost really exceed what is currently planned for the Metrorail stations? Probably not. Wouldn't spreading the direct economic benefit of transit throughout a broader geographic area within Tysons ultimately generate greater tax revenues to finance such a system? Yes, the option isn't on the table today, but shouldn't it be? (0088, 0088-L –3)

Public Comment: The EIS does not show how the ridership for the proposed Tysons Corner rail alternatives T1, T4, T6 and T9 compares to Alternative T8 that was eliminated from further consideration at the Initial Alternatives Screening phase. It is not clear that the alternatives proposed in the draft EIS provide significantly greater ridership in Tysons Corner for the investment than the T8 alternative. The EIS should be revised to compare the ridership of the proposed Tysons Corner alternatives and the T8 alternative. If ridership is similar, the EIS should be revised to include the T8 alternative. (0392, 0392-L –13)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*
>
> *While NEPA requires an evaluation of all reasonable alternatives, it allows alternatives to be eliminated prior to detailed studies as long as the reasons for eliminating them are discussed in the EIS. The process used for evaluating the initial list of alternatives for the Dulles Corridor Rapid Transit Project was a two-phase process: initial screening and intermediate screening. The process applied increasingly detailed and comprehensive measures of effectiveness to a decreasing number of alternatives. For the initial phase most measures were qualitative. The*

alternatives advanced or carried forward for further evaluation at the end of each phase were those alternatives that best met the transportation needs of the corridor, relative to the other alternatives under consideration.

As detailed in Section 2.6 of the Draft EIS, and in Section 2.1 and Appendix H of the Final EIS, numerous alternatives, including alternative modes of transportation, were studied prior to conducting the detailed evaluation of BRT and Metrorail as presented in the Draft EIS. As part of the Major Investment Study (MIS) for the Dulles Corridor Rapid Transit Project, a median station alignment that connected to a fixed-guideway feeder system was considered. This alternative was eliminated from detailed evaluation, because it was determined that this configuration would severely restrict access to Tysons Corner and would have potential adverse impacts on residential neighborhoods near the station site. It was also determined to be inconsistent with Fairfax County's economic development goals. In response to Scoping requests, the Project Team for the Dulles Corridor Rapid Transit Project reconsidered a feeder system connected to a DIAAH median alignment through Tysons Corner (Alignment T8). The findings of the MIS team were reviewed and found to be valid. Therefore, Alignment T8 was eliminated from further consideration and was not fully analyzed in the Draft EIS. The reasons for the elimination of this alternative have been fully detailed in the Final Alternatives Analysis Report (May 2001)..

Evaluate a BRT T-8 Alignment

Public Comment: T-8 is not a current rail alignment, but was studied previously and is in the BRT alternative. Evaluation of this combination should not unduly delay the EIS. (0170, 0170-T –8)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The BRT 1 alignment was not similar to the previously proposed Metrorail Alignment T8. That alignment had had a separate circulator in Tysons Corner, while BRT 1 did not. The T8 Metrorail alignment alternative was eliminated as documented in the Final Alternatives Analysis Report (May 2001) *and was not evaluated in detail in the Draft EIS.*

Support for the T-4 Alignment Option

Public Comment: We are writing to recommend the selection of a rail transit system through Tysons and selection of alignment T4. Of the four proposed Metro rail alignments, only alignment T4 serves all of Tysons Corner. Only T4 provides pedestrian access to the highest concentration of residents; only T4 serves the two largest employers in Tyson; and only T4 justifies the cost of the rail systems, for both the residents and the commercial property owners who will be asked to pay for the system. (0455, 0455-L –1)

Public Comment: I am a resident of the Rotonda Condominium. Proposal T-4 is clearly the best option for the 1160 residences within the Rotonda Condominium Association. Rail service would be conveniently located adjacent to our property. I am sending this note to let decision-makers know the opinion of the "silent majority" within the Rotonda. Our voice more often than not gets stifled by the retirees and reactionaries opposed to any change -- no matter how good it proves to be to us. Bring T-4 Metrorail service to Tysons and the Rotonda. (0015, 0015-E –1)

Public Comment: Tysons is planned as the downtown of Fairfax County and is envisioned as a mixed-use center with office, residential and retail components. Metrorail is the only alternative in the DEIS which will promote the vision for Tysons Corner. Furthermore, we believe the loop serving the Westpark Drive/Greensboro Drive/International Drive area as set forth in the Alternative T4 is essential to maintain this areas a prestigious office location. Westpark Drive and Greensboro Drive have long been the center of first class development in Tysons Corner. This area deserves a first class rail system to serve its many

office workers and future residents. (0413, 0413-L –2)

Public Comment: Further, our preference is for the Loop Option T4 because we believe it provides shorter and safer access to the residents who live in this area (which includes Lillian Court and Rotonda Condominiums and the Lincoln and Avalon Crescent Apartments). It also puts virtually all who work in Tysons II within reasonable walking distance to Metro. (0395, 0395-L –2)

Public Comment: Although not expressly stated in the draft EIS, only T4 provides transit stations in proximity to some of the largest employers in the area such as Freddie Mac and Gannett. Alignment T4 also provides the greatest service to the present and future residential core of Tysons Corner. By bringing transit to the greatest number of potential riders, this alignment serves the greatest public good and does the most towards relieving congestion and pollution. The station area coverage is also critical to justify the additional tax burden that the commercial owners in the area are expected to bear. (0084, 0458-E –2)

Public Comment: I am the owner of the Lincoln at Tysons Apartments located on the east side of International Drive between Jones Branch Drive and Westpark Drive. The Lincoln at Tysons currently includes 500 rental apartment units. I am familiar with the wants and needs of Tysons, apartment residents and we strongly support the Metrorail alignment T4. Tysons is a city in need of a residential heart. It needs more full time residents. It needs more services for its residents. And it needs convenient ways to move around within Tysons. Only alignment T4 creates an internal transit system within Tysons and it accomplishes this objective at a cost that is comparable to the other rail alignments. (0084, 0458-E –1) (0084, 0084-L –1)

Public Comment: I support Metro Rail to Tysons - Option T4. Tysons Corner will continue to grow and develop. By providing more stations this will increase the potential for users to choose to visit this area thus benefiting the overall economy of Fairfax Co. (0093, 0093-CC-1)

Public Comment: My LPA for Docket R02-1 is the T-4 Alignment. While I am disappointed that a true loop alternative was eliminated by the DEIS, the T-4 alternative comes the closest to providing Tysons Corner with its most viable rail service. If the land use plan for Tysons Corner is to create higher density sections and make them more pedestrian-friendly, there needs to be adequate incentive to get people out of their cars. The 6-station T-4 alternative covers the most area in Tysons with stations within a walkable distance. Of the four build alternatives, the best option is Metrorail only and build now. I fear the momentum would be lost if a phased approach were chosen. (0034, 0109-E –1)

Public Comment: T4 through Tysons provides the widest coverage for pedestrian access. (0043, 0043-CC-1)

Public Comment: Although not expressly stated in the draft EIS, only T4 provides transit stations in proximity to some of the largest employers in the area such as Freddie Mac and Gannett. Alignment T4 also provides the greatest service to the present and future residential core of Tysons Corner. By bringing transit to the greatest number of potential riders, this alignment serves the greatest public good and does the most toward relieving congestion and pollution. The station area coverage is also critical to justify the additional tax burden that the commercial owners in the West*Park area are expected to bear. (0084, 0084-L –2)

Public Comment: The other negative comment on this alignment was the visual and aesthetic impact of aerial tracks along Westpark Drive. It is unfortunate that the underground alternative of this alignment was eliminated from the EID study as this would have been preferable. However, I believe that Lincoln at Tysons residents and other renter along Westpark will be best served by and will strongly support the aerial line, given the huge benefit of transit service next door. (0084, 0084-L –5)

Public Comment: I am a resident owner at the Rotonda Condominiums in Tysons Corner and I support the all rail proposal that includes a rail loop or spur (T-4) that would traverse Westpark Drive behind building 2 of the Rotonda. This plan would be a tremendous benefit to those living in the area and who

commute to downtown DC or to points in the Dulles Corridor. It would also provide a significant increase in the property values of the Rotonda and other condominiums in the area. (0120, 0120-L –1)

Public Comment: At the July 29, 2002 hearing a small group of residents from the Rotonda objected to the T-4 rail loop. They claim the rail loop on Westpark Drive goes behind buildings 1 and 2 and that those buildings would be adversely impacted by the proximity to the elevated line. This simply is not the case because building 1 is not anywhere near Westpark Drive and in fact it backs up to International Drive. Only one half of the back of building 2 faces Westpark Drive (see attached site map and the highlighted area for the portion of building 2 that backs up to Westpark Drive). This part of building 2 contains about 50 units. I urge you to process with the full rail concept including the T-4 loop. (0120, 0120-L –2)

Public Comment: I am a resident owner within the Rotonda Condominium complex. I wish to go on record stating that Option T-4 (tee four) for Metrorail through Tyson's Corner is clearly the best option for residents in the Rotonda and Lincoln communities. (0015, 0231-L –1)

Public Comment: There has been a vocal MINORITY of Rotonda residents who have voiced resistance to all changes and improvements that would make transportation through the area of the Rotonda less congested and more convenient. Their voices are the MINORITY. For the MAJORITY of Rotonda residents, who favor changes which will drastically improve our community's access to rapid transit, please choose T-4 (Westpark Drive) as the route for MetroRail through Tyson's Corner. (0015, 0231-L –2)

Public Comment: The first one is T-4, through Tysons, which is the split single route, provides the widest coverage for pedestrian access, and I think it's the preferable route. (0043, 0276-T –1)

Public Comment: So choose rail, build it now, put in the most stations possible to serve the most people. (0034, 0109-E –3)

Public Comment: Maximum amount of stations in Tysons Corner. (0068, 0068-CC-2)

Public Comment: As for the Orange Line branch to Tysons we are discussing today, no less than the maximum six stations should be considered, which means the T-4 option. (0134, 0134-T –4)

Public Comment: On behalf of the homeowners association at the Fountains of McLean, I am writing to urge you to select Alignment T4 when you choose the locally preferred alternative. Alignment T4 will provide our homeowners with the most convenient access, allowing them access not only throughout Tysons, but also to the entire metrorail system. Without T4, Fountains of McLean residents will be more likely to use cars, which will, in turn increase traffic and air pollution. Only alignment T4 can support the needs of the future homeowners at the Fountains of McLean. Please help connect them with the rest of the Tysons community. Choose Alignment T4. (0481, 0481-E-1)

Public Comment: Agrees with Figure 7-1 on page 587, however, can only support Alignment T4 through Tysons Corner. Commenter states that the underground section of T6 will be costly, slow, and very disruptive. (0123, 2-03)

Public Comment: Opposed to Alignment T4.(0338, 2-02)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Support for the T-1 or T-6 Alignments

Public Comment: I support Metrorail (T1 or T6 only), because I believe it would improve traffic as well as property values in the area. (0030, 0030-CC-1)

Public Comment: I support alignments T1 and T6 - even though they include a partially elevated station at Tysons Central. That station (at Tysons Boulevard and Rt. 123) is not an area bordered by residences. The area already has significant noise, vibration, and visual impacts from heavy traffic volumes. Since the station would serve both Tysons 1 and 2 Malls, there is some hope that some people now driving to these malls might take public transit. At any rate, the station is clearly needed at that location. In summary, I support alignments T1 and T6. I strongly oppose alignment T4. (0124, 0124-E -3)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and was considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Support for the T-1 Alignment

Public Comment: Alignment T1 through Tysons Corner seems to be the best option. It would provide the most versatility, and serve the greatest number of people and locations.0116, 0116-E -2

Public Comment: The Metrorail Alternative is my second preference. Unfortunately, the Draft EIS does not adequately address various aspects of the supporting transportation infrastructure that would be needed to ensure the success of the Metrorail Alternative. For starters, there appears to be a conflict in the mission of this alternative. If it is meant to serve both commuting needs and for travel to and from Dulles Airport, it might be better to have the T1 Option at Tysons Corner and provide an internal transportation network for Tysons Corner proper. This would mean fewer stops and enhance the rail line's attractiveness as a way to get to and from the airport. This would also benefit people traveling to the Herndon/Reston and Loudoun County stations. (0401, 0401- L-2)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and was considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Support for the T-6 Alignment

Public Comment: As for the various alignments within Tysons Corner, the T-6 alternative appears to offer the best service for the least impact. I strongly recommend adoption of the Metrorail Alternative and the T-6 Alignment in Tysons. 0115, 0115-E –2

Public Comment: In the event Alternative T4 is not chosen as the Locally Preferred Alternative, we suggest adoption of the T6 versions with the Tysons Central C station placed underground. T6 would, in the absence of the loop, provide the best access for Greensboro Drive properties. (0413, 0413-L –4)

Public Comment: With regard to the specific Metrorail proposals for the Tysons Corner area, I am in favor of the general "T6" alignment, including the four proposed stations, being adopted as the Locally Preferred Alternative. But this alignment through Tysons Corner MUST be placed underground in its

entirety, i.e., from the point where it leaves the Dulles Airport Access Road to the point where it returns to it. My comments are as follows:
1. High-Density Urban Area- By far, this is the most important disagreement that I have with the Draft EIS. The Metrorail line within the Tysons Corner area will be serving a high-density urban area that is widely considered to be the "downtown" of Northern Virginia. In fact, the Draft EIS executive summary notes that Tysons Corner is "the primary urban center of Fairfax County today." Tysons Corner currently has about 90,000 jobs and is projected to have over 125,000 jobs in 2025. It is also the pre-eminent retail center for the entire Washington region. This is precisely the type of area that should be served by an underground Metrorail line.

2. Consistent With Other High-Density Urban Areas - Metrorail lines have been placed underground in similar high-density urban areas throughout the Washington region, such as downtown D.C., Bethesda, Rosslyn, Ballston and Crystal City. They have even been placed underground in less densely developed areas like Wheaton and White Flint in Montgomery County. I believe it is therefore appropriate that the proposed Metrorail line through the Tysons Corner area be placed entirely underground as well.

3. More Visually Appealing - The artist's renderings of the proposed elevated stations along Routes 7 and 123 in Tysons Corner show facilities of almost monstrous dimensions that will tower over many nearby buildings and act as a "Great Wall of China" visually separating the two sides of each street. The station canopies will rise to as much as 80 feet above the ground along the "T4" alignment, which I do not favor). With all of the necessary ancillary facilities beyond the ends of the platforms, these elevated stations simply have far too much mass and are, in short, ugly. However, if the "T6" alignment is placed totally underground through the Tysons Corner area, the Metrorail stations, tracks and supporting facilities can be as massive as necessary without visually impairing the street-level environment.

4. Less Noise Pollution - The elevated alignments through the Tysons Corner area will also produce a significant amount of noise pollution. This will affect people walking along Route 7, Route 123 and other nearby streets, as well as people in some office buildings and hotels that will be uncomfortably close to the rail line (according to drawings in the Draft EIS). Despite undoubtedly well-meaning efforts to limit the noise from the rail line, the fact remains that the Metrorail system uses steel wheels on steel rails and that produces noise, especially on sections of curved track. Anyone who has heard Metrorail trains going around the curve just to the south of the elevated Metro station at National Airport will understand this phenomenon. But placing the Metrorail tracks underground at Tysons Corner removes this source of noise pollution.

5. Better Land Use - By placing the "T6" Metrorail alignment totally underground in the Tysons Corner area, the land that would otherwise be underneath an elevated structure would instead be available for better and often more pedestrian-friendly uses. These could include plazas outside of office, retail and residential buildings, fountains, artwork and sidewalk cafes, as well as more trees plantings to bring a bit more of nature to this high-density urban area.

6. More Station Entrances - I believe that underground stations would allow for more entrances (or at least the provision for more entrances that could be built in the future as densities increase) to better serve the Tysons Corner passengers without the "visual pollution" caused by additional overhead passageways. This would be especially important for additional station entrances where some of the highest densities will be allowed, such as International Drive for the Tysons Central station and at Westpark Drive for the Tysons Central C station.

7. Looks To The Future - The proposed rapid transit system through the Tysons Corner area that we are discussing will be built to last for not just the next 20, 30 or even 50 years, but for at least 100 years and perhaps even 200 years or more. Who knows what Tysons Corner will look like in 50, 100 or 200 years? When considering these kinds of time scales, we should remember that elevated rail lines in high-density urban areas in this country generally have not withstood the test of time - most of them were demolished within 50 years of being built. We should therefore not burden our descendants with an ugly and noisy elevated alignment through the Tysons Corner area that will be very costly to place underground at some

later date. Building the Metrorail line underground from the beginning will be somewhat more costly now but it is simply the right thing to do. (0071, 0214-M –3)

Public Comment: Prefers Alignment T6. .(0338, 2-03)

> ***Response**: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and was considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Support for T-6 or T-9 Alignments In Tysons Corner

Public Comment: Locally preferred Alternative - Tysons Corner Alignment. Based on the information contained in the Draft Environment Impact Statement (EIS), we support building one of the four-station rail alternatives through Tysons Corner (T6/T9). We favor the alternative that would permit the station area around the Tysons Central C station to be developed in a community-friendly fashion. The challenge will be to link the areas north and south or Route 7 and the station together in a way that enhances access to the station and provides vibrant pedestrian and public open space links to the north and south. (0141, 0443-E –4)

Public Comment: Therefore, be it resolved that McLean Citizens Association endorses: The Metrorail alternative that provides rail transit service in the corridor now; Retention of Express Bus service until completion of the rail system; The T-6 or T9 alignment options because they best serve Tysons Corner; Eliminating phasing with Bus Rapid Transit (BRT) as an interim step. (0392, 0392-L –1)

Public Comment: A comparison of the estimated capital cost and ridership projections demonstrates that the T-4 alignments cost more than the other alignments and will attract fewer commuters than the others. This translates into less operating revenue and increases the magnitude of transportation subsidies that the Dulles Rail Project will require. The community effects of the T-4 alignment also compared unfavorably with the other alignment alternatives. Based on the evaluation criteria of the Draft EIS, Northwestern supports T-9 because it appears to have the most favorable economics. Northwestern supports, and prefers, the T-6. While T-6 entails higher capital costs than T-4, T-6 has a much higher projected ridership and will produce less noise and visual blight during construction and actual use because of its design to be underground for a great distance. The anticipated economic development that the T-4 alignment might encourage does not give adequate weight to the negative impact of a one-track configuration and one-track stations. As reflected in the table on page S-14 of the Executive Summary of DEIS, alignments T-6 and T-9 will generate 1,300 more new riders each weekday in the first year of operation than will T-4, and 2,500 more total riders each weekday in the first year of operation than will T-4. Only the T-6 and T-9 alignments have the Tysons Central C Station, which will enhance ridership compared to the T-4 and T-1 alignments. (0461, 0461-E –7)

Public Comment: A comparison of the estimated capital costs and ridership projections demonstrates that the T-4 alignment alternative costs more than the other alignment alternatives and will attract fewer commuters than the others. This translates into less operating revenue and increases the magnitude of transportation subsidies that the Dulles Rail Project will require. Based on the evaluation criteria of the Draft EIS, NADA supports T-9 because it appears to have the most favorable economics and the least impact upon properties surrounding that alignment. Similarly, NADA supports the T-6 alignment for the same reasons. While T-6 entails higher capital costs than T-4, T-6 has much higher projected ridership. The anticipated development that the T-4 alignment might encourage does not give adequate weight to the negative impact of a one-track configuration and one-track stations. (0477, 0477-L –14)

Public Comment: Of the Metrorail solutions presented, I most prefer T9. (0076, 0076-CC-1)

Public Comment: Whereas TYTRAN supports the extension of rail through Tysons Corner to Dulles Airport on an alignment that includes the appropriate number of stations to encourage ridership, provides the greatest access for pedestrians, coordinates with the existing roadway in Tysons Corner, provides additional parking solutions for commuters, and provides employees with the most cost effective and time saving mode of transportation with the fewest number of stops and transfers; therefore, be it resolved that TYTRAN supports the Metrorail Alternative providing rail from West Falls Church to Dulles Airport on alignment T9 through Tysons Corner, with 4 stations above ground including a short tunnel between Tysons Central and Tysons Central C stations; the development of appropriate parking solutions that do not further congest the western terminus of Tysons Corner, and enhanced pedestrian facilities to encourage ridership. (0433, 0433-L –1)

Public Comment: Therefore, be it resolved that TYTRAN supports metrorail alternative of providing rail from West Falls Church to Dulles airport on alignment T-9 through Tysons Corner, with four rail stations aboveground, including a short tunnel between Tysons Central and Tysons Central C stations, the development of appropriate parking solutions that do not further congest the western terminus of Tysons Corner, and enhance pedestrian facilities to encourage ridership. (0152, 0152-T –3)

Public Comment: Favors the other alignments particularly T6 and T9 because they allow for adequate access for users of the Metrorail system without impacting Rotonda, Lincoln, and Avalon residents. (0514, 2-02)

> ***Response:*** *Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Project Will Have Negative Impacts In Tysons Corner

Public Comment: It appears to me a multiple stop rapid rail system through the middle of Tysons Corner, with its unattractive infrastructure components, will do very little to mitigate the aboveground transportation problems plaguing both Tysons and Reston. In fact, I submit there could be serious negative effect that would be derived from the noise and visual pollution accompanying such a system. (0148, 0148-T –5)

Public Comment: Furthermore, the negative impacts of an aerial alignment would not be eliminated with any of the other rail alignments, since each of the alternatives includes some aerial segments through Tysons. We would, of course, support reexamination of undergrounding a segment of this alignment if it became necessary to mitigate this impact. (0084, 0084-L –6)

Public Comment: Quality of life issues with an aerial alignment or the construction of a tunnel on Westpark Drive, International Drive, and Spring Hill Road. Any of the other MIS Alignments (T1, T6, T9) would be preferred because they would not be located in dense residential areas. The BRT Alignments (BRT 1, BRT 2, and BRT 3) would provide the quickest solution to mass transit if the following were considered: dedicated bus lanes, the construction of a parking garage at the Tysons-West*Park Transit Center, and additional parking along the bus routes. (0515, 2-04)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *Four alternative alignments in Tysons Corner were evaluated in the Draft EIS for potential impacts. The evaluation of the selected alignment (T6) was carried forward into the Final EIS.*

The analysis presented in Section 3.4 of the Final EIS shows that Alignment T6 would have minimal visual impact in Tysons Corner.

Because the elevated portions of Alignment T6 primarily extend along relatively wide roadways, the visual impact for these alignments would generally not be as substantial. In addition, Alignment T6 includes a lengthy underground section along Route 123 and Route 7, reducing the visual effects. The most substantial visual effect would occur in the vicinity of the Tysons Central 123 Station, where landscaping would be removed and signage for the Tysons Galleria would be obscured. These effects can be mitigated.
An underground loop alignment had been previously considered in the early stages of the Dulles Corridor Rapid Transit Project. The Project Team evaluated an underground loop alignment and determined it did not perform well as measured by the project evaluation criteria. The reasons for the elimination of this alternative are fully detailed in the Final Alternatives Analysis Report (May 2001). In response to other comments during the public comment period of the Draft EIS, the Project Team evaluated a new alignment option for the Metrorail Alternative consisting of an entirely underground alignment through Tysons Corner. This alignment is identical to Alignment T6 except that it transitions to an underground alignment in the median of the Dulles Connector Road, continuing west through Tysons Corner in a tunnel. The alignment resurfaces in the median of the DIAAH on the west side of Tysons Corner. All four stations for the alignment would be underground.

Overall, though an underground alignment option would mitigate the visual and noise effects associated with the selected Alignment T6, these effects could be mitigated through in other ways at a lower cost. . Moreover, because of the length of the underground portion, the alignment would also have additional cost and schedule risks associated with underground construction.

Opposition To The T-4 Alignment

Public Comment: I am totally against the extension of rail loop around, or near, the Rotonda Condominiums. That would not only ruin any semblance of an attractive area, but would cause noise, vibrations, possibly affect the integrity of the buildings, etc., etc. (0006, 0006-L –1)

Public Comment: Northwestern strongly opposes the T-4 alignment. Additionally, Northwestern supports alternative Alignments T-6 or T-9, with T-6 being its preferred alignment. (0461, 0461-E –1)

Public Comment: Northwestern recognizes that the selection of an alignment alternative involves public interest considerations that transcend the interests of any one property owner. From a broad public interest perspective, however, T-4 an unacceptable alternative. (0461, 0461-E –5)

Public Comment: We have also seen the other options and understand T-4 would involve more expense at time when we as taxpayers have no money to waste. (0028, 0028-L –2)

Public Comment: Throughout the Draft EIS, simplicity and efficiency are identified as a means of encouraging increased ridership, which in turn will lead to improved transportation service levels. When a would-be user of rapid transit facilities encounters difficulty in reaching the user's destination, this operates as a deterrent to ridership. Efficiency and convenience are attributes essential to any alternative form of rapid transit, and with respect to Tysons Corner, the selection of an alternative alignment. T-4 is neither efficient nor simple from the vantage point of a user. The single-track configuration behind T-4 means that users will have to "double-back" to reach the proper station to travel in the direction necessary to reach their destinations. By contrast, the other alignments use double tracks, which provide the simplicity and convenience essential to attracting and retaining ridership. (0461, 0461-E –6)

Public Comment: Re: T4, which goes from 123 on Westpark. I suggest that the cost would seriously outweigh the benefits. I live in the area - obviously I'm opposed for my own personal reasons. But I also suggest that the number of additional people the rail line would attract on this span would not be enough

to warrant the cost. How many people in the area this line would focus on would ride the rail. (0051, 0051-CC-1)

Public Comment: Northwestern recognizes the value of bringing rail through Tysons Core. The BRT option will provide no service to the Core. Metro rail, on the other hand, will produce the highest ridership (twice BRT), the highest number of new riders (three times BRT), the highest percentage of people using transit, the shortest travel time and the greatest increase in capacity to move people through the Corridor. But Northwestern cannot accept the impacts of the T-4 alignment upon its asset. Alignment T-4 will have a devastating impact upon Northwestern. It will deter tenants from renewing their leases and perspective quality tenants from locating at the building. Northwestern will see the value of its limited partnership interest in the Westpark Corporate Center decrease because of the adverse impact of visual blight and noise upon the its ability to attract and retain tenants and to charge market rates on market lease terms. T-4 makes the least sense economically, and its one-way stations will cause confusion and discourage ridership without any substantial countervailing benefits. Indeed, T-4 has the most adverse impact upon communities as compared to all the other alignments. (0461, 0461-E –9)

Public Comment: For the reasons set forth below, the Association opposes the T-4 alignment. Additionally, the Association supports alternative Alignments T-6 or T-9. (0477, 0477-L –1)

Public Comment: The Association recognizes that the selection of an alignment alternative involves public interest considerations that transcend the interests of any one property owner. However, viewing the selection process from a broad public interest perspective inescapably leads to the conclusion that the T-4 alignment is an unacceptable alternative. (0477, 0477-L –12)

Public Comment: The Draft EIS stresses simplicity and efficiency as a means of encouraging increased ridership. Increased ridership, in turn, will lead to improved transportation service levels by taking would-be drivers off the road. When a would-be user of rapid transit facilities encounters difficulty in reaching a destination, ridership suffers, and the Rapid Transit Option has lost impact upon levels of service. The Draft EIS favors the Build Alternative because it will provide "as 'seamless' a service as possible between points of high travel activity…." From the vantage point of users, T-4 is neither efficient nor simple. The single-track configuration behind T-4 means that users will have to select the station that will take them in the direction that they want to go. By contrast, the other alignments use double tracks, which provide the simplicity and convenience essential to attracting and retaining ridership. (0477, 0477-L –13)

Public Comment: The Draft EIS concludes that Alignment T-4 will have a much greater impact on communities and upon visual quality and aesthetics than any of the other alternatives. Further, the T-4 Alignment will have more physical intrusions, access changes, displacement and safety concerns. For example, the Draft EIS states "because of the leg along Westpark Drive, Alignment T-4 would have the greatest visual impacts of all the Metrorail alignments." One need only review the adverse impacts upon NADA's Headquarters and upon the Westpark Corporate Center as living proof that T-4 has the most pervasive adverse community impact. In the words of the Draft EIS, "The addition of aerial rail structure to this narrow, tree-lined street would constitute a substantial change from the current visual quality of the area." Consider the aerial rail structure's devastating visual impact upon NADA Headquarters Building and the Westpark Corporate Center. NADA's engineer graphically displays the impact of the aerial structure along the Westpark Drive. Further, "residential viewers along this route would be highly sensitive to changes in the visual environment." Finally, the report concludes that Alignment T-4 has more impacts on communities than the other rail alignments." (0477, 0477-L –17)

Public Comment: Alignment T-4 will have a devastating impact upon NADA. It will reduce the Headquarters Building's usable FAR. It will deter tenants from renewing their leases and perspective quality tenants from locating at the Headquarters Building. NADA will see the value of its limited partnership interest in the Westpark Corporate Center decrease because of the adverse impact of visual blight and noise upon the partnership's ability to attract and retain tenants and to charge market rates on market lease terms. T-4 makes the least sense economically, and its one-way stations will cause confusion and discourage ridership without any substantial countervailing benefits. Indeed, T-4 has the most adverse impact upon communities as compared to all the other alignments. (0477, 0477-L –18)

Public Comment: The Draft EIS clearly recognizes that Alignment T-4 will have a much greater impact on communities and upon visual quality and aesthetics than any of the other alternatives. Further, the T-4 Alignment will have more physical intrusions, access changes, displacement and safety concerns. For example, the Draft EIS states "because of the leg along Westpark Drive, Alignment T-4 would have the greatest visual impacts of all the Metrorail alignments." One need only review the adverse impacts upon 8484 Westpark Drive as living proof that T-4 has the most pervasive adverse community impact. In the words of the Draft EIS, "The addition of aerial rail structure to this narrow, tree-lined street would constitute a substantial change from the current visual quality of the area." Consider the aerial rail structure's devastating visual impact upon 8484 Westpark Drive, as graphically displayed by Exhibit E. Finally, "residential viewers along this route would be highly sensitive to changes in the visual environment." "The DEIS concludes Alignment T-4 has more impacts on communities than the other rail alignments." (0461, 0461-E –8)

Public Comment: Extension provides for elevated rail (approximately 40 ft., as I understand it) that would include two stations on Westpark Drive and would pass within close proximity to the Rotonda Condominium located on Westpark Drive between International Drive and Greensboro Drive. This would result in highly intrusive and disruptive facility adjacent to an existing residential complex. Most Rotonda owners, including me, are not in favor of this elevated loop. The Rotonda has been an attractive and livable condominium for 24 years. Together with other residential communities in this area, we have successfully shared the mixed land uses in West Park with office, retail, and hotels. While there is traffic congestion in this area, it peaks, then disperses, and we are able to enjoy a quiet peaceful atmosphere in the evenings and on weekends. The intermittent passing of elevated Metrorail trains would certainly destroy the pleasant surroundings. (0429, 0429-E –1)

Public Comment: T-4 is not necessary to complete the Dulles Corridor Project. It will not alleviate the congestion at Greensboro Drive and International Drive intersections. It will bring property values down. We do not want a 19th century innovation adjacent to our homes. New York City got rid of the 3rd Avenue L years ago; we don't want it on Westpark Drive. We do not want Westpark Drive to look like a 19th /early 20th century tenement district. (0411, 0411-L –2)

Public Comment: T-4 Alignment on Westpark Drive. The proposal of a heavy rail line and Station (B) immediately adjacent to an existing high-rise condominium on Westpark Drive seems to disregard the human factor and the welfare of the people actually living there (the southern leg through the commercial areas on Rte 123 and continuing on Rte 7 would be underground). Imagine a train on stilts stopping and starting every 15 minutes right outside your bedroom/living room. (0411, 0411-L –1)

Public Comment: I am DEAD SET AGAINST the T4 option for Metrorail, or any kind of elevated rail-due to the disruption, noise, and horribly unaesthetic prospect of us apartment owners' having to stare at an elevated railroad from an open window!! This would hurt property values everywhere in Tysons & just be plain ugly. (0030, 0030-CC-2)

Public Comment: My wife and I are very concerned about plan T-4 that is one of the options for the Metrorail Tysons to Dulles. Having Metro go through Westpark Drive is a very unstabilizing force for Building I and Building II of the Rotonda Complex of Condominiums (located between Westpark, International, Greensboro, and Springhill Drives). Thus for the safety of the residents of these units and the safety of their investments we urge you not to consider the plan T-4. (0028, 0028-L –1)

Public Comment: I am very much in favor of rapid transit and I appreciate the consideration for public comments. As a homeowner at the Rotonda I am very interested in the alignments proposed for Metrorail through Tysons Corner. There are more than 3000 residents at the Rotonda and large numbers of other residents in nearby condominiums and rental apartments. I believe these residents should not be subjected to the continual noise, vibration, and visual impacts of an elevated rail system running by their homes. (0124, 0124-E –1)

Public Comment: We would truly appreciate you reconsidering moving this project to the main corporate area of Tysons Corner for the convenience of the large corporation with their headquarters. (0033, 0033-CC-2)

Public Comment: Please reconsider construction of above ground rail system along intersection of International Dr. & Westpark. This is a residential area and the voice level will be very inconvenient to the residents of the Rotonda (8340 Greensboro Dr). (0033, 0033-CC-1)

Public Comment: We strongly oppose the Tysons Loop Alternative T4 with stations in the vicinity of Westpark Dr/Jones Branch Dr (Tysons Central A) and Westpark Dr/International Dr (Tysons Central B) for the following reasons:

- The median along Westpark Dr. is too narrow for the right-of-way/stations without severely narrowing or eliminating traffic lanes.
- There is no room for the two stations on Westpark Dr unless land is taken (purchased) from one or more of the adjacent properties (Right-of-way and Property Displacements).
- There will be vibration and train noise (Noise and Vibration).
- The view (Visual Aesthetics Impacts) for two of five Rotonda buildings will be destroyed thereby causing a decrease in property values for the entire complex (Secondary Impacts). (0021, 0021-L –2)

Public Comment: The above-ground option in Westpark is an abomination. The other rail options would really reserve the area. (0035, 0035-CC-1)

Public Comment: I object to the T-4 loop by the Rotonda as this would be outside my windows and this is very unfair as a taxpayer to do this to anyone. When I bought I never thought this is what could take place. Put it underground or keep everything on Route 7. (0037, 0037-CC-1)

Public Comment: All residents of 8340 Greensboro Drive better known as the Rotonda do not want your T4 Loop. Please choose any other alternative to the T4. (0057, 0057-CC-1)

Public Comment: I am strongly opposed to T-4. I live in the Rotonda and it would be right outside Building 2 & my part of building 1. They should go through a area that is all business. A lot of us are senior citizens & life savings invested in these properties. (0059, 0059-CC-1)

Public Comment: I am against metrorail's T4 option because it's in front of our windows, and will destroy our life! (0064, 0064-CC-1)

Public Comment: For this reason, I strongly oppose alignment T4. This aerial alignment has all the negative noise, vibration, and visual impacts on residents, and on overall environment and ambiance of the neighborhood. Alignment T4 is predicted to have higher annual operating costs and less ridership (both existing and new riders) than the other proposed alignments. Therefore it is hard to see a rationale for building T4. I would like to see alignment T4 eliminated from consideration. (01240124-E -2)

Public Comment: I am very much opposed to the potential plan of extending the metro rail loop or spur (T-4) from Tysons to Dulles behind Rotonda Bldgs. 1 & 2, 8340 & 8350 Greensboro Dr., via Westpark Drive. (0020, 0020-L –1)

Public Comment: I am against any "Rail Loop" going through, up, around, or anywhere near residential homes, such as the Rotonda. (0006, 0236-L –1)

Public Comment: The improvements to our transportation infrastructure currently being planned by various public entities are both complex and far-reaching. The improvements are, for the most part, anticipated by the owners of the Rotunda. One part of the plan being proposed for the rail improvements from Tysons Corner to Dulles airport, identified as option T-4, is strongly opposed by our residents. The T-4 option is an elevated rail loop that would traverse West Park Drive immediately opposite two-fifths of our residents. (0156, 0156-T –2)

Public Comment: NADA recognizes that the Draft EIS has identified problems with all the alternative alignments. Alignments T-9 conflicts with two planned highway interchanges, but neither of these have funding. While Alignment T-6 along with Alignment T-4 are the most costly, T-6 will have a substantially higher ridership. Both Alignments T-1 and T-6 will result in traffic tie-ups during the construction phase. Draft EIS 6-52 (ridership), 6-60 (cost). (0477, 0477-L –16)

Public Comment: Draft EIS at page 10-6. Although the goal of having a seamless system primarily relates to the type of rapid transit ultimately chosen, this attribute applies with equal force to the alignment alternatives that must provide for ease and continuity in using Rapid Rail [which Alignment T4 doesn't do]. (0477, 0477-L –15)

Public Comment: In short, we [The Rotonda] oppose any rail structure, either above or below ground, on any street adjacent to our property. The board of directors, and through them the ownership, are ready to meet with you and other representatives to further discuss the improvement plans, especially T-4. (0156, 0156-T –4)

Public Comment: One part of the plan being proposed for the rail improvements from Tyson's Corner to Dulles Airport, identified as Option T-4, is strongly opposed by our residents. The T-4 option is an elevated rail loop that would traverse Westpark Drive immediately opposite two-fifths of our residences. The anticipated noise, vibration and view stand to reduce the desirability of the affected units and thus reduce their resale value. This comment is based on the post construction value. The value of these units during construction would be even worse. This letter also represents the collective opinion of the Association Board. In short, we oppose any rail structure either above or below ground on any street adjacent to our property. (0220, 0220-M –1)

Public Comment: I have briefly examined the summary report document, as well as the traffic, transportation, ridership, and noise technical reports. Based on this limited review, I offer several observations that argue against the T4 alternative. - This projected difference in ridership between T4 and the other rail alternatives in not significant, and in some cases, serves fewer riders. (0429, 0429-E –2)

Public Comment: Opposes Alignment T4. (0511, 2-02)

Public Comment: Does not support Alignment T-4. (0513, 2-01)

Public Comment: Opposes Alignment T4 because it is too close to several residential communities (i.e., the Rotonda and the Lincoln). (0514, 2-01)

Public Comment: Opposed to Alignment T4 because it would cause maximum disruption and disturbance to the residential communities of the Rotonda and the Lincoln.(0515, 2-01)

Public Comment: Opposes Alignment T4. (0507, 2-01)

Public Comment: Opposes an elevated alignment close to the Rotonda, either on Westpark Drive or International Drive because the noise would undermine quality of life and property values. It would also increase the traffic problem around the Rotonda. (0332, 2-01)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in the selection of the Locally Preferred Alternative (LPA). The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the LPA. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Wants Final Plan to be Known

Public Comment: I'll want to know what the final plan is before voting the money. No more "maybe rail, maybe bus". The reason behind this: I need to know that multiple changes (between bus and train, or two trains) will not be necessary to get from the Dulles Corridor (Reston, in my case) to Washington. In fact no changes is by far better if you expect people to actually pay to ride this service, and use it with luggage (it is an airport link, after all). The overall issue is "long trip, waits for changes, forget it - - I'll risk the traffic and pay for parking". In case it isn't clear, I favor rail by far even if it costs more to build. (0114, 0114-E – 2)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension as the Locally Preferred Alternative. It offers a seamless connection with the Orange Line and all Dulles Corridor trains will proceed into the District of Columbia.*

Metrorail Alternative Will Take a Long Time to Build

Public Comment: In the area of promises, I lived here in Washington when we were going to build the Metro, we were going to build a 100-mile system, and we'll build it out in 10 yrs. Well, 15. I think a number of people have retired and their children have joined the project and retired, and it's still not completely done. So I'm with the people about it's going to take a long time. (0191, 0191-T –4)

> ***Response:*** *The commenter is correct in stating that it will take several years to complete final design and construction for the Metrorail Alternative. As explained in Chapter 2 of the Final EIS, the Metrorail Extension would not be complete until 2015, assuming that the Project is fully funded.*

Metrorail Doesn't Serve Everyone

Public Comment: I am representing commuters who travel from all over the area to come to work in Reston and elsewhere in the corridor. We are dispersed all over the region. We live and work in different locations. Going from one area to another can be a challenge. It used to be that people would go to work from their homes in the suburbs to downtown D.C. Metrorail works great for that. But what about the rest of us? (0183, 0183-T –1)

> ***Response:*** *The selected LPA, the Metrorail Extension, is primarily intended to serve long-distance trips between the corridor and the region's core. The proposed transit route is also attractive for short-distance trips between activity centers within the corridor, because it offers time savings over existing transit services in the corridor for these trips.*
>
> *Most travelers in the Dulles Corridor are coming from dispersed, lower-density locations throughout the region, and traveling to dispersed destinations throughout the corridor and the region (some high-density, some not). While travel within the corridor and between the corridor and the region is significant, travel from each dispersed location is, in general, not significant enough to support a dedicated, point-to-point type of service. On the other hand, the Metrorail Extension includes several stations that can efficiently provide access for many travelers heading to and from multiple origins and destinations.*
>
> *Although the Metrorail Extension would not serve the travel needs of all trip makers in the Dulles Corridor, it—in combination with the planned transit-oriented urban form—offers alternative means of travel for the growing number of residents, employees, and visitors in the Dulles Corridor, helping to increase overall mobility in the corridor, the counties, and the region. Other transportation improvements (both highway and transit) are recommended in the Northern Virginia 2020 Plan, the Statewide Transportation Plan, and local comprehensive plans. This program of improvements, which is being pursued by VDOT, DRPT, and others, is intended to increase mobility and address the existing and potential future deficiencies in Northern Virginia.*

Proposed Project May Not Be Convenient

Public Comment: Although the idea of rail or bus service to Dulles is a good idea, I don't know how much it will be used and thus how much it will alleviate the environmental concerns with commuting. Taking mass transit will likely increase my commuting time and time is as important as money (cost of commuting). With all the stops proposed for the rail, rail would probably take longer. And by the time the rail riders got to West Falls Church, if they had to change trains, they would never get a seat or even a space on the first train. (0011, 0011-E –1)

> ***Response:*** *As part of the analysis in support of the Final EIS, the Project Team estimated the number of patrons and the change in travel times for users of the Metrorail Extension. These results are documented in Chapter 6 of the Final EIS.*
>
> *The results show that the Metrorail Extension to Route 772 would attract 47,800 new riders in 2025 (the planning year). New riders are those who would not otherwise be riding transit without the Extension. The Metrorail Extension also results in improved travel times for most trips studied. Some of the shorter trips did not show improvement, but all of the longer trips, including the corridor to downtown DC trips that account for most of the travel on the line, showed significant improvement.*

Suggestions for Enhancing System Connections

Public Comment: In addition, accurate schedules should be provided at all stops for both local and express bus systems; improvements in neighborhood service should be made wherever and whenever such opportunities may occur; schedules should periodically be fine-tuned to fit changing demand; and timed-transfer services should be extended beyond our very successful Town Center demonstration operation to other major activity centers throughout the Dulles Corridor and beyond. (0478, 0484-E –19)

> ***Response****: Responsibility for the improvements and enhancements suggested by the commenter is the responsibility of the local transit operators in the corridor. These operators include the Fairfax Connector and Loudoun County. Implementing these improvements is outside the scope of this project.*

Suggestions for Different Routing

Public Comment: We have some specific concerns regarding the Loudoun portion of the Dulles Rail project. We believe consideration should be given to running the rail up Route 28 and out Route 7 to connect to existing communities rather than be used to open up a completely new area to development. It would help to know how this would affect ridership and development patterns. We have concerns about proposals for as much as 16 million square feet of commercial development at the end station, what is being called Moorefield Station. While we support transit-oriented development, this is overkill given the vast amount of land already available for commercial development and this amount of office and commercial will prompt sprawl far to the west. (0149, 0205-M –4)

Public Comment: We believe consideration should be given to running the rail up Route 28 and out Route 7 to connect to existing communities, rather than be used to open up completely new areas to development. It would help to know how this would affect ridership and development patterns. (0251, 0251-T –6)

> ***Response:*** *The Loudoun County Revised General Plan and Countywide Transportation Plan has governed the general routing of the Project. The Project Team did not, therefore, entertain an alternate route or corridor, which did not conform to the County plans. The Revised Countywide Transportation Plan (adopted July 23, 2001) and the Revised General Plan (adopted July 23, 2001) specifically identified the Dulles Corridor Rapid Transit Project as a priority, and identified the same routing and stations for the project as proposed in the Draft EIS and as documented in*

the Final EIS, both in the text and on accompanying maps. Heavy rail transit has not been identified along Route 28 or Route 7, though these have been identified as transit corridors.

The commenter's proposed routing for the corridor would have also been inconsistent with another regional plan, the Northern Virginia 2020 Plan. This plan identified a light rail line extending along Route 28, and with a terminus north of the Dulles Toll Road, but south of Route 7. No future transit lines were identified along Route 7. Transit-oriented development and implementation of any site-specific private development opportunities within the corridor is under the control of local jurisdictions.

Need Further Investigation of Underground Alignment

Public Comment: At the earlier scoping hearings, I asked or suggested that the alignment through Tysons Corner be completely underground - from where it leaves the Dulles International Airport Access Highway to where it returns to it. As far as I can tell, this either was not investigated or the results were not made public. So I am asking again - what would be the additional cost to place the T6 alignment completely underground? Is it technically feasible? (0074, 0074-CC-1)

Public Comment: Underground on Rt. 123 as soon as trains leave Dulles Access Road. (0061, 0061-CC-2)

Public Comment: Are we politically and economically between such a terrible rock and a hard place that this is the best we can do at Tysons? Is there absolutely no solution we can afford that avoids miles of elevated tracks? Is the cost of an underground line along Routes 7 and 123 absolutely prohibitive? (0088, 0088-L –2)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

In response to the above requests during the public comment period of the Draft EIS, the Project Team evaluated the suggested alternative using the same social, environmental, economic, and transportation factors used for the evaluation documented in the Final Alternatives Analysis Report *(May 2001). This new alternative, called Alignment T13, was identical to Alignment T6 except that it would have transitioned to an underground alignment in the median of the Dulles Connector Road, and continued west through Tysons Corner in a tunnel. The alignment would have resurfaced in the median of the DIAAH on the west side of Tysons Corner. All four stations for the alignment would have been underground. Alignment T13 was not recommended for further consideration in the Dulles Corridor Rapid Transit Project. The reasons for this recommendation are summarized below.*

Though Alignment T13 would have mitigated the visual and noise effects associated with Alignments T6, these effects could be mitigated through much lower cost mechanisms. A draft cost estimate for Alignment T13 indicated that it would have cost approximately $422 million more than Alignment T6 (the most expensive Metrorail alignment). Visual and noise effects for Alignment T6 are not expected to be substantial.

Alignment T13 would also have had additional costs and schedule risks. While it is customary to assess higher cost and schedule contingencies to underground construction to cover these potential exposures, it is not reasonable to assign a sufficient contingency to cover every risk, and maintain a level comparison among alternatives. Most of the significant risks relate to unknown subsurface conditions. Risks include escalating project costs; severe schedule impacts, leading to additional cost escalation; increased inconvenience to the public; and even delays in opening the project. The full evaluation for Alignment T13 is documented in a technical memorandum, now part of the Final Alternatives Analysis Report Addendum (October 2004).

Suggest Further Evaluation of Other Alignment Options

Public Comment: We recommend full evaluation of the following option: Building the first operational capability the length of the corridor down existing rights of way with on-grade stations and parallel with construction of Tysons Corner and Dulles loops. Adding the T-8 alignment down the Dulles connector road to the T-1, T-6 or T-9 alignment selected for Tysons Corner should save lapsed construction time and provide a permanent express route to the airport. This combination could give Tysons Corner and the rest of the corridor service around 2006 and appears compatible in cost and service to the T-4 option. (0170, 0170-T –7)

Public Comment: 2010 is a long time to wait for service. We are particularly concerned that the Tyson's Corner alignment will significantly delay service to the rest of the corridor. We recommend evaluation of a combination of the T-8 alternative (or something like it) with T-1 (or 6 or 9) and building - parallel with the construction of the Tyson's alignment -- the first operational capability the length of the corridor down the existing rights-of-way with at-grade stations. (0233, 0426-M –4)

Public Comment: I would favor building the line through from Falls Church to Dulles on the Dulles Corridor immediately and adding the Tysons' loop and the other stations, which will take more time to build, in parallel sequences, so that connectivity is achieved from D.C. <--> Dulles Asap. (0083, 0083-CC-2)

Public Comment: We recommend full evaluation of the following option: building the first operational capability the length of the corridor down existing rights-of-way with on-grade stations, in parallel with construction of the Tysons Corner and Dulles loops. Adding the T8 alignment down the Dulles Connector Road to the T1, T6 or T9 alignment selected for Tysons Corner should save elapsed construction time and provide a permanent express route to the Airport. This combination could give Tysons Corner and the rest of the corridor service around 2006, and appears comparable in cost and service to the T4 option. T8 is not a current rail alignment, but was studied previously and is in the BRT alternative. Evaluation of this combination should not unduly delay the EIS. (0210, 0210-M –4)

> ***Response****: The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*
>
> *In response to the above requests, the Project Team evaluated the suggested alternative using the same social, environmental, economic, and transportation factors used for the evaluation of alternatives documented in the Final Alternatives Analysis Report (May 2001). This new alternative, called Alignment T12 was not recommended for further consideration in the Dulles Corridor Rapid Transit Project. The reasons for this recommendation are summarized below.*
>
> *Alignment T12 would have numerous deficiencies relative to the alternatives previously considered in the Final EIS. These deficiencies include increased costs, substantial impacts associated with shifting roadways to accommodate the alignment, reduced ridership, and operational complications. The full evaluation for Alignment T12 is documented in a technical memorandum, now part of the Final Alternatives Analysis Report Addendum (October 2004).*

Need to Access Office and Residential Development

Public Comment: Two possible alternatives identified below may (to different degrees) address the need to access the office and residential development in this area near Westpark Drive. These additional alternatives should be considered and compared to the current proposals in such areas as ridership potential both with and without an internal circulator system of shuttle busses, taxis, etc and the attendant surface facilities to accommodate these modes, costs, construction impacts, operational impacts and other environmental concerns such as noise, air quality, etc.

A. A variation of T4 which would propose double tracks along the Westpark Drive portion of the alignment between Route 7 and 123 and eliminate the single track segment between West Park Drive and 123 east of the Beltway. The alignment would include Tysons West, Tysons Central A, Tysons Central B and Tysons East Stations. It is recognized that this alternative would not serve the area along Route 7 near 123 nor would it connect directly to the two Tysons shopping centers. But these two areas could be served via an internal circulator system if one were provided. I would expect that the ridership analysis would assess the station location implications. (0387, 0387-L –4)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The visual effects of this proposed alignment would have been substantial. As discussed in Section 3.4 of the Draft EIS, Alignment T4 was expected to have much more substantial visual impacts than the other Metrorail alignments, due to the leg running along Westpark Drive—a relatively narrow, tree-lined street with many residential viewers. The aerial structure in this location would have been out-of-scale with the existing development and would require the removal of street trees. The alignment was also expected to have direct visual impacts on an adjacent hotel and office building along Westpark Drive. The effects of Alignment T4 along Westpark Drive could have only been mitigated by relocating the facility elsewhere. Adding a second track to Alignment T4 would have only exacerbated visual impacts that were already extremely difficult, if not impossible to mitigate, unless the alignment was moved.

Alignment T6, on the other hand, will have far less substantial visual impacts. Because the elevated portions of Alignment T6 primarily extend along relatively wide roadways, the visual impact for this alignment would generally not be as substantial. In addition, Alignment T6 includes lengthy underground sections along Route 123 and Route 7, reducing the visual effects of this alignment. Given that Alignment T6 is expected to attract high levels of ridership and primarily have moderate visual impacts, the commenter's suggested alternative was not recommended for further consideration in the Dulles Corridor Rapid Transit Project.

As outlined in Chapter 2 of the Final EIS the Metrorail Extension includes feeder bus service at all of the stations.

Suggests a Shuttle Concept in Tysons Corner

Public Comment: B. The second alternative is mainly an operational alternative related to T4. The one physical modification is to include a double crossover inbound of the Tysons West station. This alternative would supplement the regular through rail service (including "through service" that would terminate at Tysons West under the BRT/Metrorail and the initial phase of the Phased Alternative) with an internal Tysons Rail Shuttle service between the Tysons East and West stations. This would provide more frequent service between the single track Tysons Central Stations and the transfer stations at Tysons East and West where riders could board trains destined to stations inbound or outbound of Tysons. While this wouldn't totally eliminate the ridership loss associated with a required transfer, it would make the transfer as convenient as possible thereby minimizing any potential ridership loss. This shuttle concept has another positive benefit of providing high quality transit service within the Tysons area thereby reducing the need to depend on the private auto for internal trips for work, shopping, dining, etc. (0387, 0387-L –5)

Response: *The LPA includes Alignment T6 in Tysons Corner. Its rail geometry precludes a double cross-over inbound of the Tysons West Station. Moreover, since Wiehle Avenue Station will be the interim terminal station of the first phase of the LPA, there will be no turnback function at Tysons West Station.*

Suggests Operational Changes at Tysons and Reston

Public Comment: I believe both Tysons and Reston have unique internal movement issues that cannot be solved by multiple heavy rail stops. In fact, multiple stops in these areas will distract from the overall system. The airports are good examples of integrated solutions. The rail serving National Airport, for example, does not go to each major air carrier. Instead, they come to a single location and redistribute their passengers to the desired airline destinations. In this manner they only expedite the trip - not only expedite the trip, but make – more importantly, they retain the flexibility to reconfigure their internal transportation as the airport business environment changes. And I think we are going to see the same kinds of things in these regional areas. It is this flexibility that I believe would be retained if we create only one stop at those major population centers that really need their own internal transportation and distribution systems. And that would kind of facilitate the bus rapid transit. (0148,0250-T –3)

Public Comment: Preferred option would be to have Metrorail run along the DIAAH with a stop at the Tysons-West*Park Transit Center (0512, 2-02)

Public Comment: Routes thru Tysons are foolish & add enormous cost. Better to keep rail in the Dulles Road median & use monorail to service Tysons. (0073, 0073-CC-3)

Response: *Appendix H of the Final EIS (Alternatives Previously Considered), and the Project's Final Alternatives Analysis Report (May 2001), both discuss the Alternative T8 as a Metrorail bypass of Tysons Corner. As explained in the Final Alternatives Analysis Report, this alternative, which was suggested during the Project's scoping process, was eliminated from further consideration during the screening of alternatives. The analysis for this alignment option showed that bypassing Tysons Corner offers very little travel time savings. Moreover, given the length of most trips on the transit line, the time savings would be considered negligible. In fact, a larger number of Metrorail stations in Tysons Corner, rather than one, expedites trips for many travelers because it provides more direct access to many locations and does not force a transfer to another mode for distribution.*

Alignments that included connections to feeder systems within Tysons Corner were requested during the Scoping Process for the preparation of the Draft EIS. These alternatives were evaluated during the early stages of the Dulles Corridor Rapid Transit Project, and were eliminated from further study as detailed in the Final Alternatives Analysis Report.

Use Some Traffic Lanes for Transit Service

Public Comment: The [Pittsburgh East] bus rapid transit system also includes dedicated bus lanes in the downtown core and in the satellite employment center of Oakland, which tends to illustrate the flexibility of the bus rapid transit system in Pittsburgh, in Westmoreland County, to the buses down the busway into downtown Pittsburgh, if they just get a permit from Port Authority Transit and they are ready to roll. Here you could create loops that go through Tysons on bus lanes on the surface streets, go out to say Leesburg or to Ashburn or to Cascade or to Sterling Park or Herndon, and in the intermediate using part of the bus rapid transit system. (0255, 0255-T –4)

Public Comment: Quality of life issues with an aerial alignment or the construction of a tunnel on Westpark Drive, International Drive, and Spring Hill Road. Any of the other MIS Alignments (T1, T6, T9) would be preferred because they would not be located in dense residential areas. The BRT Alignments (BRT 1, BRT 2, and BRT 3) would provide the quickest solution to mass transit if the following were considered: dedicated bus lanes, the construction of a parking garage at the Tysons-West*Park Transit Center, and additional parking along the bus routes. (0515, 2-02)

Response: *BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

As described in Chapters 2 and 6 of the Draft EIS and Final EIS, several roadway capacity improvements are planned for Tysons Corner over the 20-year planning horizon, including

roadway widening and construction of grade-separated interchanges. VDOT and Fairfax County believe that these capacity improvements will be needed to meet increasing demand for travel to, from, and through Tysons Corner. However, as shown in Section 6.1 of the Draft EIS and Section 6.2 of the Final EIS, very few of these improvements are actually expected to improve the level of service on Tysons Corner roadways between 2000 and 2025. Many roadways are expected to experience worsening conditions, while others will remain at their current state of congestion.

Given that many roadways in Tysons Corner are expected to operate at or above capacity in the future, even after capacity increases, the roadway operators (including Fairfax County and VDOT) would have been unlikely to dedicate traffic lanes for transit service.

Concerns About Route 772 Station

Public Comment: Third, the Greenway suggests that the rail line terminate at the Route 606 station for several reasons. First, terminating the line at Route 606 will minimize the impact of this project on the Greenway and its customers. Second, Loudoun County's planning and zoning process does not support any significant parking near the Route 772 station, whereas the Route 606 station will have approximately 4500 parking spaces. We question the benefit of the Route 772 station in the absence of ample parking. (0257, 0257-T –8)

Public Comment: The Greenway suggests that the rail line terminate at the Route 606 station, for several reasons: First, terminating the line at Route 606 will minimize the impact of this project on the Greenway and its customers. Second, Loudoun County's planning and zoning process does not support any significant public parking near the Route 772 station, whereas the Route 606 station will have approximately 4500 parking spaces. We question the benefit of the Route 772 station in the absence of ample parking. Third, as a major Loudoun County taxpayer, the Greenway is concerned that the financial impact on Loudoun County of becoming an active member of the WMATA compact has not been discussed, and that the operational and capital improvement subsidies to be paid by Loudoun County to obtain benefits from the availability of mass transit while minimizing the capital cost and the subsidies. (0257, 0268-M –5)

Response: *As shown in Table 6.2-2 of the Final EIS, in the long-term, the Full LPA is not expected to worsen or improve traffic conditions on the Dulles Greenway. Under the 2025 No-Build Alternative and the 2025 Full LPA, between Route 772 and Route 659, the Greenway is expected to experience traffic volumes of 8,100 vehicles in the peak direction in the peak hour. This traffic volume results in LOS F for both alternatives, a level of service that reflects severely congested or gridlock conditions.*

During the construction of the Full LPA, it would be necessary to permanently relocate the lanes on the Dulles Greenway around the Route 606 and Route 772 stations and around the yard leads for the Metrorail Service and Inspection Yard. DRPT and WMATA would coordinate with TRIP II on the application of best management practices to minimize the disruption of traffic. These practices would be modeled after TRIP II's recent experience during the widening of the Dulles Greenway from four to six lanes. With respect to construction of the Metrorail line, yard leads, and stations in the median of the Greenway, again best management practices would be used for construction methods, access, haul routes, etc., to minimize disruption of traffic. Installation of the four pedestrian bridges over the Dulles Greenway will have minimal impacts, because any lane closures will be during off-peak hours, when traffic volumes are lowest.

As evaluated in the Supplemental Draft EIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces.

Suggests Operational Changes

Public Comment: The environmental impact is greater with the rail proposals than with the bus rapid transit proposals, but once again, I think that what you need to do here is to scale back the number of stations and maybe end this thing at Dulles airport, get rid of some of the ones at Tysons, and really start to get some change in Tysons and other land use densities now before you can justify fixed rail there. (0112, 0245-T –11)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

The terminus of the Locally Preferred Alternative is located in eastern Loudoun County in accordance with the Loudoun County Revised General Plan and Countywide Transportation Plan, and responds to anticipated growth in this portion of the county over the next 25 years.

As outlined in Chapter 10 of the Draft EIS, Metrorail (with multiple stations in Tysons Corner) will have several benefits relative to BRT. In general, Metrorail will be providing greater improvements in transportation service, greater increases in transit ridership, more support for future development, and it would better serve diverse populations.

Specifically, Metrorail will have the highest ridership, highest number of new riders, and highest corridor transit mode share among the Build Alternatives evaluated in the Draft EIS. Metrorail will be the most time competitive with automobiles for trips within the corridor. For these trips, as well as trips to and from the corridor, Metrorail will require the fewest number of transfers. Metrorail will provide greatest increase in person-capacity in the corridor. Metrorail also will provide the greatest benefits for the Orange Line, in terms of relieving overcrowding on the Vienna service.

In addition, Metrorail will support comprehensive plans in Tysons Corner better than BRT, and better will enhance Fairfax County's ability to focus growth in the corridor. As indicated in Chapter 9 of the Final EIS, the allowable transit-related growth will result in an increase in development in the immediate vicinity of stations throughout the corridor, but will not represent a dramatic increase over the overall level of growth allowed in Fairfax and Loudoun counties, as defined in their land use regulations. Rather, the comprehensive plans refocus the previously anticipated levels of growth into patterns that will increase the number of viable travel options available to corridor residents and employees, including transit, walking, and bicycling. As an additional benefit, compact development will reduce the cost of providing utilities, facilities, and services to new residential and commercial developments. The former, dispersed pattern of development would have been highly auto-oriented, leaving people with few travel choices and resulting in wide-spread congestion. While it is expected that increased density will result in localized traffic congestion in station areas, the new, transit-oriented urban form will help to increase overall mobility in the corridor, the counties and the region. Although these policies are intended to support transit within the corridor, the increase in growth associated with these policies is not part of the project justification.

The proposed Metrorail stations are at the locations determined to best respond to anticipated demand. Therefore, stations are located at existing and planned activity centers in the corridor and at existing park-and-ride locations. Average spacing for most stations in the Dulles Corridor is approximately one to two miles, which is consistent with that for heavy rail lines in general. In Tysons Corner, station spacing is somewhat closer, similar to station spacing in a high-density, metropolitan downtown. Given that Tysons Corner is currently larger —in both geographic size and employment—than many of the central business districts in major U.S. cities, and is one of the largest suburban business districts in the country, the number of stations proposed for this area is not unwarranted.

Supports Existing Washington Flyer System

Public Comment: Those of us in the vicinity of the West Falls Church Metro station (and anyone who can get to that station) already have a highly efficient public transportation system to Dulles, in the form of the Washington Flyer shuttle buses that leave the station two or three times an hour and get to Dulles nonstop in less than 20 minutes, arriving just outside the terminal. If that system were to be replaced by the proposed rail system, we would be required to take the Metro back to East Falls Church and reboard there on a train or bus going to Dulles and then ride through numerous stops before reaching Dulles. (0307, 0307-E –1)

> ***Response:*** *The commenter is correct in stating that passengers in the West Falls Church vicinity wishing to travel to Dulles Airport would transfer to the Dulles Corridor line at East Falls Church Station. The travel time from the East Falls Church Station to Dulles Airport Station is approximately 33 minutes. The travel time for Washington Flyer coach buses from West Falls Church Station to Dulles Airport Station averages 20 to 30 minutes, but is subject to change based on traffic and weather conditions. The frequency of Metrorail trains will be every 7 minutes during peak periods while the Washington Flyer coach buses are every 30 minutes.*
>
> *The Washington Flyer stop is two lanes from face of the terminal, while the center of the Metrorail platform is approximately 190 feet from the face of the terminal (to preserve MWAA's ability to construct its automated people mover system). The Metrorail travel path is completely enclosed whereas the Washington Flyer is not.*

B. Supplemental Draft EIS Comments

State Agency Comments

Effects of Phasing Issue

State Comment: If construction of Phase 2 is delayed, how will the Project address outstanding Phase 1 issues that will become prolonged and more critical as a result of this delay? (0091 0106-1)

> ***Response:*** *The Wiehle Avenue Extension was evaluated as an independent, stand-alone project in the forecast year of 2025. As such, the Final EIS documents potential effects of having the Wiehle Avenue Extension in operation past year 2011.*

Need to Identify Bicycle and Pedestrian Improvements

State Comment: The Supplemental DEIS states that the implementation of the design changes to the proposed LPA would have no additional effects on the existing and planned bicycle and pedestrian facilities in the Dulles Corridor. Although there would be no additional effects, please indicate how the Project will provide adequate bicycle and pedestrian access to the stations. (0091 0106-18)

> ***Response****: DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*

All stations will have bicycle racks and/or lockers adjacent to station entrances. Specific quantities will be determined as part of final design.

Parking Issues in Tysons Corner

State Comment: "…the reduction in parking capacity at this station (Tysons West) would result in a considerable decrease in project-related trips at the Tysons West Station for all years. However, this reduction would not necessarily result in significant improvements to traffic impacts, over those presented in the Draft EIS for the Metrorail Alternative (T6/Y15), since the background traffic volumes would remain extremely heavy near the station area…" Eliminating the formerly proposed large parking structure will result in less impact to the local road network from vehicles anticipated to use the parking structure, than that identified in the DEIS. However, the smaller parking facility will generate additional conflicting (left turn) movements. (0091 0106-9)

Response: *For Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.*

The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known. The park-and-ride would be accessed from local roads, and its cost is part of Wiehle Avenue Extension.

As shared with stakeholders in the Dulles Corridor, the Project Team notes that the traffic conditions of station access should not be a major concern to VDOT. The peak activity at the station will be early on weekday mornings and this small park-and-ride structure will likely be full before the local peak hour of Tysons Corner. For instance, the final park-and-ride customers of Metrorail would arrive before 7:00 a.m., while the local peak hour would be between 7:30 a.m. and 8:30 a.m.

Parking Issues at Herndon

State Comment: "With the design modifications, the effects of the proposed LPA would be similar to those presented for the Metrorail Alternative (T6/Y15) in the Draft EIS. However, if the full LPA is not constructed, 2,450 parking spaces would be constructed at the [Herndon-Monroe] station by 2025 to accommodate increased demand for transit services in the corridor." Since FTA is only considering funding Phase I at this time, it is unclear when the need for these spaces would be determined. Please clarify. (0091 0106-14)

Response: *Additional parking spaces at this station would be built as part of the LPA but would not be included under the Wiehle Avenue Extension. If the full LPA were not constructed by 2025, additional parking for express bus service would be needed at Herndon-Monroe and would be addressed by Fairfax County.*

Parking Issues at Other Locations

State Comment: "Based on the mode of arrival data presented in Table 6.2-5, the project related traffic effects of the proposed LPA and proposed LPA Phase 1 are anticipated to be significantly less than those presented in the Draft EIS for the Metrorail Alternative (T6/Y15), due to a reduction in parking capacity at the Route 606 Station. However, this reduction would not necessarily result in significant improvements to traffic impacts, over those presented in the Draft EIS for the Metrorail Alternative T6/Y15), since the background traffic volumes would remain extremely heavy near the station area." Please explain the rationale for reducing parking capacity at this location and consequently, the impacts to roads and other parking facilities along the line. (0091 0106-15)

Response: *In the Draft EIS, the Route 606 Station was intended to supply all of the parking for the two Loudoun County stations because the area surrounding the proposed Route 772 Station was planned as a high density, pedestrian-oriented development. Loudoun County had requested that no parking be developed at Route 772 because it was incompatible with this type of development. Public comments during the Draft EIS public hearings, as well as subsequent analysis, led the County to amend its request. Because of the addition of parking at Route 772, peak hour traffic would increase relative to the numbers given in the Draft EIS; however, plans for access paths to this station would be designed to accommodate this level of traffic.*

Potential Need to Conduct Noise Studies

State Comment: Relocation of Traction Power Substation #2 to the southwest quadrant of the Magarity Road underpass of the Dulles Connector Road

"..The new location is undeveloped public land of the Dulles Connector Road but on the residential side of the Road's wooden noise wall. The land is owned by FAA, leased by FAA to MWAA and maintained by VDOT."

The wooden fences along the Dulles Connector Road are basically for screening, not sound attenuation. These should be referred to as fences or some term other than "noise walls". If actual noise walls are necessary, the appropriate studies would be required to be performed and the materials would be required to meet the current FHWA/VDOT standards. (LD) (0149, 2-01)

Response: *The Project Team has chosen to use the term 'noise wall' for these wooden structures because they were originally designed and constructed as such by FAA to mitigate highway noise from the Dulles Connector Road.*

Construction of Noise Walls

State Comment: Option A location of Tie Breaker Station #2
"The Team recommends that a new wooden noise wall surround the TBS-2 for its security, for enhanced community safety, and for aesthetics of the neighborhood."
VDOT does not recommend the use of "wooden noise walls" because they are too noise reflective and not sufficiently noise absorptive. Consequently, VDOT generally does not use wooden noise walls in its projects and has no approved design specifications for wooden noise walls. Use of wooden noise walls would be considered acceptable by VDOT only under very rare and special circumstances, such as at locations where there are requirements for very shallow noise wall foundations that could not support heavier, concrete walls.

All noise walls within VDOT Rights-of-Way (R/W), whether constructed by VDOT or others, must be designed and constructed in accordance with VDOT's sound barrier design, construction and materials specifications. (ENV) (0149, 2-02)

Response: *The ownership, operation and maintenance of the Dulles Connector Road are unique. The Federal government owns the right-of-way and leases it to MWAA, but VDOT operates and maintains the roadway, its roadside, and the wooden noise walls on MWAA's behalf. The Project Team has presumed that the existing wooden walls were built in accordance with standards in effect at the time of their construction. Any section of these walls removed or relocated as a result of the Project would be constructed of like materials.*

Local Agency Comments

Pedestrian and Bicycle Issues in Tyson Corner

Local Comment: Pedestrian access to all stations needs greater attention from the Project Team. Station plans should clearly show pedestrian access points and necessary adjacent facility improvements such as cross walks and sidewalks/trails. Station plans should clearly show pedestrian access points and necessary adjacent facility improvements such as cross walks and sidewalks/trails. Alternate points of access to the Tysons West and Tysons Route 7 Stations should be evaluated. Staff is collaborating with a subcommittee of the County Non-Motorized Transportation Committee to identify pedestrian facility improvements that should be constructed between now and the initiation of rail service. (0083 0098-2)

Local Comment: Wiehle Avenue station: On the south side of the station, a pedestrian connection to the west should be provided that connects to a sidewalk on Association Drive or Commerce Park Drive; this connection should provide improved access from the residential areas along Soapstone Drive. (0093 0109-16)

Local Comment: Vol. II, p. 080 show pedestrian (e.g., crosswalks) improvements. (0093 0109-8)

> ***Response****: DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, though, coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*
>
> *All stations will have bicycle racks and/or lockers adjacent to station entrances. Specific quantities will be determined as part of final design.*

Local Comment: At the Tysons West Station, consideration should be given to locating the parking facility and pedestrian access on the south side of Tyco Road. Locating the parking structure on the south side Tyco Road may be more favorable to joint development. Locating pedestrian access on the south side of Tyco Road may serve a greater number of pedestrians. (0083 0098-4)

> *For Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.*
>
> *The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known. The park-and-ride would be accessed from local roads, and its cost is part of Wiehle Avenue Extension.*

Local Comment: Section 6.3.2 With Wiehle as the Interim terminal station, will there still be no additional effects on bicycle and pedestrian facilities with the LPA Phase 1?

> ***Response:*** *Chapter 6 of the Supplemental Draft EIS addresses the physical effects of the proposed Dulles Corridor project on existing and planned pedestrian and bicycle facilities. The*

LPA and the Wiehle Avenue Extension are not expected to affect any existing or planned facilities in the Wiehle Avenue Station area.

Other Specific Pedestrian and Bicycle Issues

Local Comment: Vol II, p. 081 there are 2 "emergency stairs" proposed for the station. Could one of them be upgraded for use by regular pedestrian traffic? (0093 0109-10)

***Response**: No, the emergency stairs are for egress during station evacuation. Moreover, the stairs are not connected to the station mezzanine with its fare gate array.*

Parking Issues at Wiehle Avenue

Local Comment: The Board requests that construction of the parking structure at the Wiehle Avenue Station no[t] commence until the Full Funding Grant Agreement for Phase II is executed. However, deferring such construction should not preclude land acquisition and station access improvements at this station. (0083 0098-1)

***Response:** The following final recommendation of the Project Team explains the need for the park-and-ride at the start of Metrorail operations. With the exception of a new roadway connection to Sunset Hills Road, these station facilities would be situated upon the Reston East park-and-ride lot owned by Fairfax County. In the context of the Corridor's travel demand and of project justification by Federal criteria, there is a very important need to have adequate facilities at the end-of-line station at the start of Metrorail operations. The Project's goal of improved mobility must be supported by complete access to the station. With respect to the Federal criteria, FTA is placing increased emphasis on the cost-effectiveness of projects proposed for funding; the cost-effectiveness measure relies on the transportation benefits of the Project. Not to have the transportation benefits that the recommended park-and-ride facility offers would lower the FTA's rating of the Project and thus affect its prospect for funding. In addition, the Project's operating funding plan relies on the forecast ridership and revenue; reduced access translates into higher public subsidy.*

General Parking Issues

Local Comment: Vol. II, p. 080 Option B appears to better fit the "mixed use" concept for land use near the station. Clarify which improvements are proposed with the project, and for those that are not, include them in the mitigation chart, 6.2-7. (*0093* 0109-7)

***Response:** In accord with the final Team recommendations for Wiehle Avenue Station, the final General Plans include a site plan that accommodates future joint development at the station. The site of the joint development would be on the current Reston East park-and-ride facility along Wiehle Avenue. Chapter 6 of the Final EIS involves a summary of the mitigation measures for transportation effects.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.

Local Comment: Table 6.2-1 Does this take into account the proposed parking garage addition? (0093 0109-3)

***Response:** Yes. The data in Table 6.2-1 of the Supplemental Draft EIS was based on travel demand forecasts and traffic analysis with the park-and-ride structure of West Falls Church Station complete.*

Tysons West Station Alternatives

Local Comment: While Option E is an acceptable option and logical based on the Post-Hearing Conference, the County would like to pursue an option that uses the site of the Fire Station 29 for the rail station facilities. Such an option would require the relocation of Fire Station 29 to the current site of the Tysons West*Park Transit Station at the intersection of Jones Branch and International Drives. This option is referenced Option F below:

Option F has some advantages that make it worth further consideration:

- Provides a less constricted area for the bus bay and kiss-and-ride area.
- Has fewer business effects and requires less property acquisition.
- Provides two access points to the station facilities and provides a road connection between Spring Hill Road and Tyco Road.

A Proffered Condition Amendment ("PCA") and the removal of restrictive covenants are required for the Tysons-West*Park site to be converted to a fire station.

To finance the construction of the fire station, project funds from the cost-savings of implementing Option F would need to be transferred to the fire station construction. A market value for the County-owned land would need to be determined.

Logistically the fire station must be operational prior to closure of existing Fire Station 29. Consequently, it may be necessary to relocate the bus passenger transfer activity to an interim site during construction of the new fire station.

If Option F proves not to be feasible and Option E is advanced, we would like the road connection to Spring Hill Road to be included in the Rail Project, provided that the concerns related to the operation of the Fire Station 29 can be satisfactorily resolved. (0093, 2-01)

> ***Response:*** *The June 2004 recommendation of the Project Team still applies for what is now a formal County proposal. "If additional coordination on this issue is timely and formally requested by the County, the Team may consider an alternative site plan to Option E that might have less effect upon the Cherner Automotive Group's operations. DRPT will decide whether the schedule for the project's implementation can accommodate this alternative site plan, if it is formally advanced."*
>
> *Additional analysis would be required to determine if there are any cost reductions between Options E and F. DRPT will coordinate with Fairfax County during preliminary engineering to monitor the further development of Option F, assess its associated costs, and determine if it is a viable replacement for Option E.*

Public Comments

Potential Effects of Station Construction on Property Values

Public Comment: Option A would directly and significantly diminish the value of the property and would directly diminish the value of property of my neighbors in the [Baldwin Drive] cul-de-sac.

o ….we urge the Project officials to locate the [access drive] roadway parallel to and alongside of the property line separating the Kalet and Whitaker properties.

o …we are adamantly opposed to any surface [of the access drive] that is inconsistent with the neighborhood, including loose stone, paved stone, or pavement of any kind. …we urge Project officials to

select either the open concrete block or geo-grid materials for the roadway, since this is aesthetically and functionally superior to any other surface…Since the [tie breaker station] apron serves as a turn-around surface for vehicles that will access the building, we urge Project officials to construct the apron from the same material used on the roadway, which will also address drainage issues.

In light of the residential nature of the building's setting, we request that the building have the following characteristics:

Building color matching the color of the Kalet house;
Two-pitched, shingled roof matching color/material of the Kalet roof;
Gutters and downspouts consistent with the Kalet house; and
Surrounding grounds sloped to drain water away from Kalet house/yard.

Project officials should adopt a standard of status quo ante, that is, restoring the property to its pre-construction condition to the fullest extent possible. Under this standard, the Project would be responsible for:

Relocating arbor on Kalet property to location acceptable to Kalets;
Protecting existing trees as much as possible;
Planting white pine trees generously to mask the building's presence;
Restoring yard to preconstruction condition, including drainage;Replace wooden soundwall with conventional concrete soundwall that is ten (10) feet taller than the wooden soundwall. Soundwall color on side visible from the Baldwin Drive to match the color of the existing wooden soundwall.

I urge Project officials to adopt the following: upon written notice to WMATA from the Kalets of an impasse on any of the issues identified in these comments, WMATA would be required within ten (10) days to retain the services of an independent architect for purposes of non-binding arbitration…At this juncture, DRPT officials may not have the authority or ability to address the details identified in the Substantive Comments section …. But DRPT officials have the authority and the ability to direct their project manager, WMATA, to follow a mechanism that would ensure an effective check against arbitrary action by WMATA personnel…requiring WMATA to hire an independent architect for non-binding arbitration…(0025, 2-01)

Response: *The Project Team has recommended Option A as the location of TBS-2.*

The implementation of the detailed recommendations should mitigate any effect of TBS-2 on residential property values. DRPT will compensate the owner of 1836 Baldwin Drive for the permanent easement for the access driveway and apron at fair market value. TBS-2 itself will be located within the existing public right-of-way for the Dulles Connector Road. The Team recommends that that a new wooden noise wall surround the TBS-2 for its security, for enhanced community safety and for the aesthetics of the neighborhood. Since TBS-2 would not be visible from the Baldwin Drive neighborhood, it would not receive any architectural treatment. The new wooden noise wall would have doors at the location of the doors of the TBS-2 and the remote train control room. The height of the new wooden noise wall would be sufficient to screen the TBS-2, which has a height of 13 feet.

As currently planned, the location of the access driveway and any temporary construction easement will be fully within the property of 1836 Baldwin Drive. The centerline of the access driveway will be parallel with the property line between 1836 and 1838 Baldwin Drive. The driveway and apron of TBS-2 might be of alternate materials, such as geo-grid or open concrete block with grass turf in their cells; the type of materials will be determined during preliminary engineering and final design. During the same phases, the drainage of the TBS-2 site, including its driveway and apron, will be addressed. Specific arrangements regarding landscaping and mitigation of construction impacts will be addressed with affected property owners.

The Project Team will continue to coordinate with affected property owners on the design of this facility and construction scheduling.

Need to Reduce Visual Impacts of Station Buildings

Public Comment: …try to minimize the visual impact by locating as much of the building as possible on the Access Road side of the wall…

…and make the front of the building blend with the wall or a color that blends with the foliage.

It would be better if the 20? apron would be made of the something other than concrete, perhaps the blocks that allow grass to grow through the openings.

The driveway access from the cul-de-sac to the building may have to be wider for the construction phase but it would be less objectionable if the final access were build as narrow as possible to accommodate that pickup truck which you say will visit the site only once a month.

Currently there are mature flowering cherry trees, pink dogwoods, Leland Cyprus trees and landscaped flower beds lining both sides of the property line that provide both beauty and privacy between both properties. It would be better to if the driveway could be positioned to avoid disrupting this existing landscaping.

…planting a combination of large Leland Cyprus along the front and side of the building would help it blend with existing landscaping…

We know from experience with the construction of the Dulles Access road behind our house that if it isn't done right in the beginning it will never be corrected. Please help us see that this is done right this time.

I would suggest …that you make the building blend into the fence area in such a way that it would not be apparent that there's even a building there…If you take and make it in a way that it looks like a building was actually built there for…as a part of the neighborhood, that's not going to be good.

Mr. Hadd had suggested that, perhaps, if you guys took a 10-foot out of the wall and moved the wall back 10-feet back toward the roadway and had an additional to10-feet out here and made the fence go around in that direction, it would also help to hide the structure.

The roof of that building is also, if you can make it low enough that it is not going to protrude any higher than a foot above the existing wall, that will also be a help in hiding that structure.

…I don't know what the time period is that it's going to take to build it, but that would be helpful for us to know in the neighborhood. (0003, 2-01)

> ***Response:*** *The Project Team has recommended Option A as the location of TBS-2. The recommended location of Option A on the residential side of Dulles Connector Road's wooden noise wall is appropriate. The location cannot be shifted towards the Road since the TBS-2 would encroach upon the required clear zone of approximately 30 feet beyond the edge of the travel lane.*
>
> *The Team recommends that that a new wooden noise wall surround the TBS-2 for its security, for enhanced community safety and for the aesthetics of the neighborhood. Since TBS-2 would not be visible from the Baldwin Drive neighborhood, it would not receive any architectural treatment. The new wooden noise wall would have doors at the location of the doors of the TBS-2 and the remote train control room. The height of the new wooden noise wall would be sufficient to screen the TBS-2, which has a height of 13 feet.*
>
> *The width of the access driveway will be determined during preliminary engineering and final design. Specific arrangements regarding landscaping will be addressed with affected property owners. Landscaping on the side of 1838 Baldwin Drive will not likely be part of the*

arrangements, in that all construction activity will likely take place on the property of 1836 Baldwin Drive.

DRPT, the project sponsor, anticipates the start of construction in late 2006; the exact timing for the construction of ancillary facilities, such as TBS-2, will be determined during preliminary engineering and final design. Typically, construction of these facilities is completed in one year or less. The Project Team will continue to coordinate with affected property owners on the design of this facility and construction scheduling.

Potential Neighborhood Impacts of Tie Breaker Station No. 2

Public Comment: We believe that Tie Breaker Station No. 2 (TBS-2) and related equipment poses a serious and significant health and safety threat to Tuckahoe's 3200 members, many of whom are children. Further, the station will impose substantial aesthetic injury on the Club.

…Thus, the placement of TBS-2 on Tuckahoe property would be a classic "attractive nuisance."

…Given these incidents, it is not unreasonable to expect that there would be breaches of the security fences for TBS-2. With a direct current of 750-volts in the building, any such security breach could cause tragic or fatal injury.

…These meets bring hundreds of children to Tuckahoe…Again there is no way to avoid hundreds of children in direct proximity of the Tie Breaker Station, the remote control room and the underground electrical grounding grid.

The consequences of a fire at TBS-2 would be severe for Tuckahoe and its members. If any chemical fire suppressants were used to control the fire, the possibility exists that those chemicals could be introduced into the pools causing injury and/or closure of the pools and the entire facility.

It is quite likely that the placement of TBS-2 on Tuckahoe property would make it even more difficult for the Club to obtain liability insurance. If we were not able to obtain insurance,…Tuckahoe would hold the project and its operators responsible for and seek damages for the loss of use of the entire Club facility.

Tuckahoe is simply not in a financial position to bear the continuous risk of injury or death from the presence of TBS-2 on Tuckahoe property.…The resulting loss of membership revenue could threaten the financial viability of Tuckahoe.

The removal of Tuckahoe's old growth trees in the portion of the Club's property would give the Club a blighted barren look…. (0150, 2-02)

Public Comment: So it is a very family oriented club and I raise that issue to emphasize the point that it is –there are children who are involved in the clubs activities all year around…

…when there are dive meets, there are other teams that invited to Tuckahoe and they're setting up their spots on the lawn, some of which are quite close to the tie breaker station …

…there's a term in the law that's called "attractive nuisance" and children will be children. I raise this probably to address mostly the safety concern…(0151, 2-01)

Public Comment: I want to directly address two major issues. One, to hit again, even harder, safety and liability, which is very much a concern of the Board of directors.

It is of very much concern to Tuckahoe who will bear liability for any injuries that might result from accidents from kids climbing these fences. Will WMATA indemnify TRC if TRC is sued in such cases? Will WMATA agree to protect TRC from related increases in our liability insurance premiums, which have

tripled in the last three years? Will WMATA guarantee TRC's ability to obtain liability insurance which has been very difficult to obtain in recent years despite a clean claims history?

We need to make sure that access to TBS-2 from Baldwin Drive does not provide easier unauthorized access inadvertently to TRC property, with the resulting potential of vandalism and liability.

It is acknowledged that the structure would require the elimination of the miniature golf course; this golf course is a unique benefit to our more than 3,200 members and this golf course distinguishes TRC from our competition in the area of local recreation clubs.…There is no other level space on the property to relocate the miniature golf course without removing parking spaces; moving parking spaces requires the club to reduce its membership, which then reduces our annual revenue.

…the TBS structure will be visible from most areas of the club, even with a barrier or trees. This will reduce the open space and aesthetic appeal of the facility, damaging the value of the property and of a club membership and diminishing the members' enjoyment of the facility. (0152, 2-01)

Public Comment: [The conference record received from the Club president and general counsel a petition titled 'Metrorail Tie Breaker Station No. 2 Petition' 'I am opposed to the placement of the a Metrorail Tie Breaker Station on Tuckahoe Property' and signed by numerous individuals. (0153, 2-01)

Public Comment: The enormous safety and aesthetic problems inherent in placement of TBS-2 on Tuckahoe property makes this site completely unsuitable for such use and could lead to potentially tragic consequences.

It takes little imagination to envision a variety of plausible scenarios in which children would be placed in grave danger by the placement of TBS-2 on Tuckahoe property. …The site is also at risk for vandalism, falling trees or braches, a leaky roof…

The placement of TBS-2 at Tuckahoe would severely damage the Club's aesthetics. (0154, 2-01)

Public Comment: We have improved the house; we have expanded, we have 20-year old garden and if you build the Tie Breaker Station at Tuckahoe, the wires are going to go under our yard; under a 20-year perennial garden; under a brick patio; under a fabulous huge trees.

…the traffic noise on the other side of the wall has increased so much that I can't talk to my husband on the deck…adding something as visually unattractive to our neighborhood is a double burden for us…

And I don't want to sit in front of trees trying to grow to cover an eyesore that will be a daily reminder that I don't have control over what happens to my house, something that I have worked very hard for; worked very hard around and have no options. (0155, 2-01)

> ***Response:*** *The Project Team has recommended Option A as the location of TBS-2, which is within the existing right-of-way of the Dulles Connector Road. Access would be provided via a driveway from the Baldwin Drive cul-de-sac across residential property.*

Public Comment: We think that a greater effort should be made at getting access through Olney Park to put TB#2 at location C on the land locked property. (0003, 2-02)

Public Comment: We strongly urge you to use Alternative C for the Tie Breaker Station. Alternative C is on undevelopable, inaccessible, and uninhabited private land and thus would impose no safety hazards upon local residents. The placement of the TBS-2 at location C makes far more logical sense than either Alternative A or B. (0150, 2-01)

> ***Response:*** *The Project Team has recommended Option A as the location of TBS-2. Many of the potential impacts raised above are addressed by this selection. As the project design advances,*

the proponent will continued to work with residents and communities to address potential impacts of siting facilities.

Public Comment: Page A2 of the Post-Hearing Conference Report states that Option A has been selected. As the property owner of 1836 Baldwin Drive, I would like to add the following comments:

Surrounding the Tie-Breaker Station #2 (TBS#2) with the same wooden sound wall material that is currently in place is appropriate and would "mask" the view of TBS#2 from the street. This also obviates any need to provide architectural treatment to the TBS.

The replacement of those portions of the sound wall that must be removed to construct TBS#2 should be much higher than one additional foot. This neighborhood will experience noise over and above that which will be experienced by other areas along the Dulles Corridor, since the switching tracks will be located in the median of the Access Road directly opposite my home and the homes of my neighbors. We will all experience greater noise, and replacing the sound wall with a sound wall that is a mere ten (10) feet taller would not materially alter the aesthetics of the sound wall from the perspective of those traversing the Access Road. However, the additional ten feet will make a significant difference in the quality of life for all those living near the switch tracks, particularly those living in the cul-de-sac at the end of Baldwin Drive. All of these neighbors have expressed a desire for a higher sound wall and I wish to inform Project officials of this desire by the residents of Baldwin Drive.

I concur with the recommendation to make the roadway to TBS#2 parallel to the centerline of the property line between 1836 Baldwin Drive and 1838 Baldwin Drive. I would only add that if the roadway is not adjacent to the property line, then the Project should obtain an easement for all land between the east end of the roadway and the property line.

The material used to construct the roadway should be consistent with the surrounding surfaces, i.e., grass rather than pavement. This can be accomplished by using the geo-grid or open concrete block with grass turn in the cells. This would also be consistent with existing drainage and other issues. I ask that the Project officials implement this as part of the TBS#2 project.

Finally, the landscaping that is removed should be replaced in kind. The existing wooden arbor that is located in what is likely to be the roadway to TBS#2 should be moved at the expense of the Project, and not at the expense of the homeowners. (0025, 2-02)

Response: *The Team Recommendations of June 2004 recommended a wooden noise wall that would be one foot taller than the Tie Breaker Station #2, which has a height of 13 feet. This recommended wall, which would screen TBS-2, would not be 10 feet taller than the existing wall. Any section of the existing wooden walls removed or relocated as a result of the Project would be constructed of like materials.*

On the above topics of easement, pavement materials and landscaping, the Team has no change to its June 2004 responses and recommendations.

Need to Consider Joint Development

Public Comment: …look at integrating the Kiss & Ride and the bus facility into some kind of joint development of all this property, including Fairfax County property. (0117, 2-02))

Response: *The Team remains open to any initiative of the County or private sector for joint development for the Tysons West Station site facilities.*

Benefits are Understated and Costs Overstated for Rail Alternative

Public Comment: Supports the Project Team's recommendation of Metrorail Alignment T6, but support is based on the belief that the Draft EIS analysis understates Metrorail's ridership potential, air quality

benefits, and other general benefits; and overstates Metrorail's costs relative to BRT. Commenter notes that the Draft EIS analysis does not appear to consider the higher densities recently included in county comprehensive plans in its traffic projections. (0133, 2-01)

> ***Response:*** *For the Draft EIS, Supplemental Draft EIS, and Final EIS, the Project's ridership forecasts were developed using the Northern Virginia Major Investment Study Model. This model was developed for the original Dulles Corridor Transportation Study (June 1997), a major investment study, and was also utilized for the Metrorail I-66 to Centreville Major Investment Study. This model set was utilized instead of the COG Version 2 model because Version 2 had not yet been validated. A more detailed description of the selection of the model is outlined in Chapter 3 of the Travel Demand Forecasting Methodology and Results Technical Report* (June 2002). *The NVMISM model is not a replacement of the Version 1 Model but rather an adaptation and refinement of the model for more localized analysis. This approach was used because the Version 1 model is region wide and is meant to describe regional travel flows. The NVMISM model refines this model in terms of a more detailed highway and transit network, smaller transit analysis zones that more closely reflect the differences in land use, and the incorporation of BRT into the model. In addition, Version 1, because it is a regional model, does not estimate mode of arrival accurately at a station area level, thus making it difficult to plan for parking capacity and other station area improvements. Chapter 22 of the* Traffic Analysis and Station Access Study Technical Report (June 2002) *provides a detailed discussion of the development-related travel effects on the corridor's roadways. The analysis is also summarized in Section 9.3.4 of the Draft EIS. The air quality analysis was performed in accordance with NEPA requirements to evaluate and disclose the impacts of this project. The air quality analysis followed the guidance of EPA, DEQ, VDOT, and MWCOG.*

Arguments Against Alignment T12 are Irrelevant

Public Comment: Believes that most of the arguments against the proposal of an express track (Alignment T12) are irrelevant because the arguments were based on assumptions not offered by WATF including that the express track would be built and operated before Tyson's T-6/T-9 alignments and that an additional station would be included on the express track. WATF's proposal specified no stations on the express track and that the express track would come after the implementation of T6 or T9. The WATF will withhold further discussion concerning Alignment T-12 during the EIS phase of the project because they agree with the response in the *Public Hearings Report* stating that further evaluation of the extra space required for Alignment T-12 would delay the present EIS process. (0133, 2-02)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignment T12 was eliminated from consideration during the public and interagency review and comment on the Draft EIS.*

Consider Transit and Highway Options for Dulles Corridor

Public Comment: Believes that the Dulles Corridor is increasingly becoming the 21st century's "Main Street" to the National Capital region because it links the federal center with the city's international gateway. However, the corridor will only achieve its full potential for the region's prosperity if transportation offers effective transit as well as effective highway options to the user. Commenter stresses the importance of cost control and the flexibility to embrace future options. (0133, 2-03)

> ***Response:*** *Comment noted; however, the study of alternative highway options is outside the scope of this project.*

Costs Need to be Contained

Public Comment: Believes that compared with BRT, Metrorail offers the region much greater potential to stimulate denser land uses around stations in the Dulles corridor and in Tysons Corner. Also states that

the obvious proviso to this Metrorail advantage is the need to ensure that the 24-mile Metrorail extension is not allowed to follow past Metrorail practice with respect to cost escalation and subsidy. (0133, 2-04)

> ***Response****: The financial analysis presented in the Final EIS are the summary results of the capital cost estimate, operation and maintenance cost estimate, projected revenue estimate and operating subsidy allocation. NEPA requires the environmental impact statements to succinctly describe the data and analyses used to understand the effects of the alternatives. Obviously, with any large complex project, schedule and cost risks are real. WMATA has proven itself in project delivery. For completion of its 103-mile program, opening between 1997 and 2002, WMATA was under budget by $286 million, and on-time or early by 10 months aggregate. Moreover, DRPT is primarily accountable for the cost-effective delivery of this Project as its owner and contracting authority. DRPT has entered into a PPTA contract with Dulles Transit Partners for the benefits of PPTA, which are explained at DRPT's web site, www.drpt.virginia.gov. Through the Federal Full Funding Grant Agreement, FTA will not participate in the funding of any cost overruns.*

Station Design Should Facilitate Air Rights

Public Comment: Believes that the long-term evolution of air rights above stations, as market demand warrants, will significantly increase ridership and reduce long-term subsidy burden on taxpayers. Therefore, station design should allow for the evolution of air rights. (0133, 2-06)

> ***Response:*** *With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*
>
> *Pedestrian walkways are provided from stations in the median of the highways to both roadsides.*

Public Comment: Pleased with and largely accept findings and recommendations. Study is far superior and requires only a few modifications. (0013, 2-01)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

Prefers Metrorail Over Roadway Widening

Public Comment: Agrees that Metrorail in the Dulles Corridor is a better capacity enhancement than roadway widening. (0013, 2-02)

> ***Response:*** *he Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The Metrorail Extension will provide the greatest amount of person-throughput capacity in the corridor.*

Metrorail Performance is Superior to BRT

Public Comment: Cites FTA and APTA reports that indicate rail carries people for less money per mile than bus. In the Dulles Corridor, both Metrorail and BRT should do better than average, as indicated in the Draft EIS for BRT but not for Metrorail. Commenter says not to count on BRT doing as well as predicted, but Metrorail should do better than predicted, based upon experiences almost everywhere. (0013, 2-03)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT,*

BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.

Cites Metrorail's Economic Value

Public Comment: The economic value of Metrorail is better because it results in lower tax rates. (0013, 2-04)

Response: *As described in Chapter 5 of the Final EIS, the Metrorail Extension will have a positive effect on the local economy as a result of construction expenditures. These effects include impacts on employment, output and earnings as funds are spent and re-spent throughout the economy. These are one type of economic impact, and do not necessarily the full cumulative effects of the project on the regional economy.*

The Project Team applied multipliers from the US Department of Commerce, Bureau of Economic Analysis' Regional Input-Output Modeling System (RIMS II). These multipliers, which reflect the industrial base of the region, are multiplied by the direct capital expenditures in order to calculate the total effects on the regional and state economy. The multipliers used reflect the economic base of Fairfax and Loudoun Counties combined, and it is not possible to break out the total effects by County.

Supports Alignment T6 and Yard Site 15

Public Comment: Strongly supports the selection of Metrorail Alignment T6 and Yard Site 15 as the Locally Preferred Alternative.(0141, 2-04)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner and Yard Site Y15 on Dulles Airport property as the Locally Preferred Alternative.*

Design team Needs to Focus on Issues not in DEIS

Public Comment: Agrees with the selection of Alignment T6 as the Locally Preferred Alternative. The design team now needs to focus on issues that were not discussed in the Draft EIS or *Public Hearings Report*. (0387, 2-06)

Response: *Comment noted.*

Need to Identify Opening Year

Public Comment: Commenter does not see an opening year (date) for the implementation of the Locally Preferred Alternative. Each year that goes by without this project means another year of increasing congestion. (0123, 2-01)

Response: *For the analysis in support of the Final EIS, the Wiehle Avenue Extension is expected to be complete by 2011. The Extension to Dulles Airport/Route 772 would complete construction of the LPA, extending the line from Wiehle Avenue, through Dulles Airport, to Route 772 in Loudoun County. This phase would include the construction of the new Service and Inspection (S&I) Yard on Dulles Airport property. It is anticipated that this second extension would be complete by 2015.*

The implementation schedule will be refined and updated during preliminary engineering. There are several factors that will affect the schedule, the most significant being the availability of federal and non-federal funding. There are many systems across the country competing for federal funding, and the Federal Transit Administration may not be able to commit funding in the amount needed to meet this schedule.

Concerns with the Underground Section Between Routes 7 and 123

Public Comment: Concerned with the impacts and costs associated with the cut and cover and mined tunnel of the underground section between Routes 7 and 123. This issue deserves a full vetting before various affected parties as well as local officials. (0387, 2-07)

> ***Response:*** *Value planning and engineering exercises will be performed during preliminary engineering and will examine alternative methods of underground construction, including an identification of costs, impacts, and feasibility of construction.*

Need More Work on Surface Facilities of Project

Public Comment: Significant work needs to be done in the access to and design and location of surface facilities, especially in Tysons Corner. Need to consider employer shuttles in design and improvement to pedestrian access of Tysons area. However, an effective pedestrian environment would reduce the requirement for shuttles and vehicular facilities at the stations. (0387, 2-08)

> ***Response***: *Station design will be part of continuing coordination with Fairfax and Loudoun counties. The counties govern development adjacent to stations through zoning and comprehensive planning procedures.*

Extend Metrorail to an Intermodal Terminal in Tysons Corner

Public Comment: Commentor wants to know if any study was done of a Metrorail spur from West Falls Church to a terminus at Tysons Corner, with a major park-and-ride and intermodal center. States that it intuitively makes more sense than Metrorail out into auto-dependent country beyond Tysons Corner. (0508, 2-01)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The effects of extending Metrorail from the Orange Line to an intermodal terminal at Tysons West were evaluated in detail in the Draft EIS as part of the BRT/Metrorail Alternative.*

Public Comment: I did not see this [a terminus at Spring Hill Road] addressed adequately in the SDEIS. I am curious if there would be any cost savings or other benefits of putting the rail terminus in Tysons Corner at Spring Hill Road, vs. Old Courthouse Road.(0112, 2-04).

> ***Response:*** *The purpose of the Supplemental Draft EIS was to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS public hearings report. A number of alternatives, including various Tysons Corner alignments, were evaluated in detail in the Draft EIS and Section 4(f) Evaluation* (June 2002)*. Additional information on the alternatives considered, and the screening process used to evaluate the alternatives is included in the Final Alternatives Analysis Report (May 2001).*

Issues Relating Rail Yards and Communities

Public Comment: At the West Falls Church station with the improvements in the rail yard, you had the opportunity now to allow access from the north. And we think that could have done from around the edges of the rail yard and also be made secure so there would be no access from the rail yard. This would be a tremendous improvement of access to that station from all the residential areas to the north of the rail yard that people in the houses can see the station but have to walk a long way to get there. (0117 0146-3)

> ***Response:*** *Pedestrian improvements at the West Falls Church Station would not be completed under this Project. WMATA and Fairfax County may consider this under other programs.*

Public Comment: Another problem of particular concern to us is, is the one that exists at the West Falls Church S&I yard because phase one will not reach Dulles, will not have the benefit of the projected yard in the Dulles area, so therefore much greater demands are being made upon the West Falls Church yard.(0034 0143-4)

> ***Response:*** *The Wiehle Avenue Extension improvements at the West Falls Church S&I Yard include the addition of storage tracks and modifications to the existing Service and Inspection Building. As part of the mitigation, a covered box on the loop track and the new yard lead track would be built to help minimize sound from rail vehicles proceeding through the yard. These track and service building improvements are necessary for operation of the Wiehle Avenue Extension, but would be occurring at some time in the future to support WMATA operations even without implementation of the Project.*

Consider Phased BRT and Metrorail

Public Comment: Seriously consider the feasibility and benefits of BRT as an alternative to heavy rail. WRN believes that a more plausible and financially feasible scenario for the Dulles Corridor project is the one suggested by Federal Transit Administration Administrator Jennifer Dorn in a meeting with local officials a year ago: as a first phase, consider building rail to Tysons Corner and implementing a BRT system for the remainder of the corridor. A second phase could include extension of rail through the entire corridor if ridership and land uses can justify the investment. (0090 0105-2)

Public Comment: I would request the project team not advance this to preliminary engineering and instead terminate the rail line at Spring Hill Road and study a true BRT system all the way up to Leesburg that will include stations and other rider amenities that Metro only provides now for its rail customers. (0016 0122-11)

Public Comment: Why not just establish a tax district that includes Tysons, build the first phase to Tysons, come along with the second phase in the future when there is funding for it, and, in the meantime, establish a very enhanced BRT system in the Dulles Corridor. (0076 0087-1)

> ***Response:*** *The purpose of the Supplemental Draft EIS is to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS public hearing report. A Bus Rapid Transit (BRT) alternative was evaluated in detail in the Dulles Corridor Rapid Transit Project Draft Environmental Impact Statement and Section 4(f) Evaluation (June 2002). Based on the analysis contained in the Draft EIS, public hearings held in July 2002, and comments received on the Draft EIS, the Metrorail Alternative (T6/Y15) was selected as the preferred alternative for the project by the Commonwealth Transportation Board (CTB) and by the WMATA Board of Directors in late 2002. See responses to comments in Section 2.2 above for additional details.*

Reconsider the Tysons Corner Stations & Tunnel

Comment Objective VHT data and other user data does not justify placement of four metro stations in the Tysons Corner area, nor is the need to dig a tunnel in the Tysons Corner area – with its massive dislocation during that protracted effort – analyzed or justified. (0068 0173-8)

> ***Response:*** *The placement of four stations in Tysons Corner is based on the significant ridership demand that the core of Tysons Corner provides and the compatibility with local land-use plans that promote transit oriented development in the area. The one-mile section of underground alignment in Tysons Corner was designed to minimize impacts to the adjacent areas, and the use of a mined-tunneling construction method instead of a cut-and-cover method would further minimize impacts to the surface roadways.*

Need to Identify Bicycle and Pedestrian Improvements

Public Comment: Since this is - - this project is taking place in Virginia, the first phase of the project is being funded by Virginians, and I think we should not be held to the WMATA Compact restrictions that restricted off-site pedestrian and bicycle improvements. (0065 0073-3)

Public Comment: Non-motorized access to Metro stations remains a very high priority for not only my constituents but also for me, and I hope you will keep that in mind as you move forward with this project. (0059 0061-1)

Public Comment: Both Loudoun and Fairfax County planning officials and elected representatives must work with Virginia Department of Rail and Public Transportation, WMATA and VDOT to assure that pedestrian access is an integral part of the development around these transit stations. (0067 0075-2)

Public Comment: Effective pedestrian and bicycle access to transit stations is essential. Both Loudoun and Fairfax County planning officials and elected representatives must take responsibility in assuring that there is close coordination with VDRPT, WMATA, and VDOT to assure that pedestrian access is not an afterthought in the development of land uses in the primary transit impact areas. A detailed comprehensive access plan for each transit station is essential. (0041 0042-7)

Public Comment: We need to design station areas that encourage a lot more bike and pedestrian access. Reston has a good system of bike trails, most of which are grade-separated from congested roadways, and a great number of bikers and walkers. Particular attention should be given to pedestrian and bike station access in Reston. (0060 0169-12)

Public Comment: We would like to conclude with a general point. Walkable design of the new stations will ensure maximize mobility and accessibility benefits for all patrons. We strongly endorse the proposals of the McLean Citizens Association for trails, crosswalks, sidewalks and design changes to improve pedestrian and bicycle access to the new stations. (0026 0027-19)

Public Comment: I think that this stage of the preliminary engineering is the time for more detailed pedestrian and bicycle plans as they relate to access to the stations, specifically, access through the planned parking areas and to the station and also off-site access to the stations. (0065 0073-2)

Public Comment: There are other things that are needed, specifically, where the bicycle parking facility is going to be located and what type of facilities will be located there. (0065 0073-4)

Public Comment: Will pedestrian access be provided west of Tysons West station? Currently to walk west on Rt 7 means walking in the road or in ditches. As Jim Scott said, non motorized access is very important. (0029 0030-2)

Public Comment: Be it further resolved that, among other matters, careful consideration be given to improving pedestrian and bicycle access to the proposed Metrorail stations in the Tysons area and that all the issues detailed by the MCA in Attachment A hereto be carefully addressed and resolved in a way that promotes increased public access; (0034 0035-1)

Public Comment: I also want to say I believe that if you're really going to make this work, you have to make Tysons Corner more pedestrian friendly. That's important. That means building more exits, more roads, giving people a chance to cross roads so they can walk three or four blocks to the metro station before they come in. (0119 0149-2)

Public Comment: Also, in the report in - - on page 6-24 Section 6.3.2, bicycle and pedestrian facilities, it's stated that the implementation of design changes to the proposed LPA would have no additional effects on the existing and planned bicycle and pedestrian facilities in the Dulles Corridor. I believe this is incorrect because there will be, as stated on page 6-16, increased traffic on local roadways around the

stations, and the level of service at the Wiehle Avenue station will be decreased. This is going to have an impact on pedestrians and cyclists who are trying to access these stations. (0065 0073-5)

Public Comment: Parking at the Wiehle station is an issue that the County needs to take the lead in and develop the concept designs and prepare design guidelines that accommodate pedestrian and bicycle access and TOD. (0060 0169-7)

Public Comment: We think that, by designing much better pedestrian and bicycle access to the station and increasing our feeder-bus service, we can certainly reduce the congestion impacts on Wiehle as a temporary end of the line. (0060 0063-6)

Public Comment: It is stated in several places (specifically p. 110, Response: at bottom of page; p. 111, Response: in second box from top) that the responsibility for developing "Roadways, pedestrian and bicycle facilities outside the station area" rest with local jurisdictions.

However, on p. 113, Response to comment 0109-1 states that "All measures proposed to mitigate anticipated effects of the Project will also be implemented as part of the Project, except where specifically stated otherwise in the document." This is a very important distinction. Because traffic at the Wiehle Avenue station will be greater during Phase I, there will be negative impacts on pedestrian and bicycle access to the station. This negative impact needs to be mitigated. According to the statement on p. 113, this mitigation can be accomplished as part of the Project.

Many individuals have commented on the need for better pedestrian and bicycle access to all of the new stations. These needs should not be left entirely with the local jurisdictions. They should be an integral part of the design of the stations, similar to how motorized access to the stations is addressed. I was encouraged to read on p. 155, in the response to the need for pedestrian access, that "Station access issues will continue to be explored in preliminary engineering".(0065, 2-01)

> ***Response:*** *DRPT is the Project's sponsor and initial owner but is not responsible for modifications of sidewalks and trails as part of station access. The responsibility is with Fairfax County, Loudoun County and VDOT. DRPT will, though, coordinate with these three parties plus the Town of Herndon during preliminary engineering and final design on improvements for station access beyond the station site plans, as well as their ownership and maintenance. Close communication would also occur with the Fairfax County Non-Motorized Transportation Committee, private landowners and developers and other stakeholders. The Fairfax Countywide Trails Plan and the Loudoun County Trails plan have been and will be consulted. Comprehensive pedestrian circulation beyond the station site plans may be implemented in conjunction with other planned developments, County, and/or State projects and/or as elements of the Fairfax Countywide Trails Plan and the Loudoun County Trails plan.*
>
> *All stations will have bicycle racks and/or lockers adjacent to station entrances. Specific quantities will be determined as part of final design.*
>
> *With respect to the Wiehle Avenue Station, the LPA and the Wiehle Avenue Extension are not expected to affect any existing or planned facilities in the station area.*
>
> *The references to mitigation of traffic effects in the Final EIS are for roadway improvements. The Project will bear the cost of those roadway mitigation measures.*

Public Comment: The opportunity to relocate the pedestrian connection as flipped provides increased coverage for residential and businesses in the western portion of Tysons Corner Center. (0053 0139-6)

> ***Response:*** *The Metrorail stations for the Wiehle Avenue Extension were designed and located based on proximity to residential, employment centers, entertainment centers and access. Further refinement to station design and orientation will occur during the preliminary engineering phase of the project.*

Public Comment: One aerial crossing from the Tysons East platform to the Kiss and Ride is insufficient. An elevated pedestrian crossing should occur across all four branches of the intersection at Rt. 123/Colshire Drive/Scotts Crossing Road. (0113 0132-14)

Public Comment: One aerial crossing from the Tysons East platform to the Kiss and Ride is insufficient. An elevated pedestrian crossing should occur across all four branches of the intersection at Rt. 123/Colshire Drive/Scotts Crossing Road. (0123 0158-16)

Public Comment: Sheets 086. Site Plan Tysons East Station 1. North Entrance Pavilion should be shifted to the north by spanning Scotts Crossing Road and building a stair, escalator with aerial walkway and ADA elevator tower to mezzanine level. (0113 0132-19)

Public Comment: Aerial walkways should be constructed across Colshire Drive, a second aerial walkway across Rt. 123 north of Colshire and Scotts Run Drive and north across Scotts Run Drive. (0113 0132-20)

Public Comment: Aerial walkways should be constructed across Colshire Drive, a second aerial walkway across Rt. 123 north of Colshire and Scotts Run Drive and north across Scotts Run Drive. (0123 0158-23)

Public Comment: There are no pedestrian connections to Pimmit Hills, the Commons, the Regency/Encore, the Colonies, or the Lincoln condos. This should be studied in the final plans. (0123 0158-27)

Public Comment: There are no pedestrian connections to Pimmit Hills, the Commons, the Regency/Encore, the Colonies, or the Lincoln condos. This should be studied in the final plans. (0113 0132-22)

Public Comment: The platform for the Tysons East Station should extend northeast approximately 150 feet and cross Scotts Crossing Road allowing elevator/stair tower access at the southwest corner of the Cleveland Site. (0123 0158-15)

> ***Response:*** *The Metrorail stations for the Wiehle Avenue Extension were designed and located based on proximity to residential, employment centers, entertainment centers and access. Further refinement to station design and orientation will occur during the preliminary engineering phase of the project. Coordination between DRPT, WMATA and adjacent property owners will continue throughout preliminary engineering and final design.*

Public Comment: At the West Falls Church station since there are going to be major changes to that station, this is a good time to add additional pedestrian and bicycle access points to that station. (0065 0073-6)

> ***Response:*** *The Wiehle Avenue Extension will include improvements to the West Falls Church Yard and will include the diversion of many of the feeder buses from the West Falls Church Station northside facilities to Wiehle Avenue Station. That diversion will decrease the patronage at West Falls Church Station. Thus, there are no major changes necessary at this station.*

Public Comment: The overhead pedestrian crossing from the station to the points east of Route 7 has an L shape with increased travel distances. (0053 0139-3)

Public Comment: We believe the pedestrian orientation may be better served with alternatives that relocate the mezzanine from the south-- from the north end of the station to the south end in the vicinity of Spring Hill Road. (0053 0139-5)

Response: *For the Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7. The referenced L-shape pedestrian bridge across Tyco Road and Route 7 has been eliminated.*

Parking Issues in Tysons Corner

Public Comment: Reducing Tysons West parking facility to 500 spaces "to lessen traffic impact" is a farce. What about the 2500-space parking garage in a residential neighborhood less than a mile west of Tysons West? I guess politically it is okay to give McLean Bible Church whatever they want but not okay to provide tax paying citizens with a means for using public transportation. And the church will dump all 2500 cars on the road at the same time several times on Sunday and on many other occasions during the week. (0029 0030-1)

Response: *The Project cannot address the issue of parking at the McLean Bible Church. However, the difficulty of mitigating the traffic impacts of 2,000 spaces led to the decision to reduce the amount of parking proposed at the Tysons West Station.*

Public Comment: The impact on the established residential neighborhoods in the vicinity of the Route 7 line and its two stations would be huge. For one thing, providing auto parking spaces for each station would be a sizable undertaking. (0102 0119-3)

Response: *No parking is planned at the Tysons Central 7 Station. The parking at Tysons West has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts.*

Public Comment: If indeed the purpose of the Tysons Loop is to get people to work, why do we need parking? It seems to us that a parking lot will only encourage more congestion in the Tyco Road Route 7 areas. We object to anymore congestion associated with this area since it is plenty congested enough. We can see very little purpose served by a 500 car parking facility located at Tysons West Station. (0004 0004-4)

Response*: The parking at Tysons West would be for people who live in Tysons Corner or east of Wiehle Avenue and desire access to Metrorail without traveling to West Falls Church. The parking at Tysons West has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts.*

Public Comment: I am writing particularly about the improvements contemplated in the Tysons Corner alignment and in particular the Tysons West Station. By this letter, please be advised that the 79 business owners at Tyco Park Condominium Association do hereby strenuously object to construction [of] parking facilities [in] Tysons Corner. Furthermore, we strenuously object to elevated rail commencing at Tyco Road preceding towards the Dulles Toll Road. We could support an underground station between Springhill Road and Tyco/ of Westwood Center Drive extending out to the Dulles Toll Road. (0004 0004-1)

Public Comment: As proposed, the Tysons West Station is intended to be an aerial station. We strongly object to the disruption to the businesses located in the vicinity associated with this activity. Subterranean chaise is vastly superior. (0004 0004-2)

Public Comment: I read recently that the proposed garage at the planned Tysons West station at Tyco Road near Route 7 will be reduced in size from a garage that would house 2,000 cars to one that would house just 500 cars. I must object to that reduction. I currently live about a mile from the proposed Tysons West station and would use that station when built, and plan to park in that garage, for my commute to my

office downtown. I currently have a reserved space at the West Falls Church station (although I will be displaced during the period of the garage construction).

As you must be aware, parking at West Falls Church without a reserved parking space is extremely tight. It takes months if not years to get a reserved parking space because the Metro system has become quite popular and is very busy and crowded. It is quite likely that the planned parking garage at West Falls Church will be fully booked when it opens, also. There is a huge need for more parking capacity at the Metro stops since many people in the suburban subdivisions drive to the Metro, park, and take the train to their jobs. Reducing the size of the parking garage at Tysons West will not benefit either the Metro passengers nor those living in proximity to the Tysons West station. The garage will be too small to handle the demand, and Metro will be forced to build an additional garage eventually. Traffic will be worse around that area as "kiss and ride" Metro passengers will be dropped off by drivers who will have to return for the pick-ups. It is possible for a larger scale garage to be designed as (0009 0009-1)

> ***Response*:** *For the Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans.Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.*
>
> *The parking at Tysons West has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts. The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known. The park-and-ride would be accessed from local roads, and its cost is assumed as part of Wiehle Avenue Extension.*

Public Comment: Based on our experience in land use applications in Northern Virginia and preparing traffic impact studies, we concluded that the proposed configuration had limitations:
1. Pedestrian conductivity to businesses and existing residences. We question if Tyco Road is the best corridor for pedestrian connections for transfer facilities
2. One access to Tyco Road in close proximity to the Route 7 traffic signal, which experiences excess delay during the peak periods.
4. The overhead pedestrian crossing has a L shape to crossover 7 and Tyco Road, increasing walk distances (0053 0054-1)

Public Comment: The attached Exhibit 1 highlights the 1/4 mile walk radii changes if the pedestrian connections were flipped. We suggest this be studied and relocation of the Route 7 pedestrian overpass should be considered as part of the bus transfer facility studies in order to promote improved pedestrian access to the residents and businesses in the western portions of Tysons Corner. Based on our initial review and as generally confirmed by WMATA and CTC staff, this would not affect train operations at the proposed station, if one entrance were maintained. (0053 0054-4)

Public Comment: PHR + A suggest that the team consider the following criteria in the Tysons West support facility locations:
- Consistency with Fairfax County Board of Supervisors Comprehensive Plan,
- Minimize land impacts to Route 7 frontage,
- Maximize pedestrian flexibility,
- Promote access circulation flexibility
- Allow for efficient bus transfers from the Rail Station,
- Recognize redevelopment potential
- Consider Acquisition costs (0053 0054-5)

Public Comment: Finally, alternative locations south of Tyco Road may be considered which still maintain Route 7 commercial frontage, but locate the bus and kiss and ride facilities towards the rear of the County's Overlay District. As shown in Exhibit 5, the alternative allows more than 1 driveway to Tyco,

for buses to turn left out of the facility. A portion of alternative may utilize the existing C-7 property used by the existing Buick Lot, but is at the rear of the site. (0053 0054-9)

> ***Response:*** *For the Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans.Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7. The access point for the station facilities is at Tyco Road with adequate distance from the Route 7 intersection.*

Public Comment: p. The SDEIS is flawed in its contemplation of no Kiss & Ride or Park-and-ride facilities at two of the four Tysons Corner Area Stations (i.e., apart from the fact that four stations are outrageous, costly surplusage for Tysons Corner area) (at 2-21). The notion that these stations can accommodate suburban users with buses and pedestrian facilities without the use of vehicular parking is nothing short of ludicrous. (0068 0173-33)

Public Comment: q. Parking capacity at the Tysons stations, if any end up being built, needs to be drastically increased. Any effort to push all parked cars out to Wiehle Avenue is being driven by special interests, not user data. For example, elimination of a 2000-space park-and-ride structure from the T6/Y15 vision, with reduction to 500 spaces, would be a disaster resulting in gridlock and massive frustration. (0068 0173-34)

> ***Response:*** *The park-and-ride capacity at Tysons West Station was reduced due to traffic concerns. Park-and-ride facilities at the three other Tysons Corner stations were not pursued because these stations are being designed as urban stations oriented to pedestrian access to reflect the county's plans to transform Tysons Corner into a more densely developed pedestrian-oriented urban center.*

Parking Issues at Wiehle Avenue

Public Comment: Wiehle Avenue structured parking should be built close to station, while the lot further away to the north reserved for future development (0064 0152-3)

Public Comment: The Wiehle Avenue parking should be close to the station. There are two sites: one of them is the surface park right now. That should be reserved if any site is reserved for future development. Any parking structure should be right near the train station making it convenient for the people who are due in there. (0064 0072-3)

> ***Response:*** *In accord with the final Team recommendations for Wiehle Avenue Station, the final General Plans include a site plan that accommodates future joint development at the station. The site of the joint development would on the current Reston East park-and-ride facility along Wiehle Avenue.*
>
> *Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which will advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.*

Public Comment: There is insufficient parking proposed at the interim rail terminus (Wiehle Avenue) for the amount of ridership projected. The project team is only providing 2,300 parking spaces, yet projects (in opening year, 2009) 7,432 boardings at the Wiehle Station. This means you are only providing parking for 31% of total station activity. Parkers constitute 42% of Orange Line users (at least according to your 2000 Base statistics. The project team is making overly optimistic assumptions of how many people will arrive at the rail stations by bus, dropoff or on foot versus car. (0016 0122-19)

Public Comment: [R]idership to Wiehle does not match parking demand. (0016 0122-7)

Public Comment: [Y]ou are only providing 2,300 spaces at two stations. This is appallingly low. I don't see how you can estimate 25,000 opening year riders at the new Wiehle line without providing sufficient parking? (0016 0122-8)

Public Comment: The other problem I noted in the SDEIS is insufficient parking and again, overly inflated ridership data. (0016 0122-5)

> ***Response:*** *The demand forecasts reported in the Supplemental Draft and Final EIS take into account the park-and-ride capacity at each station. Ridership arriving at each station by automobile is constrained, if necessary, by park-and-ride capacity limitations. Higher arrivals via modes other than auto reflect these constraints. Further, bus service plans have been developed to reflect these constraints, providing high frequency connections to Wiehle Avenue from Herndon-Monroe, which would act as a satellite facility to the parking facilities at Wiehle Avenue.*

Public Comment: Impacts of the limited parking availability on Wiehle Ave not addressed. I live near the Dunn Loring Metro Station. Our communities feel the impacts of inadequate parking with Metro riders parking in the neighborhoods. A full discussion in the DEIS needs to address the impacts insufficient parking measures create on neighborhoods. (0110 0129-4)

> ***Response:*** *DRPT will continue to coordinate with City of Falls Church, Fairfax County, Loudoun County and the Town of Herndon to develop parking management strategies for areas near proposed stations.*

Public Comment: We further urge that the above recommended Fairfax County comprehensive planning study proceed with due diligence, in close coordination with the Preliminary Engineering work for the project, so that construction of a new air rights parking garage above the Wiehle Avenue station can be completed by the time rail service to Wiehle is initiated. (0040 0041-9)

Public Comment: While the number of spaces [at Wiehle Avenue] hasn't increased over the original DRAFT EIS, their 2,300 units, certainly the designs proposed are lackluster. They are not what we quite had in mind when we designated the Wiehle Avenue Station as a potential joint-development site. (0060 0063-4)

Public Comment: Fairfax County should explore using air rights over the Dulles Toll Road to provide parking, development immediately adjacent to the stations, as well as county facilities and a diversity of housing types. This “found” land could be used to address a number of county and project objectives. Engineering for the project should allow for future air rights projects. (0060 0169-9)

> ***Response:*** *With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*
>
> *Pedestrian walkways are provided from stations in the median of the highways to both roadsides. As designed, the proposed stations, guideways and other facilities do not preclude future air rights development by others; however, at this time no specific provisions are planned to accommodate such development. Technical issues of specific accommodations could best be addressed if specific air-rights project(s) were proposed during the current preliminary engineering.*

Public Comment: [Reston Association] supports the Fairfax County position urging that the existing parking at Wiehle Avenue not be expanded until there is a Full Funding Grant Agreement (FFGA) for extension of the rail system beyond Wiehle Avenue. (0039 0040-5)

Public Comment: [Reston Citizen's Association] supports the Fairfax County position urging that the existing parking at Wiehle Avenue not be expanded until there is a Full Funding Grant Agreement (FFGA) for extension of the rail system beyond Wiehle Avenue. (0040 0041-8)

> ***Response:*** *As stated In the final Team recommendations, for the Project Team, which has an overview of the Corridor's travel demand and of project justification by Federal criteria, there is a very important need to have adequate facilities at the end-of-line station at the start of Metrorail operations. The Project's goal of improved mobility must be supported by complete access to the station. With respect to the Federal criteria, FTA is placing increased emphasis on the cost-effectiveness of projects proposed for funding; the cost-effectiveness measure relies on the transportation benefits of the Project. Not to have the transportation benefits that the recommended park-and-ride facility offers would lower the FTA's rating of the Project and thus affect its prospect for funding. In addition, the Project's operating funding plan relies on the forecast ridership and revenue; reduced access translates into higher public subsidy. In order to be responsive to the above comments, the Project Team formulated an approach that achieves a balance of land-use objectives and mobility improvements. For the Wiehle Avenue station, It recommended that Fairfax County, with DRPT and WMATA assistance, solicit joint development proposals that would incorporate both the Project's station facilities and the community's desire for transit-oriented mixed-use development at this site.*

Public Comment: The SDEIS needs to clarify the meaning and impact of a parking structure at Wiehle Avenue Station that "would no longer rely on joint development for implementation, as the parking is required to accommodate project ridership in 2009 as an interim 'end-of-line' station." (SDEIS, 2-10). (0068 0173-10)

> ***Response:*** *In the Draft EIS and the proposed General Plans (June 2002), the Project Team had postponed preparation of a site plan of station facilities for Wiehle Avenue Station, in the belief that joint development of the Reston East park-and-ride site would incorporate the facilities. Commencing with the Supplemental Draft EIS and the revised General Plans (October 2003), the Team has presented site plans, given the understanding that the Wiehle Avenue Extension cannot await the outcome of a joint development solicitation. The current site plan of the final General Plans does accommodate future joint development along Wiehle Avenue itself.*

Parking Issues at Herndon

Public Comment: The Herndon Park & Ride, I understand now is at 70 percent of capacity. It will exceed capacity at 2009 when the subway elevated Metro is built out to that point. We cannot wait to 2015 to build additional parking at that site. (0064 0072-2)

Public Comment: Herndon Park and Ride will exceed capacity before phase II in 2015. Phase I planning for 2009 should include increased capacity (0064 0152-2)

Public Comment: [Reston Citizen's Association] supports incentive for people to change their mode of access to the [Wiehle Avenue] station such as expansion of the Herndon-Monroe parking garage as soon as possible. (0040 0078-1)

> ***Response:*** *The proposed opening year for The Wiehle Avenue Extension is 2011. The Wiehle Avenue Extension would terminate at Wiehle Avenue and therefore would not include Metrorail service to Herndon-Monroe. Providing additional parking capacity at Herndon-Monroe would be the responsibility of Fairfax County. The ridership estimates shown in the Final EIS already reflect available capacity and are constrained by that capacity.*

Parking Issues at Other Locations

Public Comment: I am particularly concerned by the language in the Loudoun County Comprehensive Plan that specifically prohibits transit-related parking at the Route 772 station even though this station is the terminal station in Loudoun County. While I agree that commercial, residential and public uses should be emphasized at this station, I believe that the total prohibition of transit-related structured parking will prove detrimental to reasonable access to the transit system, and result in serious "bootleg" parking violations in the neighborhoods surrounding the station. (0041 0042-12)

Public Comment: We are particularly concerned about the language in the Loudoun County Comprehensive Plan that prohibits trans-related parking at the Route 772 Station. We feel that this is something that needs to be changed and addressed. (0067 0075-8)

Public Comment: We urge that the counties work with Virginia Department of Rail and Public Transportation, WMATA, to assure structured parking opportunities at all transit stations. This is particularly important for the Reston Town Center Station and Route 772 Station in Loudoun County. (0067 0075-7)

> ***Response:*** *Commencing with the evaluation in the Supplemental Draft EIS, extensive park-and-ride facilities and Kiss & Ride areas, as well as major off street bus facilities, were added to the Full LPA in response to Loudoun County's recognition that this end-of-line station was far too significant to preclude such essential access facilities. Planned developments on either side of the Greenway have likewise recognized the benefits of these improvements and would provide proffers to accommodate them. A total of 3,300 park-and-ride spaces are now part of the approved site plan for Route 772 Station.*
>
> *Consistent with the Fairfax County Comprehensive Plan, there are no provisions for parking at the Reston Parkway Station as originally documented in the Draft EIS.*

Public Comment: The SDEIS fails to describe or provide for commuter parking lots other than at future stations. (e.g., at 2-17). This ignores current use patterns (e.g., use of the Herndon-Monroe and Reston East stations for commuters using buses to reach West Falls Church metro. (0068 0173-12)

> ***Response:*** *Chapter 2 of the Final EIS describes the project's intentions for the existing Herndon-Monroe and Reston East park-and-ride lots. Under the Wiehle Avenue Extension, Herndon-Monroe would be a satellite facility to the Wiehle Avenue Station, with high frequency bus service between Herndon- Monroe and Wiehle Avenue to facilitate this role. In the Full LPA, the Herndon-Monroe Park-and-Ride would be expanded to support the Herndon-Monroe Metrorail station to be located in the median of the DIAAH, as would the existing Dulles North Transit Center at the Route 606 station. The existing Reston East facility would be expanded as part of the Wiehle Avenue Extension to support the interim end-of-line terminus at Wiehle Avenue and would continue to support the Wiehle Avenue Station when the Full LPA is constructed.*

Need to Notify Landowners

Public Comments: We live at 1824 Baldwin Drive and are opposed to the tie station proposed to be constructed at the end of Baldwin Drive. Please be sure we are notified of the upcoming neighborhood hearings on that topic so we may attend and express our views. (0124, 2-01)

> ***Response:*** *The property owners and tenants of the Baldwin Drive residences participated in the May 2004 post-hearing conference and associated outreach activities.*

Important Information Omitted

Public Comment: We question, however, the decision to omit from Appendix E the attachments to HBL's December 29 written submission. Users of the appendix are not able to see the drawings of the final

specific alternatives HBL suggested for the Tysons West Station facilities. The public also may miss the comments (submitted through HBL as attachments) of two prominent area property owners in support of HBL's concerns. Additionally, we believe it would be helpful to stakeholders and the public at large to post the appendices to the Public Hearings Report on the project website (www.dullestransit.com). (0070, 2-02)

> ***Response:*** *The Project Team added the color version of the attachments to Appendix E of the Supplemental Draft EIS Public Hearings Report. There has not been a demand that the public hearings record be posted at the project web site. In addition, the record is so voluminous that the posting would be impractical and costly.*

More Parking at Wiehle Avenue Station

Public Comment: I think that expanding the parking at Reston East on Wiehle Avenue should be a separate item from the Dulles Corridor project. More parking needs to be created sooner rather than later regardless of the progress (or lack thereof) of light rail or rapid bus transit. The lot fills up much earlier than it used to forcing us to get up and out of the house earlier. (0135, 2-01s)

> ***Response:*** *Fairfax County had initiated a feasibility study of Park-and-Ride expansion, but placed that study in abeyance in 2001 while it awaited the outcome of the Dulles Corridor Land Use Task Force and the results of the NEPA analyses for the No-Build Alternative of the Dulles Corridor Rapid Transit Project. In the NEPA analysis, the Project Team assumes that the Reston East parking facility will have 2,300 spaces before 2010. In other words, if the Project is not built, Fairfax County would likely expand the park-and-ride structure.*

Inadequate Number of Parking Spaces in Corridor

Public Comment: Again, it appears the project team failed to address the statistics I provided above, particularly on the ratio of parking to passengers at the western-most Orange Line stations, vs. the paltry amount of parking provided at the proposed Dulles Rail stations. I request the project team address their overly optimistic assumptions of having people take buses to the Wiehle Station versus those who want to park and ride. Again, how can you anticipate 29,000 riders on LPA 1 if you only are providing 2,800 parking spaces at stations and 6,180 spaces total, including bus lots. And, you now have to factor out express bus riders from Loudoun County as per the request of the Board of Supervisors (see Email from Karl Rohrer to John Clark)? (0112, 2-05)

> ***Response:*** *The number of park-and-ride spaces in the Dulles Corridor has been determined based on travel demand, available land, the capital funding plan and the currently-adopted plans of local jurisdictions for park-and-ride expansion. The travel demand forecasting analysis has taken into account that number as well as the number of riders that will access the Metrorail stations by bus, Kiss & Ride and walking. The methodology of the demand forecasting is documented in the Travel Demand Forecasting Methodology and Results Report (June 2002). The commenter also incorrectly used two sets of numbers in his evaluation: his citation of 29,000 boardings is for the LPA in 2025 and his citation of 6,180 park-and-ride spaces is for the Wiehle Avenue Extension in 2011.*

2.3 SUPPLEMENTAL DRAFT EIS ALTERNATIVES

A. Draft EIS Comments

No comments pertaining to this topic were received

B. Supplemental Draft EIS Comments

Federal Agency Comments

Recommend Build the full LPA

Federal Comment: We encourage the development of the full Metrorail alternative because with the highest ridership, it will have the greatest capacity of moving people through the corridor, and should have the greatest impact on reducing congestion and air pollution. (0085 0100-2)

> ***Response:*** *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

State Agency Comments

Need for Concurrence with Comprehensive Planning

State Comment: Please reference the possible future profile of Route 7 that would conflict with the relocation of the Tysons Central 7 Station entrance and specifically describe the conflict. It should be noted that any future roadway improvements envisioned in Tysons Corner are based on the Fairfax County Comprehensive Plan 2000 and were applied in VDOT's Transportation Collocation Study 2003. The design shown in the Collocation Study is just one possible future option for Route 7 in the vicinity of Tysons Central 7 and no profiles for this design have been published by VDOT. Further analysis is required to determine if moving the station entrance to the middle or west side is feasible. (0091, 2-01)

> ***Response:*** *As indicated in the General Plans (Final EIS Volume V), the entrance for the Tysons Central 7 Station is located at the inbound/east end of the station. Relocation of the Tysons Central 7 Station entrance to the outbound/west end of the platform would result in conflicts with existing development, and with possible future profiles of Route 7 envisioned by VDOT. The VDOT Transportation Collocation Study depicted a grade-separation of Route 7 beneath Westpark Drive as part of a proposed interchange. Elements of that interchange would be in conflict with a station entrance at the outbound end of the platform. Making provisions for a second entrance and the associated mezzanine and support facilities would have a substantial capital cost premium. The benefits in terms of any additional ridership would be minimal, and significant additional yearly operational and maintenance costs would result.'*

Tysons West Station Entrance and Facilities

State Comment: Needless to say, there is substantial concern that the Project Team's assessment is correct and that the proposed station would increase traffic congestion, be inconvenient to pedestrians and discourage ridership.

The EIS proposal also appears unnecessarily costly. (0156, 2-01)

State Comment: The success of the Dulles Rail Project is vital to Northern Virginia. Yet, unless costs are controlled and the needs of pedestrian and commuters are served to the fullest possible extent, the Project map be placed in jeopardy. I share the concerns of the McLean and Fairfax organizations as well as the Fairfax Board of Supervisors and urge you to adopt an alternative that would meet their goals and respond to their concerns. (0156 2-02)

> ***Response:*** *The Project Team conducted a post-hearing conference on the Tysons West Station entrance and facilities. The decision-makers selected Option E site plan for the Tysons West station facilities to that of the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from*

Route 7. In comparison to other options considered, Option E was foremost in transit customer convenience and safety and best serves the goals of the Project.

Your statement's citation from the Project's Station Access Study was applicable when the Station had a 2,000-space park-and-ride facility. In response to the public hearing record of Summer 2002 and based on the cited study, the Project has programmed only 500 spaces. Based on WMATA's experience with existing stations, this reduced facility would be full prior to the morning peak hour. Therefore, it should not cause an impact on the adjacent roadways.

Regional Agency Comments

Impacts on the Dulles Toll Road

Regional Comment: The discussion of the proposed Route 28 Station (page 2-32 of the SDEIS) indicates that the DIAAH would need to be realigned to accommodate the proposed station, and that the Dulles Toll Road would need to be realigned to allow future construction of a third lane in each direction on the realigned DIAAH. The SDEIS declares that the "future effects of this widening are no longer assumed to be a direct effect of the Dulles Corridor Rapid Transit Project." The Airports Authority strongly disagrees with this assertion. In our August 27, 2002 comments on the Draft EIS, we stressed our future plans to widen the DIAAH to six lanes, and we emphasized the need for the Dulles Corridor Rapid Transit Project not to infringe on the right-of-way for the future widening. Realignment of the Toll Road to preserve this right-of-way is indeed a direct effect of the Dulles Corridor Rapid Transit Project, and the effects of this realignment need to be addressed in the EIS for the Dulles Corridor Rapid Transit Project. (0131 0166-4)

Response: *If the program of the Metropolitan Washington Airport Authority to widen the DIAAH to six lanes is before, during or soon after the completion of the Full LPA, the Project Team will consider the realignment of the Dulles Toll Road as a direct effect of the Project. If the program to widen the DIAAH is long after the completion of the Full LPA, the Project Team will regard the realignment of the Dulles Toll Road as an effect of the widening project. For the purposes of the Final EIS and General Plans, the Project Team will incorporate the widening project into both documents.*

Need Memorandum of Understanding for full LPA

Regional Comment: The Airports Authority is disappointed that the Federal Transit Administration is considering only a first phase on construction, from West Falls Church to Wiehle Avenue, for inclusion in the FY 2004-2009 New Starts Program, and is making no commitment to funding the completion of the project to IAD and beyond. Nevertheless, we are pleased that the proposed Phase I does not stop at Tysons Corner, but carries the project back to the median of the Dulles International Airport Access Highway (DIAAH).

The Authority's continued support of the project is subject to three conditions: 1. The FTA reauthorization process needs to recognize the ultimate goal to complete the rail line out to and beyond IAD. 2. Advanced additional engineering, must proceed beyond the initial segment and include the entire project. 3. There needs to be a Memorandum of Understanding among the local partners that captures a joint commitment to see the entire project through to completion. (0131 0166-1)

Response: *It is proposed that the Full LPA be constructed. However, based on agency coordination, DRPT and WMATA have revised the LPA to allow for construction of the project in two phases. Guidance on federal funding limitations and the timing of local funding availability were considered in determining the proposed phasing. An interim end-of-line at Wiehle Avenue would allow the initial Dulles Corridor line to provide the maximum benefit possible with the available resources. When the Wiehle Avenue Extension is complete, the initial segment of the Dulles Corridor line would serve approximately 65 percent of the passengers attracted to the full*

LPA. DRPT will continue to coordinate with MWAA to address the concerns identified in the above comment.

Local Agency Comments

Need to Consider Alternative Parking Locations

Local Comment: It should also be noted that in your operating plan for Phase 1 we feel it would be much more advantageous to build commuter parking at the future Rt. 772 station than to expand parking at Dulles North, where we currently have several hundred excess spaces. (0084 2-04)

Response: *In response to the request of Loudoun County, the Project Team has redefined the Wiehle Avenue Extension assumptions, particularly the bus operating plan and the General Plans, so that there is a transit center with bus facilities and park-and-ride at the future Route 772 Station. The Team has deleted references to the supplemental park-and-ride from the site of the future Route 606 station facilities. The Route 772 transit center uses the site of the north side park-and-ride structure of the full LPA. However, the site and its neighboring parcels are undeveloped as is the roadway network. If the roadway network, which will be built by future, adjacent development, does not exist in advance of the opening year of the Wiehle Avenue Extension, DRPT will consider the postponement of the construction of the transit center; its intermodal functions of park-and-ride and bus bays may be temporarily located in the locale of the site. In addition, DRPT will be determining the funding sources of this transit center during the preliminary engineering phase.*

Endorsements of the LPA

Local Comment: Loudoun County strongly endorses this project. It is vital to our future economic success, the management of traffic congestion, improved air quality and will be a major determinant of how we mature as a region. (0066074-4)

Local Comment: TOWN OF HERNDON, VIRGINIA, RESOLUTION, AUGUST 13, 2002. Resolution-Recommending a Locally Preferred Alternative (LPA) and Other Considerations to be Forwarded to the Washington Metropolitan Area Transportation Authority (WMATA), the Virginia Department of Rail and Public Transportation (VDRPT) and the Commonwealth Transportation Board (CTB) as a Response to the Draft Environmental Impact Statement and Proposed General Plans of the Dulles Corridor Rapid Transit Project. (0132 0171-06)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in developing the LPA.*

Recommend Build the Full LPA

Local Comment: Economic reality in Federal appropriations may require that the project be divided into two phases, but it must be viewed as one project. It should be noted that Loudoun County has put in place funding mechanisms to fully fund its share of the project. There has never been any doubt as to Loudoun's financial commitment to this project either with the original single project or the currently proposed two-phase project.
66 0074-1

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Vehicular Access to Parking at Stations

Public Comment: On the two Route 7 stations, we believe that there needs to be additional look at where those stations entrances are. We believe that those stations should both have entrances at both ends, if possible. (0117 0146-1)

Public Comment: For the Tysons Central 7, the underground station, we think that if it can't have two entrances that-- and it has only a single entrance, that entrance should be on the west end and not the east end. (0117 0146-2)

> ***Response:*** *The Project Team conducted a post-hearing conference on the Tysons West Station entrance and facilities. The decision-makers selected the Option E site plan, which has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.*
>
> *For Tysons West Station and Tysons Central 7 Station, making provisions for a second entrance and the associated mezzanine and support facilities would have a substantial capital cost premium. The benefits in terms of any additional ridership would be minimal, and significant additional yearly operational and maintenance costs would result.*

Parking Related to Development Opportunities

Local Comment: Tysons West station: consideration should be given to locating the bus facility and parking to the south side of Tyco Road; the purpose is of relocating the facility is to improve joint development opportunities, to improve pedestrian access and to have potential improvement in bus access; for example, two points of access (one from Tyco Road and one from Spring Hill Road should be considered for this facility.(0093 0109-18)

> ***Response:*** *The Project Team conducted a post-hearing conference on the Tysons West Station entrance and facilities. The decision-makers selected the Option E site plan, which has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7. In comparison to Options A, B, C and D, Option E was foremost in transit customer convenience and safety and best serves the goals of the Project.*

Local Agency Comments

Commitment Should Remain for full LPA

Local Comment: The most pressing issue is the need to complete the full Locally Preferred Alternative (LPA) by the current scheduled date of 2015. There are those who would oppose this on the grounds of cost and number of riders served. This is based on the false assumption that Bus Rapid Transit (BRT) can handle the future transit needs of the Dulles Corridor. The use of BRT in lieu of rail takes on some apparent credibility when viewed in the strict context of Environmental Impact Analysis. The analysis year of the EIS is 2025, with phase 2 not operational until 2015. It is shortsighted to measure a system that will last a century by what it will deliver in a decade.(0074-3)

> ***Response:*** *2025 was used as the project horizon year because it allows a comparison to be made of the alternatives in a future year in which they would have achieved their full potential. The Project Team has used the Metropolitan Washington Council of Government's (MWCOG) Cooperative Land Use Forecasts - Round 6.3, which does have a later forecast year of 2030. However, to remain consistent with past NEPA analyses and results that are documented in the Draft EIS and Supplemental Draft EIS, the Team has retained a forecast year of 2025 for the analyses in support of the Final EIS.*

Local Comment: Loudoun County takes strong exception to the statement in the Executive Summary, "FTA had determined that the first phase now being considered for the funding has independent transportation utility even if the subsequent phase is never built." (p. s-3) To terminate this project at Wiehle Avenue would undermine land use policies of neighboring Fairfax County, and would forever condemn the economic future of one of the premiere development corridors in the United States. (0066 0074-2)

> ***Response:*** *Based on agency coordination, DRPT and WMATA revised the LPA to allow for construction of the project in two phases. Guidance on federal funding limitations and the timing of local funding availability were considered in determining the proposed phasing. An interim end-of-line station at Wiehle Avenue would allow the initial Dulles Corridor line to provide the maximum benefit possible with the available resources. When the Wiehle Avenue Extension is complete, the initial segment of the Dulles Corridor line would serve approximately 65 percent of the passengers attracted to the full LPA.*

Public Comments

Need to Consider Other BRT Alternatives

Public Comment: This is a terrible waste of money! I won't use it but will have to pay for it. Go with the cheaper bus proposal. (0457, 0457-L –1)

> ***Response****: Your participation in the public hearings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to the Project Team and were considered by decision-makers in the selection of the Locally Preferred Alternative. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT, the BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comment: BRT could offer express service from Dulles airport or Tyson's corner, significantly reducing travel time. BRT also could offer flexible service, operating both on separate rights-of-way and around office parks, malls, and neighborhoods. (0444, 0444-E-4)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. BRT, the BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS. The BRT service for the Dulles Corridor Rapid Transit Project analyzed in the Draft EIS was intended to serve the same type of travel needs as the proposed Metrorail service. The proposed stations for both modes were placed where they best respond to anticipated demand in the corridor. Therefore, stations are located at or near existing and planned activity centers in the corridor and at existing park-and-ride locations.*
>
> *It would be very difficult to provide a cost-effective service for the Dulles Corridor using several, dedicated express routes. For a point-to-point transit service to be as efficient as possible, it must be able to attract a large number of travelers within a relatively small area at the origin end that all want to go to the same destination (or multiple destinations within a small area). Travel time at the "circulation and distribution" end of the trip should not be more than 10 minutes, or the increased travel times make the dedicated service a less attractive travel alternative.*
>
> *Most travelers in the Dulles Corridor are coming from dispersed, lower-density locations throughout the region, and traveling to dispersed destinations throughout the corridor and the region (some high-density, some not). While travel within the corridor and between the corridor and the region is significant, travel from each dispersed location is, in general, not significant enough to support a dedicated, point-to-point type of service. Therefore, it would not be efficient*

or feasible to provide rapid transit improvements in the Dulles Corridor primarily using a series of "one-seat ride" express services with circulation/distribution at either end.

Public Comment: I support BRT in the Dulles Corridor as well as along I-66 from the Vienna Metro out to Haymarket with corresponding BRT stations at Route 123, Fair Oaks, Fairfax Pkwy, Route 28, Compton Rd, Route 234 Business, Route 234, PW Pkwy, Route 29, and finally Route 15. Furthermore, this I-66 line and the Dulles line should intersect BRT lines that operate along the Beltway, Fairfax Parkway, Route 28 and the PW Parkway in dedicated HOV lanes. Where these concentric lines intersect VRE, there should be major stations to facilitate intermodal transfers. In time, select BRT lines could be upgraded to light rail as needed. (0408, 0408-E –1)

***Response**: The Draft EIS considered rapid transit improvements within the Dulles Corridor. Alignments outside the Dulles Corridor are beyond the scope of the study. Other transportation improvements (both highway and transit) outside the Dulles Corridor are recommended in the Northern Virginia 2020 Plan, Statewide Transportation Plan, and local comprehensive plans and are being pursued by VDOT, DRPT, and others. This program of improvements is intended to increase mobility and address the existing and potential future deficiencies in Northern Virginia.*

Need for Additional Public Forums

Public Comment: The NMTC is disappointed, however, that the Project Team will not conduct a similar conference for the Tysons Central 7 station. The NMTC continues to believe strongly that the proposed station entrance design is not a good one for pedestrian and bicycle access. The Project Team needs to give much more thought to alternative designs for this station. A post-hearing conference would be a very good way to receive input from stakeholders, reassess the access needs for this station, and discuss the site issues that affect the ability to implement the various alternatives. Because of this, the NMTC requests that the Project Team conduct a conference for this station. (0117, 2-01)

***Response:** As indicated in the General Plans (Final EIS Volume V), the entrance for the Tysons Central 7 Station is located at the inbound/east end of the station. Relocation of the Tysons Central 7 Station entrance to the outbound/west end of the platform would result in conflicts with existing development, and with possible future profiles of Route 7 envisioned by VDOT. The VDOT Transportation Collocation Study depicted a grade-separation of Route 7 beneath West Park Drive as part of a proposed interchange. Elements of that interchange would be in conflict with a station entrance at the outbound end of the platform. Making provisions for a second entrance and the associated mezzanine and support facilities would have a substantial capital cost premium. The benefits in terms of any additional ridership would be minimal, and significant additional yearly operational and maintenance costs would result. The Project Team will continue to coordinate with Fairfax County, VDOT, property owners/developers and other stakeholders on issues of pedestrian access to the Tysons Central 7 Station.*

Commitment Should Remain for full LPA

Public Comment: The Fairfax County Non-Motorized Transportation Committee (NMTC) is pleased that the Project Team has recommended that the Tysons West station entrance be placed at the eastern (Spring Hill Road) end of the station. The NMTC supports this recommendation.

We offer the following additional comments on the proposed station design:

1) We believe that the entrance to the pedestrian bridge over Route 7 should be located at, or at least nearer to, the corner of Rt. 7 and Spring Hill Rd. rather than at the proposed location adjacent to the Kiss-and-Ride and bus facility. The proposed location is convenient for those arriving by car or bus, but less convenient for all other pedestrians entering the station from the north side of Rt. 7 (this is likely to be the majority of people entering the station from that side). If the proposed location is used, pedestrians approaching the station entrance along Rt. 7 would first have to walk a ways up Spring Hill Rd., enter the pedestrian bridge, and then backtrack along Spring Hill Rd. on the bridge to the station. Locating this

entrance at the corner makes it more convenient for all pedestrians entering the station from the north side of Rt. 7 without adding any distance to the walk of people arriving by car or bus.

2) We believe that the station design should not preclude easily adding a second station entrance at the west (Tyco Rd.) end of the station. The station design should allow this entrance to be added inexpensively in the future if and when development and demand is adequate to justify it. (0117, 2-03)

Public Comment: (1) consideration be given to adding second entrances to the two proposed stations along Route 7; (2) failing that, there should be at the very least provision in the initial construction of those stations for additional mezzanines or supporting piers and other structural elements that would avoid undue expense and operational interference if second entrances are added at later dates; (3) if there is to be only a single entrance at the Tysons Central 7 station, it be located at the middle or west end; and (4) at the Tysons West station, the platform be extended over Spring Hill Road and Tyco Road to reduce the need for pedestrians to cross those busy streets.(0034 0035-2)

Public Comment: The biggest thing is for the two stations on Route 7, we would like to see if at all possible two entrances on each station. And if that's not possible for financial reasons, we think that there should be taken at least the prudent step of providing the mezzanines or the support columns or whatever other support structures are necessary to assure that when at some future date second entrances are added, it could be done without interfering with existing service or experiencing undue cost.(0034 0143-2)

Public Comment: If there is to be single entrances, we suggest that the Tysons Central 7 station that they be located either at the middle of the station area or on the west rather than the east where it's located presently. The east presents a substantial problem of pedestrian access.(0034 0143-3)

Public Comment:…we would hope that the station would be designed with the ability to have a pedestrian bridge at the west end since you're now going to put the station, the entrance of course on the eastern end, we would hope that you would not preclude the ability to have a pedestrian crossing on the Route 7 on the western end…at Tyco Road. (0117, 2-05)

Public Comment: If the Kiss & Ride and bus transfer facilities are shifted east, we would urge VDRPT and WMATA to consider the inclusion of pedestrian access to the Tysons West Metro Station from the western end of Leesburg Pike….the elimination of a pedestrian connection near Tyco Road (as originally planned) would be a significant loss. The western pedestrian connection to the Station is desirable as it will allow many nearby properties to be well-served by convenient, safe access to the proposed Transit Station. (0075, 2-01)

> ***Response:*** *The issues are which set of patrons will be inconvenienced and to what degree the Cherner Isuzu-Kia dealership is affected by the pavilion location.*
> *In the current site plan, patrons arriving via the sidewalk of the Route 7 would have a walk of 150 feet to the base of stairs of the north entrance pavilion, or about 280 feet to the base of the escalators the pavilion. The dealership retains its frontage on Route 7 and has a low number of display spaces displaced by the piers of the bridge. In the proposed site plan, patrons using the sidewalk of the Route 7 would have a shorter walking distance (about 120 feet), to the base of escalators, which would remain oriented towards the bus facility. Patrons arriving via feeder bus and Kiss & Ride would have the same overall distance to the station mezzanine but would walk longer to reach the full enclosure of the north entrance pavilion. In this case, the dealership would lose its corner frontage and several display spaces. In consideration of a patron's total travel time and distance and to minimize impacts to the existing automobile dealership, the Project Team is advancing the current Option E site plan into preliminary engineering.*
>
> *The location and number of entrances has been a part of the analysis and the subject of continuing coordination with Fairfax County throughout the environmental review process. The documentation provided in the Final EIS and final General Plans represents the consensus relative to serving the rail passenger demand, existing and future development, and consideration of available funding. Making provisions for a second entrance and the associated mezzanine and*

support facilities has a substantial capital cost premium. The benefits in terms of any additional ridership would be minimal, and significant additional yearly operational and maintenance costs would result.

The plan of the station's mezzanine level includes not only the fare gate array and the pedestrian bridge connection, but also various rooms for Metrorail operations. These rooms are located at the opposite end of the station in the place of the proposed second entrance, escalators and stairs. To accommodate a future second entrance, these rooms would need to shift onto an extension of the station's mezzanine beneath the revenue and pocket tracks outbound of the station, design changes that would substantially increase the Project's capital costs. If constructed, a second entrance would nearly double the operating costs for a given station. Until recently, no Metrorail station in Virginia had a second entrance. At this time, King Street Station is receiving a minor second entrance, which was initiated by the City of Alexandria and Ballston Station might receive one, as planned by Arlington County and WMATA. Given these aspects, the Project Team is not considering accommodation of a second entrance at this station.

Relocation of the Tysons Central 7 Station entrance would result in conflicts with existing development, and with possible future profiles of Route 7 envisioned by VDOT.

Potential Economic Impact of Relocations/Station Construction at Tysons West Station

Public Comment: HBL of Tysons makes a significant employment and financial contribution to Fairfax County and to the Commonwealth of Virginia. HBL's current data show that, during 2004, it employs 359 persons. The following table shows the taxes HBL paid or collected during 2003 and expects to pay or collect for 2004…These tax payments reflect $300 million in HBL annual sales and services.

Displacing HBL's business on the north side of Route 7 and impairing HBL's remaining operations, on the south side, as would result from the adoption of Option A, would have major adverse direct economic impacts on HBL. It would eliminate between 100 and 150 jobs. Annually, it would cause Fairfax County and the Commonwealth of Virginia to lose between $3 million and $4 million in tax revenues and it would eliminate approximately $100 million in business activity in Virginia. (0070, 2-03)

Public Comment: …we feel that Options A and B are not workable in their current form in terms of the impacts to the commercial properties along Route 7 and their redevelopment potential. (0053, 2-01)

Public Comment: Like the Cherners, my father and grandfather started this business. We owned four pieces of property in the Tyson's area….We have one other small one and, of course, our dealership, which is Option B…And this is all we have left….This is our sole asset. There's this one dealership, no other used-car lots anywhere; no Starbucks in another place; no office buildings that we own. This is it for my family. My grandfather comes to work; me, who comes to work; and my father. The choice of B would be devastating to my family.

Also, like the other two businesses, [Option B] would be devastating to our employees. We have some employees who have been with us for decades.

I would implore you to try to find an option that could save the three businesses; but yet still have a Kiss-and-Ride; still allow people to walk to the Metro station; allow us to develop the properties when the time comes for something beautiful, for something nice….find an option that will save everyone's jobs, keep taxes coming and allow us to prosper. (0158, 2-01)

Public Comment: …we feel that Options A and B are not workable in their current form in terms of the impacts to the commercial properties along Route 7 and their redevelopment potential. (0053, 2-02)

Response: *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C.*

Support for Tysons West Option B

Public Comment: To be successful, RMC-TYCO believes that the traffic considerations in the future should outweigh other considerations. It is obvious that Option B has the best properties for a successful station in the future, followed closely by Option A. (0157, 2-01)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C. The Tyco Road access to the station facilities would affect the access to the nine businesses of the RMC-TYCO property by closing the east entrance of the property.*

Opposition to Tysons West Option B

Public Comment: We emphatically oppose Option B because of its devastating impact upon the Peacock family's principal assets-their dealership and the land on which it sits. Compounding the inequity of selecting Option B is the fact that this would become the second property the family has owned in Tysons taken for public use. The first property became the location for a county fire station.

Regardless of any purported technical advantages, it would be indefensible to displace Peacock Buick while the Security Storage site lies vacant. We understand that the Ourisman family now owns the parcel and has leased it to HBL. Again, any hardship that either of those parties may suffer falls into the category of self-inflicted wounds. They had full knowledge that the Project Team had selected the north side of Tyco Road for the Facilities. That alone should have averted them to the prospect that the Security Storage Property could become the site for the Facilities. In any event, as between a family business that has remained at the same location for over a quarter of a century and a huge multi-state constellation of dealerships that has leased a vacant tract that would not displace an existing business, the hardship factor should tip the balance to the Security Storage site or other more benign locations in the area.

Further, we will request that the Fairfax County Board of Supervisors consider this hardship factor and other aspects of the site selection as between the three options and others that may emerge. We will ask the Board to refine its position accordingly. In any event, we respectfully request that the Project Team as the final arbiter reject Option B. (0136, 2-05)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C.*

Need to Conduct a Soils Study Prior to Site Selection

Public Comment: The RMC-TYCO property is home to nine businesses that likely employ a total of approximately 100 people. Because the RMC-TYCO property is one of the few properties with an I-5 zoning category, it would be virtually impossible for these businesses to relocate anywhere nearby.

…I am sure that cost is a major factor…the warehouse building in the rear of the Cherner Property was built on a significant amount of fill material in the mid-1960's… We would recommend that you commission a soils study before selecting either Option C or Option D…In addition…there is an underground structure between the Cherner Property and the RMC-TYCO Property…. 24" concrete piers every two feet, on center, running along the entire property line. Each pier contains a steel I-beam and sink to a depth of 18 to 20 feet each…to guard against the possibility of damage from any shifting soils on the Cherner Property. (0157, 2-02)

> **Response:** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C. Option E reduces the property acquisition and business effects in comparison to Option C by not removing a building on the RMC-TYCO, LLC property. Therefore, the businesses located in that building would not be displaced.*

The Team did not consider capital costs as a determinant in the evaluation of the options, as explained in the Technical Memorandum. Option E is upon the Cherner property that is earthen fill; the proposed bus loop is adjacent to the property line that is the location of the underground retaining wall. The Project Team will investigate both the fill and wall during preliminary engineering and final design.

Support for Alternative Facility Location

Public Comment: We're an independent service facility…we have over 5000 active clients in the Vienna/McLean area…we operate 12,500 feet, we'd like to stay there as long as possible…Zoning in Tysons Corner for I-5, very limited. If, in fact, you go with options C or D, I would like to see somebody stand up strong to try and offer some more I-5 zoning for us. (0159, 2-01)

Response: *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C. Option E reduces property acquisition and business effects in comparison to Option C by not removing a building of the RMC-TYCO, LLC property. Therefore, the businesses located in that building would not be displaced.*

Potential Displacement Impacts

Public Comment: Currently, Cherner employs over 120 individuals from diverse ethnic, social and economic backgrounds. With family members, Cherner provides a livelihood for over 400 people. Cherner utilizes its entire property, including 8550 and 8536 Leesburg Pike and 1530 Spring Hill Road.

Parallel to our neighbors HBL and Peacock's opposition to Options A and B, the property required in Option C, is largely owned and occupied by Cherner Lincoln/Mercury Isuzu and Kia. This parcel is not only important to the ongoing operation of Cherner, it is critical. It provides essential parking for hundreds of Cherner's vehicles, including new inventory, service vehicle and body shop patrons. In addition, the property houses the Cherner Collision center which generates over 60 percent of Cherner's total profitability. In no uncertain terms, adoption of Option C will force the closure of the entire dealership.

Given limited manufacturer flexibility, and minimum nearby affordable property, Cherner does not have an option to relocate or move any portion of its facilities or business. The loss of 1530 Spring Hill Road would devastate Cherner Lincoln/Mercury Isuzu Kia.

I would like to include for my record, my letter dated February 25, 2004 to Mr. Karl Rohrer, which not only outlines many of the comments this evening, but also several other issues raised by Option C. These include an overall inefficient use of precious property in proximity to a Metro station; the placement of essentially rectangular use in a triangular-shaped property; the negative impact upon 8536 Leesburg Pike, known as Cherner Isuzu/Kia and the isolation of 1568 Spring Hill Road, known as the Miller and Smith Building, which is owned by the Cherner family.

Letter of February 25, 2004

…I would like to express my strenuous objection to Option C provided in the public hearings report…The loss of any portion of this property will destroy the financial viability of the entire Cherner operation….Option C appears to be an underutilization of precious Tysons Corner property…

The property required for Option C currently houses the Cherner Collision Center, is utilized for vehicle preparation, parts storage, primary storage for Lincoln Mercury, Isuzu and Kia vehicle vehicles as well as the Tysons West location of Enterprise Rent-A-Car which operates under a long term lease…This results in the need to carry several hundred vehicles for sale to meet manufacture sales quotas (planning volume).

Option C effectively isolates this property ["East-West Mortgage" building located at 1568 Spring Hill Road]….As such, the potential of a combining the parcels is entirely lost…

Option C will also have a dramatically negative impact on the future redevelopment potential of several surrounding parcels by effectively placing a parking lot in the middle of properties that logically should be combined for a higher and better use.

…the proposed overhead walkway runs directly above a 10,000 gallon gasoline underground storage tank, a gasoline dispensing pumping and is within very close proximity to an existing structure.

Finally, the Comprehensive Planned extension of Greensboro Drive seems to have been ignored and could result in yet another taking of land to the West of our property. (0134, 2-02)

Public Comment: Cherner, Peacock and HBL has several variations of this surface lot that deserve review and further study. These options were developed for study by the architectural firm Davis Carter. … I humbly request that WMATA's project team work with us. And with Chairman's Connolly's office to further study these and even develop other options that share the burden of the required kiss-and-ride facilities. (0134, 2-05)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C.*
>
> *Option E is similar in concept to alternative site plans suggested by various parties in the post-hearing conference record and seeks to maximize use of existing County-owned property behind Fire and Rescue Station No. 29. Although Option E does not entirely eliminate impacts to the buildings and businesses operated at 1530 Spring Hill Road, the total amount of property required has been reduced. The Project Team understands that these businesses are related to the automotive dealership operations and has worked diligently to minimize, to the extent possible, the overall effects to the Cherner property and preserve room for replacement of these operations on site. Because Option E would require the closure of access to the Cherner Automotive Group's operations from Spring Hill Road, alternative access to this portion of their property would be developed in coordination with the property owner during preliminary engineering.*
>
> *The Team is also aware that the affected property owners may seek to advance redevelopment proposals that include land proposed for station facilities. If such a proposal is provided on a timely basis, incorporates the necessary program requirements of the transit facility, and permits the facilities to be in operation upon the station's opening, the Team would consider this proposal in lieu of the recommended site plan.*
>
> *With respect to the extension of Greensboro Drive, the Project Team has suggested to Fairfax County that it consider a grid of local streets in lieu of a multi-lane collector that is currently envisioned in the Comprehensive Plan. Option E offers an option for the future construction of the first of these local streets, connecting Tyco Road and Spring Hill Road.*

Economic Contribution of Nearby Businesses

Public Comment: HBL of Tysons makes a significant employment and financial contribution to Fairfax County and to the Commonwealth of Virginia. HBL's current data show that, during 2004, it employs 359 persons. The following table shows the taxes HBL paid or collected during 2003 and expects to pay or collect for 2004…These tax payments reflect $300 million in HBL annual sales and services.

Displacing HBL's business on the north side of Route 7 and impairing HBL's remaining operations, on the south side, as would result from the adoption of Option A, would have major adverse direct economic impacts on HBL. It would eliminate between 100 and 150 jobs. Annually, it would cause Fairfax County

and the Commonwealth of Virginia to lose between $3 million and $4 million in tax revenues and it would eliminate approximately $100 million in business activity in Virginia.

HBL submits, however, that the Project Team's discussion reveals clearly how the options rank based on the staff's assessments described in the Technical Memorandum. The following chart was prepared by HBL…Summing the individual scores for the six criteria yields an overall score for the option. Thus, Option C scores the highest, while Option A scores the lowest…HBL agrees that those six evaluation measures are appropriate, and HBL does not disagree with the factual determinations stated by the Project Team in the Technical Memorandum.

…HBL has contended during earlier hearings that the significantly lower land acquisition costs for Option C are a factor that merits weight, given that project capital costs clearly are large…

Thus, Option C appears preferable in terms of the selection criteria described by the Project Team in the EIS process and by citizen/pedestrian advocates such as the McLean Citizens Association and the Non-Motorized Transportation Committee.

…while the technical memorandum does not expressly score the four options, I believe from a close reading a clear - or a preferred option - can be gleaned. And that would be Option C if this is to be decided from purely a transportation system perspective. (0070, 2-04)

Public Comment: Neither of the two new alternatives (Option B (Figure 6-2) or Option C (Figure 6-3)) mirror precisely the final specific alternatives suggested by HBL. Although Option B varies from some of the criteria HBL identified as important (e.g., preservation of valuable Route 7 frontage for future development), both alternatives present fair options for further evaluation. Missing from the Public Hearings Report discussion is any explanation concerning the source of the two new options, other potential options that were rejected by the staff, or the respective benefits and shortcomings of the three options. Also, the Report discussion does not disclose the criteria the Project Team intends to employ in evaluating and recommending among the options. HBL will provide its perspective on each option, but developing helpful comments would be facilitated by knowledge of the Project Team's rationale for selecting the three options as well as the decision criteria controlling the evaluation and recommendation process. We request that this information be made available to all interested parties before any studies or evaluations conclude, to allow for adequate public review and possible input. (0070, 2-01)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C.*

Support for Tysons West Option C

Public Comment: …our position … is based on a design criterion that should be the basis for the Tysons West Station...that criterion should be at or near Spring Hill Road…Spring Hill Road is much closer to the main part of Tysons Corner than the west end of the station…pedestrian flow on Spring Hill Road from both directions and along the power-line right-of-way which will eventually have a trail leading to Spring Hill Road. …It also reduces pedestrian and vehicle conflicts. …C would be the closest of the ones on the table so far…
(0117, 2-04)

Public Comment: Option C divides, we think wisely, pedestrian from the vehicular access by using Tyco for vehicular access and keeping Spring Hill Road for pedestrian access.…Spring Hill Road is the natural corridor for residences and Rotunda and other places and businesses.

Option C station entrance is at the south end and that's closest to the local users, whereas Option D would push the entrance northward away from most pedestrian users. (0034, 2-01)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C.*

Opposition to Tysons West Option C

Public Comment: Cherner Lincoln Mercury, Isuzu and Kia (Cherner) is a third generation family owned business which has operated on this property for 35 years. Cherner employs approximately 120 people and utilizes the entire property (comprised of 8550 and 8536 Leesburg Pike and 1530 Spring Hill Road) for its automobile operation. The loss of any portion of this property will destroy the financial viability of the entire Cherner operation resulting in the loss of the dealership, the jobs of those individuals it employs and the loss of significant County and State tax revenues in addition to having catastrophic impact on the future development potential of the remaining properties owned by the Cherner family. The proposal described in Option C also appears to be an underutilization of precious Tysons Corner property while providing a less than efficient solution to the underlying dilemma of adding a bus terminal in proximity to the Tysons West Metro Station.

The property required for Option C currently houses the Cherner Collision Center, is utilized for vehicle preparation, parts storage and primary storage for Lincoln Mercury, Isuzu and Kia vehicles as well as the Tysons West location for Enterprise Rent-A-Car which operates under a long-term lease. Without adequate on-site vehicle storage, Cherner's ability to sell vehicles would be irreparably impaired.

In addition to the three properties mentioned above, the Cherner family owns the "East-West Mortgage" building located at 1568 Spring Hill Road. Option C effectively isolates this property from ever being combined with the adjacent Cherner properties. As such, the potential of a combining the parcels is lost entirely and the larger objective of efficient redevelopment in the immediate proximity of the Tysons West Station is impacted.

Option C will also have a dramatically negative impact on the future redevelopment potential of several surrounding parcels by effectively placing a parking lot in the middle of properties that logically should be combined for a higher and better use. The placement of the bus terminal as described in Option C is simply inconsistent with good planning and aesthetically destroys the County's planned mixed use of this area by not providing ample space for adequate setbacks off a main thoroughfare required by large scale development.

Option C would result in an excessively long walk from the furthest bus drop-off point and even a further walk from the short-term parking area. The proposed overhead walk way described in Option C appears to be the longest of the three proposals and would place commuting pedestrians at the wrong end of the station platform. The impact of the drop off location and the lengthy walkway upon handicapped and disabled riders would also be significant and presumably would be contested by advocates for these individuals.

In addition, the proposed overhead walkway runs directly above a 10,000 gallon gasoline underground storage tank, a gasoline dispensing pump and is within very close proximity to an existing structure. Also, the length of the proposed bus terminal from Spring Hill Road to Tyco Road is lined with an extensive network of above ground, high-tension electrical cables that would require relocation.

The odd shape of the proposed bus terminal in Option C dramatically underutilizes the property in comparison to the same use on a rectangular shaped property. Option C appears to require more property than that reflected in Options A and B. Clearly, a great deal of consideration was given to the design depicted in Option A. The current tenant of the Templeton Property leased that property with full knowledge that WMATA had planned a kiss and ride bus parking facility for that Property. Therefore, the future use of the Templeton Property by WMATA was expected and anticipated by the current tenant. In addition, the contract purchasers of the "Security Storage" parcel (Ourisman Family) intend to build a new Lexus dealership on the property. I think it is fair to assume the Ourisman Family's intent is not to build a brand new, multi-million dollar facility and then hope to redevelop the site once Metro is in place. Aside from the massive investment required to build an automobile dealership, all manufacturers appointing a new franchise require a minimum of 20 years of "site control" at a location. If this assumption is correct, such a development will essentially isolate the "Templeton" property from being joined with the adjacent

"Security Storage" site. Thus the County plan of high-density urban development in the immediate vicinity of the Tysons West Station will be at best postponed for decades if not lost altogether on these key sites.

Finally, the Comprehensive Planned extension of Greensboro Drive seems to have been ignored and could result in yet another taking of land to the West of our property.
It is my conclusion that Option C should not be given further consideration. Given the tremendous impact that Option C would inflict to the future viability of Cherner, the resulting the loss of 120 jobs, the loss of long-term development potential of the Cherner property and the isolation of the East-West Mortgage property from the adjacent Cherner properties, Cherner intends to strenuously object to any taking of its property and to utilize all of the resources at its disposal to insure that its legal rights are protected. (0134, 2-01)

Public Comment: Peacock Buick regards the proposal Alternative C-1 [by HBL], however well intentioned, as both premature and seriously flawed….without further discussions with the Project Team, Fairfax County, members of the Board of Supervisors and other stakeholders, we regard the timing of Alternative C-1 as premature and unnecessarily divisive when open dialogue and consensus have become urgent and immediate needs in this late stage of the process. (0136, 2-01)

Public Comment: …HBL has worked diligently to confer with other stakeholders in an effort to see if transportation benefits on par with Option C could be achieved through a variant of Option C or D.

Now, we have an alternative that we have discussed with some of the stakeholders and, while it is not mature as of today, we did a handwritten drawing which I would like to submit for the record… this alternative would be an amalgam of Option C and Option D. It would preserve a Spring Hill orientation for area pedestrians like C…

…the variant that HBL presented during the May 18 conference was amalgam of Options C and D …it was drawn by hand and required further professional work and analysis…submitted for consideration as Option C-1…Option C-1 has as its principal objectives maintaining the advantages of Option C, while dramatically reducing the taking of Cherner and Tyco LLC properties. (0070, 2-05)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C. The Team determined the suggested Option C-1 was not viable since it lacked certain required elements, such as a bus recirculation.*

Support for Tysons West Option D

Public Comment: Generally, in principle, Peacock Buick prefers Option D over the other options. We should underscore that Peacock Buick only supports this option as the least of the worst choices. It would rather have no Facilities on its property.

There is no law that says condemnation cannot be used to take the dealership and the land on which it lies from a family that has invested three generations….But there is fairness and there is decency and there is equity. And I would hope that when there are viable alternatives that Option D is set aside for that reason….Option D is conceptually acceptable to us and we do not have a strong view about one particular version of this… (0136, 2-02)

Public Comment: Option D has several merits: It protects the existing businesses from being taken. By not forcing a business out of business, it allows the current land owners to develop their property in a timeframe of their choosing when market conditions dictate. It allows for a sensible develop plan for the long term future of Tysons West. And, lastly, it consumes more modestly developed properties to the west and north and even surplus property behind the Spring Hill Road Fire Station. …[Cherner] does not endorse it as it is currently drawn, as such. (0134, 2-03)

Public Comment: We previously submitted a document dated April 27, 2004, providing our technical analysis of the Tyson's West Station options….In short, Alternative D was what we determined was the preferred alternative. Our analysis focused on three things: Vehicular access and circulation; pedestrian access and circulation; and future development potential in the area. (0160, 2-01)

Public Comment: As described in the May 18 testimony of Douglas Kennedy, HBL's consulting engineer, there are two adjustments to Option D that HBL would urge. First, the mid-block point where the pedestrian walkway joins the entrance pavilion should be moved east to avoid a safety problem…Second, we believe that the vehicle access road to Tyco from the Kiss & Ride should be moved north, to where it is under Option C.

We understand that Option D is deliberately designed for the area businesses to share the burden of the station's attendant to this new station. If that is the preferred philosophy, HBL can support Option D or some reasonable modification of it. Regarding Option D, we would urge some modifications and HBL's engineer will elaborate in detail…but we would urge that first the walkway be shifted…slightly to the east. (0070, 2-06)

Public Comment: The four elements that I would like to discuss would be: No. 1 in Option D, we believe that the south pavilion should be shifted slightly to the south between the Rosenthal and HBL and Mercedes parking lots to provide improved orientation of pedestrian access to the Spring Hill Road corridor…The walkway length in Option D, we believe can be shortened by two elements in two proposals we have provided in exhibit form is to angle the bridge crossing along Route 7 to line up between Peacock and Cherner buildings …A second alternative, perhaps, to be considered would be a bridge through the Cherner property elevated to go to the proposed parking lots. The third element is important …is to consider moving the access onto Tyco Road to the location further east on Tyco Road as envisioned by the alternative C concept. …Finally the options should look…to reduce the footprints of the properties away from Route 7; we think a smaller footprint can be accommodated, which would avoid demolition of the Cherner body shop on Spring Hill Road…We think the alternatives, as considered, would reduce the cost to the development team; improve the circulation; orient pedestrian access toward the Spring Hill Road corridor to the south; and, also, without disrupting excessive destruction to the businesses. And we, think finally, is consistent with the long-term development plans in the County Comprehensive Plan to preserve the development and redevelopment opportunities for properties on Route 7. (0053, 2-03)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C. The Project Team ultimately rejected Option D because of its property acquisition requirements and the long walking distance (700 feet) between the station entrance and facilities. This walk distance would negatively affect transit customer convenience and safety, reduce ridership potential, and conflict with a primary goal of the Project – improving Metrorail passenger access and mobility. In addition, its second access, a connection with Spring Hill Road, cannot be advanced at this time due to its proximity to the driveways of Fairfax County Fire and Rescue Station No. 29.*

Opposition to Tysons West Option D

Public Comment: The MCA prefers Option C to Option D…Option D bus Kiss & Ride space is entirely too long from the entrance to the Metro station. It is more than 700 feet from the nearest point of the facility. (0034, 2-02)

Public Comment: Sunbelt's property is adjacent to the proposed Option D for Tysons West Station Facilities. Sunbelt opposes Option D for the following reasons:

1) Option D will create significant increased traffic on Spring Hill Road. This increased traffic will adversely affect not only Sunbelt, but the other office and retail businesses in the facility of the contemplated Kiss & Ride entrance on Spring Hill Road contemplated by Option D. We understand that the installation of a traffic light at such entrance is unlikely due to the location of the other traffic lights on

this road. As a result of this additional burden on the road and the high density of the area, we believe that the employees and customers of the businesses on Spring Hill Road will face unsafe conditions while attempting to enter and exit from these businesses, and may ultimately result in less business for these companies and/or higher traffic accident rates in this area.

2) In Option D, a building adjacent to the Sunbelt building will be demolished. As a result… Sunbelt must renovate the façade wall of the Sunbelt building which previously was not required to be finished as well as add additional fencing to secure the Sunbelt location. These expenses would create a hardship on Sunbelt that is not anticipated in your plan.

3) The entrance / exit lane for the Kiss & Ride will be close to the Sunbelt building. Such proximity may cause excessive vibration within the Sunbelt building that would adversely affect Sunbelt's business. (0161, 2-01)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C. Option E does have a possible, later connection with Spring Hill Road at the same location as Option D, but that connection cannot be advanced at this time due to its proximity to the driveways of Fairfax County Fire and Rescue Station No. 29.*

Need to Balance Project and Business Needs

Public Comment: …we [three auto dealerships] have the heightened concern that the Project Team may prematurely settle on a configuration for the Facilities that unnecessarily displaces one or more of the dealers, constrains flexibility and fluidity that can accommodate virtually certain changes in Fairfax County's Comprehensive Plan for parcels surrounding the Tysons West Station and that allow for incorporating the Facilities in future development.

Peacock Buick requests that the Project Team consider measures to bridge the gap between the Project Team's need for certainty and the other stakeholders' need for flexibility.

The prospect of finding solutions later in the process offers little confidence to Peacock or others whose businesses face extinction if the Project Team selects an option that consumes a substantial amount of their property.

We are presently in an annual plan review…There are many, many nominations of parcels along Route 7 in this annual plan review that will propose changes built on the concept of a Tysons city…. it may be useful for the project team and for you in your final deliberations to have an option that you can see today that works and a contingent option for the future that may fit, assuming that some of the amendments are made and dramatically change the face of the area. (0136, 2-03)

> **Response:** *The process of environmental review and facilities planning is at a close. The Project's next phase of the preliminary engineering will advance the selected location and design of the Tysons West Station and facilities.*
>
> *The Team is aware that the affected property owners may seek to advance redevelopment proposals that include land proposed for station facilities. If such a proposal is provided on a timely basis, incorporates the necessary program requirements of the transit facility, and permits the facilities to be in operation upon the station's opening, the Team would consider this proposal in lieu of the recommended site plan.*
>
> *The Project Team does await the effort of Fairfax County to coordinate a relocation of Fire and Rescue Station No. 29. If that coordination is timely, the Team and the County may consider an alternative site plan with less effect upon the Cherner Automotive Group's operations.*

Need to Revise Tysons West Option C

Public Comment: Since no long term park-and-ride spaces will be provided in the station plan, the kiss-and-ride spaces become hugely important. Feeder bus bays must be as close as possible as bus passengers have already to walk to the bus and will have to walk again from the train.

If Option C can be rearranged to add kiss-and-ride spaces, that becomes the obvious best choice. Option D is just too far away.

I am enclosing feeder bus plans to prove that only seven (7) bus bays are needed for Tysons West.

Design can change human nature. The areas of Tysons Corner outside the rail walking distance are very thin transit territory. They need service but existing buses can serve them. We need to remove buses to accommodate rail, not add more.

…Pedestrians must be considered first because you can't have a Metro station without pedestrians and they have be able to get therewith a willingness to approach it.

…there have to be Kiss & Ride spaces for as many people as possible…a reasonable number, like 75 spaces, 60 spaces; not one with 30 spaces or 29.

Bus circulation, I think, is too much…you could do with 9 bus bays or even 9 instead of 11…

Property owners should be protected as much as possible, absolutely, but I'm sure you'll have to pay them if you hurt them. (0054, 2-01)

Public Comment: Of the three that we saw, the one that Mr. Goodman mentioned for a modified version of Option C would be the preferable. However, that seems to involve a substantial walk for the pedestrians, as well as does Option D. And it would also seem to involve a reduction in the Kiss & Ride facilities (0034, 2-03)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Option E site plan for the Tysons West station facilities, which is a variant of Option C and which serves pedestrians better than other options. The Kiss & Ride spaces of Option E are still low in number, less than 25. The number of bus bays has been reduced to 8.*

Need to Incorporate Potential Expansion Elements

Public Comment: This and every Metrorail station should be developed with expansion in mind. Specifically, all stations should allow for future 'express' lines that could bypass certain stations. For example there could be an express train that leaves Dulles Airport and does not make another station stop until reaching Tysons East.

Furthermore, the Tysons Corner stations should be designed in such a way that a future 'loop' could be incorporated. The idea would be that a rider could get off at Tysons West or Tysons East and transfer seamlessly to another system - whether it be Metro or monorail or trolley - that would circulate through all of Tysons Corner. (It is not difficult to imagine that such a loop would be needed within the next thirty years, and so it makes sense now to plan accordingly.) (0162, 2-01)

> ***Response:*** *A third track for express trains is desirable for any rail rapid transit system. However, funding and right-of-way constraints do not allow for a third track. The medians of the Dulles Connector Road and Dulles International Airport Access Highway have sufficient width to accommodate two Metrorail tracks at their closest spacing. The addition of a third track would require a wider median, which would require reconstruction of both the Dulles International Airport Access Highway and the Dulles Toll Road.*

The Project Team did study feeder systems for the Tysons Corner stations as an alternate means of serving the Tysons Corner area, but concluded they were not cost-effective at this time. Additional information is provided in Final Alternatives Analysis Report (May 2001). Fairfax County plans to operate bus circulator service in Tysons Corner to provide service between these Metrorail stations.

Need to Consider Comments in the Decision-Making Process

Public Comment: We have the following comments to make, and we hope these comments and the concerns that are reflected will be given consideration in the future

If in fact, Option E is selected and acted upon, we would request that you consider placing Option E half way on our property and half way on our adjacent neighbor's property. As Option E is presently drawn, 100% of Rosenthal Honda's frontage on Route 7 could be displaced, this frontage is invaluable and cannot be replaced. Instead of dispossessing Rosenthal Honda of ALL of its' Route 7 frontage, we would respectfully request that Option E. be realigned such that the frontage lost between Rosenthal Honda and its' adjacent neighbor be shared equally. We believe that this would be an equitable apportionment of this burden.

If Option E is adopted and pursued and does in fact impact upon Rosenthal Honda, we request that Rosenthal Honda be accorded every opportunity to participate in this project in order to minimize any potential disruption that this project could have upon the dealership's operations. In specific, Rosenthal Honda requests that its' engineers consultants and other professionals be afforded an opportunity to review any future design or configuration of Option E, or any other option that might impact Rosenthal Honda.

Rosenthal Honda would request that any option or design that is adopted, account for providing Rosenthal Honda with maximum efficiency in terms of permitting Rosenthal Honda to continue to use any space that is not absolutely necessary to the operation of the metro station. For example, if the metro station is fundamentally going to be located on above ground platforms, any potential space available on the ground below the platform should be allocated as much as is feasible for Rosenthal Honda's continued use.

Any future construction affecting Rosenthal Honda's property should be conducted with as minimal disruption on Rosenthal Honda's property as possible.

Any signage located on the corner of Route 7 and Spring Hill Road that is lost as a result of this project by Rosenthal Honda, and, or Rosenthal Jaguar/Landrover should be permitted to be relocated and replaced at a reasonably acceptable location, and it is hoped that Fairfax County authorities will cooperate with permitting the dealerships to replace and relocate lost signage.

This project will most likely create disruption and additional parking burdens as well as other operating burdens for Rosenthal Honda. It is requested that Rosenthal Honda be provided with alternative replacement parking and or parking concessions by local government to account for parking deficiencies created by this project. Any parking relocation assistance would be appropriate.

It is requested that Rosenthal Honda be kept fully informed of all developments relating to this project and that the project management cooperate in every manner possible in addressing Rosenthal Honda's future concerns with respect to the impact of this project upon Rosenthal Honda. (0163, 2-01)

Response: *The station entrance of the selected Option E site plan is primarily determined by the north side station facilities, including their pedestrian bridge and pavilion. The pedestrian bridge connects to the station mezzanine at the east or inbound end of the station proper. At this east end is the fare gate array and the south side pavilion, located on the frontage of Rosenthal Honda. There are no practical alternatives to the location of the fare gate array at the east end of the station. To place the fare gate array such that the south pavilion is centered on the property*

line between Rosenthal Honda and HBL Mercedes would shift the pedestrian bridge between the Cherner automotive dealerships and shift the north pavilion from Spring Hill Road and its pedestrian facilities. Such a site plan resembles Option D, which was eliminated from further consideration.

The Tysons West Station straddles the service road and its median with Route 7. To the knowledge of the Project Team, there is no ground level space under the station that is available for dealership use.

Treatment of signage and parking for Rosenthal Honda and other businesses during and after construction will be addressed during preliminary engineering and any right-of-way acquisition negotiations. During preliminary engineering, DRPT and WMATA will continue to coordinate with Rosenthal Honda on the layout and design of the south pavilion in order to minimize the project's effects upon the dealership. A meeting with Rosenthal Honda was held during the review period of the Post-Hearing Conference Report.

Opposition to Tysons West Option E

Public Comment: I have received and reviewed the above-mentioned report and to say the least, I am very disturbed. I have taken the liberty of attaching the letter that I wrote dated February 25, 2004 which details the dramatic impacts that the proposed Option E will have on my family's business. In summary proposed Options C and Option E will force the closure of Cherner Lincoln Mercury and will result in the loss of more than 100 jobs of Cherner employees with broad ethnic and social backgrounds.
The shame of this situation is that there are other options available to WMATA that would not impact existing businesses. The most noteworthy option involves the relocation of the Fire Station to a more suitable location and the utilization of the East West Mortgage parcel (owned by Cherner) along with a portion of the adjacent paved parking area (owned by Cherner). If this option were to be considered, the Cherner family would work closely with your office to explore its physical and financial feasibility. In addition, many of the affected property owners had tentatively agreed to an option that will impact some owners but not destroy existing businesses. Apparently, this option was not given serious consideration.
In all humility, I certainly hope that our stance to vigorously defend a business that has taken three generations to build is not considered unreasonable by WMATA and the Fairfax County Board of Supervisors. We believe that, as fellow members of this community, our situation deserves careful consideration. We hope that any option that will minimize impact to our business will be thoroughly reviewed. Hopefully, such consideration will be to the "alternative site plan to Option E" noted at the end of the Post Hearing Conference Report.

Letter of February 25, 2004
…I would like to express my strenuous objection to Option C provided in the public hearings report…The loss of any portion of this property will destroy the financial viability of the entire Cherner operation…. Option C appears to be an underutilization of precious Tysons Corner property…

The property required for Option C currently houses the Cherner Collision Center, is utilized for vehicle preparation, parts storage, primary storage for Lincoln Mercury, Isuzu and Kia vehicle vehicles as well as the Tysons West location of Enterprise Rent-A-Car which operates under a long term lease…This results in the need to carry several hundred vehicles for sale to meet manufacture sales quotas (planning volume).

Option C effectively isolates this property ["East-West Mortgage" building located at 1568 Spring Hill Road]…. As such, the potential of a combining the parcels is entirely lost…

Option C will also have a dramatically negative impact on the future redevelopment potential of several surrounding parcels by effectively placing a parking lot in the middle of properties that logically should be combined for a higher and better use.

…the proposed overhead walkway runs directly above a 10,000-gallon gasoline underground storage tank, a gasoline dispensing pumping and is within very close proximity to an existing structure.

Finally, the Comprehensive Planned extension of Greensboro Drive seems to have been ignored and could result in yet another taking of land to the West of our property. (0134, 2-04)

> **Response:** *The Project Team will advance the development of Option E during preliminary engineering. However, in response to the Post-Hearing Conference Report, Fairfax County has formally proposed its development of Option F. That alternative site plan would lessen the effects upon the Cherner Automotive Group but would relocate Fire Station 29 and remove the East-West Mortgage office building.*
>
> *DRPT will coordinate with Fairfax County during preliminary engineering to monitor the further development of Option F, assess its associated costs, and determine if it is a viable replacement for Option E.*

Need to Amend Tysons West Option E

Public Comment: Throughout its participation in this process, Peacock has urged that the Project Team mitigate the adverse impact of the Project Team's siting configuration upon all the potentially affected automobile dealers. Consistent with that position, we urge the Project Team to consider changing Option E, if Fairfax County timely relocates the county's fire station from its present site on Springhill Road to a more central site in Tysons Corner.

Peacock also appreciates that in the Report the Project Team stated a willingness to modify Option E to accommodate the redevelopment of the Peacock and Cherner parcels and changes to the Fairfax County Comprehensive Plan for those parcels. We understand that time constraints exist that may ultimately constrain the Project Team's ability to make such changes but applaud the Project Team's willingness to work with the property owners both with respect to design and the form of any future takings.

The Project Team's willingness to accommodate new redevelopment and planning realities reduces the likelihood that the Project's financing and procurement considerations will (1) foreclose desirable redevelopment for the parcels; (2) preclude transportation solutions that may better serve commuters; (3) prevent the needless erosion of the county's tax base by stifling fiscally attractive redevelopment options and the whole or partial displacement of auto dealerships that contribute to the tax base and provide employment to hundreds of workers and vital services to customers.

Finally, with respect to the siting of the Facilities, Peacock requests that the Project Team seek solutions that reconcile the Project Team's need for certainty and Peacock's and other impacted parcel owners' need for flexibility. These solutions may include:

- recognition by the Project Team (which it has already done in the Report) that its site selection decisions for the Facilities could change if the property owners offer alternatives that will better serve specific redevelopment for the subject parcels while satisfying the Project Team's site selection criteria for the entrance and the Facilities;

- obtaining agreements from Peacock and other parcel owners (or their successors) that would run with the land that their redevelopment would accommodate the Facilities (subject to commensurate density credits or other mutually agreeable compensation);

- assisting Peacock, and other impacted owners in crafting proposed amendments to the Fairfax County Comprehensive Plan and Zoning Ordinance to assure consistency between any such proposals with the Project's needs

- a conveyancing agreement by the Commonwealth and landowners that would implement the foregoing objectives, which for illustrative purposes, might involve the Commonwealth's acceptance of an easement rather than the taking of the fee from participating property owners;

- exploring solutions with the FTA to allow for fluidity in the selection of Facilities;

- structuring the design- build contract to allow for fluidity in siting the Facilities;

In conclusion, Peacock supports Option E as proposed in the Report. Peacock would oppose any variation to Option E that would imperil the Peacock dealership and the land occupied by the dealership. However, if Fairfax County timely relocates the county's fire station from its present site on Springhill Road to a more central site in Tysons Corner, we urge the Project Team to change Option E by using the vacated county property to mitigate Option E's impact upon Cherner. (0136, 2-04)

> ***Response:*** *The Project Team will advance the development of Option E during preliminary engineering. However, in response to the Post-Hearing Conference Report, Fairfax County has formally proposed its development of Option F. That alternative site plan would lessen the effects upon the Cherner Automotive Group but would relocate Fire Station 29 and remove the East-West Mortgage office building.*
>
> *DRPT will coordinate with Fairfax County during preliminary engineering to monitor the further development of Option F, assess its associated costs, and determine if it is a viable replacement for Option E.*
>
> *Changes in local land use policies and zoning designations necessary to allow the suggested redevelopment are Fairfax County's responsibility. Accommodations for future redevelopment opportunities will be discussed during preliminary engineering and addressed during DRPT's right-of-way negotiations with the affected property owners and businesses.*

Need to More Finalize Option E Prior to Finalizing NEPA

Public Comment: As the Project Team prepares its supplement to the Conference Report, HBL would urge the Project Team to clarify and limit certain suggestions in the Conference Report that the Project Team might entertain material changes to Option E indefinitely into the future. Further clarification is needed to protect the integrity of the EIS and Record of Decision (ROD) and to provide the public and stakeholders the finality and certainty they deserve after two years of public engagement in the EIS process. In particular, the Project Team should clarify three important concepts:

(1) The scope of permissible development alterations to Option E that might be entertained by the Project Team…to protect the integrity of the Dulles Rail Project's EIS and ROD, the Project Team may wish to clarify the substantive pre-conditions envisioned by the Conference Report. The Conference Report currently states that a property owner may 'advance redevelopment proposals that include land proposed for station facilities.' This should be clarified to specify 'the land proposed for station facilities under Option E.' And where the Conference Report requires a future development proposal to 'incorporate the necessary program requirements of the transit facility', the language should be clarified by specifying the 'program requirements' of the transit facility that must be incorporated;
(2) The timeframe that will be considered "timely" for the proposed development alterations to Option E…. if material and significant variances from the location and configuration of Option E are contemplated, then such variances should be finalized and approved no later than the time the final EIS is submitted to FTA for its preparation of a ROD in the Fall of 2004; and
(3) The process the Project Team would implement to afford the public and/or any stakeholder impacted by any potential development alterations to Option E the opportunity to review and comment…If the Project Team contemplates consideration of one private landowner's proposal of material variances from the final option decision, then a public review and comment process should be provided. This would

provide the public certainty, protect the interests of other stakeholders who might be impacted by any changes, and ensure the integrity of the EIS and ROD.

Without more clarity as to these issues, HBL is concerned that any material changes to Option E in the future may make the EIS and ROD vulnerable. (0070, 2-07)

> ***Response:*** *The Project Team will be proceeding with the development of Option E in the phase of preliminary engineering. The final Team recommendations incorporated the suggested rephrasing of one recommendation, as follows: "advance redevelopment proposals that include the land proposed for station facilities under Option E."*
>
> *The Project Team cannot and will not define the timeframe in which "affected property owners may seek to advance redevelopment proposals that include the land proposed for station facilities under Option E" or the timeframe for the County to develop Option F.*
>
> *Any substantive change to the Project would be re-evaluated in accordance with the National Environmental Policy Act and FTA's implementing regulations and be subject to public review.*

Consider Enhancements to the Existing Bus System

Public Comment: The no-build option is underestimated in that simple and inexpensive enhancements of the current bus system will increase ridership tremendously. (0061 0136-7)

Public Comment: The "no build" option patronage forecasts is underestimated in that simple and inexpensive enhancements of the current bus system will increase ridership. These steps include bus shelters, posted route and schedule times, shelter marquees, and accurate relevant transit information available by telephone. Please revise the "no build" numbers to reflect the increased patronage from bringing the current bus system up to modern standard (0061 0117-10)

Public Comment: Please calculate the effect on ridership for a no-build option if a state of the art telephone enabled transit routing information service could be provided for the bus routes now in operation. (0061 0117-15)

Public Comment: The No Build option is underestimated in that simple and inexpensive enhancements of the current bus system will increase ridership. These steps include bus shelters, posted routes, schedule times, sheltered marquees, and accurate relevant transit information available by telephone. (0061 0069-8)

> ***Response:*** *The No-Build Alternative includes improvements that are included in local and regional long-range transportation plans, including some transit system improvements. Because telephone-enabled routing information systems are not identified by the local jurisdictions as part of their plans, they were not included in the definition of No-Build Alternative. Moreover, the travel demand forecasting model is not sensitive to such passenger-information systems.*

Public Comment: In preparing the No-Build numbers for the DEIS and SDEIS, detail the current patronage figures from the existing bus services by route number and explain your assumptions for the future. Include bus lines 551, 553, 557, 585, 605, 951, 952, 505, 984 and 556 at a minimum. Explain what percentage of carrying capacity each of these lines currently carries, both at rush hours and other times. Also detail usage as a percentage of capacity for the RIBS Reston bus service. (0061 0117-13)

> ***Response:*** *Current ridership figures for these bus routes can be obtained from the Fairfax County Department of Transportation, the operator of this service. This data is not used to estimate future bus ridership in 2025, the analysis included in the Supplemental Draft EIS and Final EIS.*

General Support of the LPA

Public Comment: I'm here to go on the record to say we strongly support this Metro Rail Project. It will go a long way to help resolve many transportation issues that currently exist in Fairfax and Loudoun Counties. (0052 0144-1)

Public Comment: The bottom line is this is really a good idea. We need rail, more rail transit. (0119 0149-1)

Public Comment: I am strongly in favor of rail to Dulles, having experience as both a commuter and now a retiree who uses public transportation to go to activities in DC and beyond. (0120 0154-1)

Public Comment: Rail must happen now. EIS has proven that fact. (0123 0158-13) (0113 0132-11)

Public Comment: Dozens of other nation's capitals in the world have modern high speed transit linkages from their major international airport to the capital. It's time for the United States to catch up if it is, in fact, a world power. (0041 0042-2)

Public Comment: Rail mass transit as an alternative to vehicular access is essential to connect Dulles Airport, Herndon/Reston corridor, and Tysons Corner with the rest of the region. (0042 0043-1)

Public Comment: As I have done in the past, I am here to go on record to say that we strongly support this Metrorail project. It will go a long way to help resolve many transportation issues that currently exist in Fairfax and Loudoun Counties. (0052 0053-1)

Public Comment: I hope that we will be able to complete our commitment that we made when we supported the local preferred alternative in the Corridor. (0058 0059-1)

Public Comment: It is essential that the locally-preferred alternative move forward. (0114 0133-1)

Public Comment: Let's get going with rail. It is way overdue, I face a major challenge in getting downtown. Enough already, let's get on with rail. At least to Reston!! (0030 0031-1)

Public Comment: It is clear that this rail service is imminent, and we are optimistic that this will occur sooner rather than later. (0052 0053-3)

Public Comment: We are pleased to see that the first phase does end at Wiehle, because it does bring it into the corridor, and it will provide a straight shot to Dulles Airport. (0060 0134-2)

Public Comment: We support and are pleased to see that the first phase of the project will end at Wiehle Avenue. This station is a good deal closer to Washington Dulles International Airport than Tysons Corner. (0060 0169-2)

Public Comment: [W]e support rail as the Locally Preferred Alternative but we are here today to support the Phase I plan out to Wiehle Avenue. (0060 0063-1)

Public Comment: I'm very strongly supportive of this application, including the terminus at Wiehle Avenue. (0065 0073-1)

Public Comment: The traffic would be unpleasant during the period that Wiehle is the terminus, but it will be unpleasant during construction and I'd rather endure a mile or two of traffic getting to the Metro than 28 miles of traffic getting into DC. Please don't let a small group of loud activists deter you. It is easier to rile people up to oppose something than it is to support something. Many of my neighbors and colleagues support the Wiehle terminus plan. (00570058-2)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Endorsements of the LPA

Public Comment: The time is now. We have to move forward with this project. I just won an election saying that rail to and through Tysons on the way to Dulles is my top transportation priority and I promise you, over the next four years, it is going to be the top transportation priority of Fairfax County. (0077 0089-1)

Public Comment: The time is now. We have to move forward with this project. I just won an election saying that rail to and through Tysons on the way to Dulles is my top transportation priority and I promise you, over the next four years, it is going to be the top transportation priority of Fairfax County. (0077 0089-1)

Public Comment: Loudoun County strongly endorses this project. It is vital to our economic success, the management of traffic congestion, improved air quality, and will be a major determinant of how we mature as a region. (0114 0133-3)

Public Comment: [Whereas] The Greater Reston Chamber of Commerce (GRCC), representing nearly 1,000 businesses throughout our region and their 90,000 employees, has long supported efforts to increase the mass transit options along the Dulles Corridor; [Whereas] GRCC's commitment to increased transit opportunities and transit-oriented development remains steadfast as shown by our support of the recommendations of the Dulles Corridor Land Use Task Force; (0023 0024-1)

Public Comment: I FULLY support the LPA, including the Phase 1 project to Wiehle Av. Further, I believe the SDEIS is complete & adequate. This project, the LPA, is NEEDED. Please build the project! (0032 0033-1)

Public Comment: I reiterate the Board of Trade's support for the Locally Preferred Alternative because it will produce both the highest ridership levels and provide the greatest support for transit-oriented development. (0069 0077-1)

Public Comment: Tysons Corner Center strongly supports the extension of Metrorail through Tysons Corner onto Dulles Airport and ultimately to Loudoun County. (0075 0086-1)

Public Comment: Today I strongly urge all affected state, local, regional and federal officials to expedite their final review of this supplemental draft EIS, and to move quickly into the final planning and design phases necessary to begin construction of this system. (0041 0042-13)

Public Comment: I know I speak on behalf of the citizens in my area who ask that we build Dulles Rail now. The Dulles Corridor Rail Association organized 20 groups as diverse as the Washington Board of Trade and the Sierra Club, the AAA and League of Women Voters, to say that we support Dulles Rail now. (0037 0060-1)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Recommend Build the Full LPA

Public Comment: I emphasize that, although we do support the plan as presently structured with two phases, we want to make it as clear as possible that we think it is very important to this area that it be extended all the way through Herndon to the airport and to Loudoun County.(0034 0143-1)

Public Comment: What I'm proposing is that we untie, that we cut the gordian knot on this and allocate the phases not in terms of geography but terms of the layer of infrastructure, and begin with what is most important which is to build the rail, build all the rail. (0118 0148-1)

Public Comment: Wiehle Avenue should NOT be considered a terminus for the rail extension, but rather a BRIEF TEMPORARY END to the first phase of the entire 23 mile extension.(0040 0041-1)

Public Comment: [Reston Association] supports extending rail into the Dulles Corridor as proposed in the Supplemental Draft EIS. We believe that it is essential to get rail beyond Tyson's Corner and into the Corridor in the first phase of rail construction. (0039 0040-1)

Public Comment: To this end, we also urge your consideration of the early opening of the Herndon-Monroe and Dulles Airport Rail Stations. (0069 0077-3)

Public Comment: We respectfully urge you to move forward with Phase I of the Locally Preferred Alternative to be completed in 2009 and in doing so commit to completing Phase II of this project ending at Route 772 in Loudoun by 2015. To this end, we also urge your consideration of the early opening of the Herndon Monroe and Dulles Airport rail stations. (0078 0091-1)

Public Comment: I strongly support the construction of the full 23-mile rail transit system from Falls Church to Dulles Airport and beyond, even if this requires a phased funding formula to implement. I, as a citizen and homeowner in Fairfax County, am willing to pay my fair share of the cost to complete the full extension of the transit system in the Dulles Corridor. (0041 0042-1)

Public Comment: I strongly support the construction of the full 23-mile rail-transit system from Falls Church to Dulles Airport and beyond even if this requires a phased-funding formula to implement. (0041 0066-1)

Public Comment: DCRA supports the proposed phased approach for implementing the Dulles rail extension. We emphasize that the Dulles rail extension is a single, 23-mile construction project. (0060 0169-1)

> ***Response:*** *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Advantages of Rail Transit

Public Comment: If you look at K Street, you're going to get eight miles an hour with bus rapid transit. You get five miles an hour now, so it would be a big improvement, but we can't use eight-mile-an-hour transit out here. We need 30-mile, 40-mile-an-hour transit, and with Metrorail we'll get it. (0054 0142-2)

> ***Response:*** *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Support for the DEIS/SDEIS Process

Public Comment: We believe that the Supplemental EIS does not need to be revised, altered or re-advertised to accomplish the two tax district approach, nor are any additional notices of public hearing required to proceed to complete the EIS, obtain a Record of Decision from FTA and commence preliminary engineering. (0123 0158-1)

Public Comment: I now write to reaffirm that support, and to expressly endorse the revisions as shown in the Supplemental Draft Impact Statement and Section 4(f) Evaluation and as highlighted in the associated Executive Summary.(0001 0001-1)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Expedite the Process

Public Comment: We, the organizations listed below, having endorsed rail as the locally preferred alternative for the Dulles Corridor, urge the United States Congress to include the Dulles Metrorail extension from West Falls Church to Washington Dulles International Airport and into Loudoun County in the reauthorization of the surface transportation program act. (0037 0038-1)

Public Comment: Staff working this project should make all aware of the benefits of moving quickly! Help area to comply with USEPA air pollution laws. Help to employ and train construction trades workers. Improve quality of life. Save energy. (0013 0014-1)

Public Comment: Fairfax County and the Commonwealth of Virginia should make it clear to Congress and the Federal Government that this is a 23.1-mile project to Dulles Airport and Loudoun County, and should request that the Congress formally adopt the full project as a Federal Government commitment. (0039 0040-6)

Public Comment: Fairfax County and the Commonwealth of Virginia should make it clear to Congress and the Federal Government that this is a 23-mile project to Dulles Airport and Loudoun County, and should request that the Congress formally adopt the full project as a Federal Government commitment. (0040 0041-3)

Public Comment: [M]ove quickly into the final planning and design stages so that we can make this a reality, rail to Dulles and Loudoun County, as soon as possible. (0067 0075-9)

Public Comment: We respectfully urge you to move forward with Phase 1 of the local preferred alternative to be completed in 2009 and, in doing so, commit to completing Phase 2 of this project ending at Route 772 in Loudoun by 2015. (0069 0077-2)

Public Comment: I applaud your efforts to get this project moved forward as quickly as possible. (0001 0001-2)

Public Comment: We are pleased that the first phase of funding brings rail into the Corridor. We support that phase of funding as you have proposed in the Supplemental Draft EIS. We ask, however, that the funding phases not affect the construction schedule. In that regard, we request that the preliminary engineering be done for the entire project and that the phasing of the financing be seamless in order that the construction be seamless. (0037 0060-2)

Public Comment: Delays in attempts to phase the construction would only add to its cost and would confuse the design and application of the stations. (0037 0060-3)

Public Comment: The economy of the Commonwealth is in trouble unless Northern Virginia continues to grow. The corridor needs rail infrastructure to support this growth. Finally, as the name of our organization implies, we were formed to advocate rail to Dulles Airport and beyond into Loudoun County. We look forward to working with you to expedite the project to Dulles Airport and Route 772 in Loudoun as quickly as possible. (0060 0169-15)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Preference for Roadway Enhancements

Public Comment: - Metro in the Dulles corridor will not enable people to give up their cars.
- People in the Dulles area do not want to give up their cars.
- People don't want Reston/Herndon/Leesburg to be "urbanized". (Most folks moved here to get away from the city.) (0044 0045-3)

Public Comment: What we really need in the Washington area: more highways. We have enough rail. We have a lot of mass transit. What we don't have are the express highways and parkways to get the traffic off the local roads. (0016 0140-4)

Public Comment: On behalf of the National Motorists Association in Virginia, I would like to state our absolute opposition to the Dulles Rail plans. This proposal would burden the people, motorists, and businesses of the area with huge bills to build the system and then ever increasing subsidies as the system becomes a reality. Any system that cannot be paid for by its users is an unfair burden on the rest of us. Metro is a huge turkey who will cost the area and national taxpayers billions more in the coming years just as they did in constructing it.

We don't need or want any more taxpayer-supported transit projects, period. (0015 0016-1)

> ***Response:*** *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Rail is not Cost-Effective

Public Comment: More people walk and bike to work than take transit. Yet, Virginia is only spending 14 cents per person per year of the federal transportation money it receives on these modes, the fourth lowest rate in the country. Dulles Rail, in contrast, will cost $47,000 per year in true subsidies per round trip full time commuter. (0061 0168-1)

Public Comment: One of the conclusions we've come to is that this rail project that you're hearing about tonight is so over-designed and over-expensive that if it were up and running and paid for, it would be so expensive and so deficit-ridden it would make sense to decommission it the day it opened. (0061 0136-1)

Public Comment: I am very much in favor of cost-effective and expeditious mass transit in the Northern Virginia region. Because Metrorail would not provide either cost-effective or expeditious mass transit, I must continue to oppose its use as a Locally Preferred Alternative (LPA), regardless of whether the project is considered as a single buildout or in two phases heading westward. (0068 0173-1)

> ***Response:*** *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Public Comment: The fixed-rail system that seems to be getting the most attention is too expensive. Not only is it not good value for the reported cost, but it is very unlikely that it will ever be constructed because the necessary funding is not available. More economical and flexible alternatives need to be considered. Alternatives with lower front-end costs and that can expand from lower initial use should be investigated. (0007 0007-1)

> ***Response****: Other modes, including the No-Build Alternative, were considered in the Draft EIS published in 2002 for the Dulles Corridor Rapid Transit Project. Based on the analysis contained in the Draft EIS, public hearings held in July 2002, and comments received on the Draft EIS, the Metrorail Alternative (T6/Y15) was selected as the LPA by the Commonwealth Transportation Board and by the WMATA Board of Directors in late 2002. The purpose of the Supplemental Draft*

EIS was to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS.

Rail will not Reduce Congestion

Public Comment: We don't need the capacity that rail will give us. (0073 0083-4)

Response: *Travel demand forecasts completed for the Supplemental Draft EIS and for the Final EIS indicate that significant demand exists for rail service in the Dulles Corridor and further that trains in the corridor will be near a desirable carrying capacity (120 passengers per train car) in the peak hour within the corridor and will exceed desirable carrying capacity in the peak hour further east along the Orange Line in Arlington.*

Public Comment: Our research has indicated that urban areas that have invested in the rail have worst traffic congestion than urban areas that haven't. In short, the research done by LOWER and others indicates that Dulles Rail is a complete waste of money. (0061 0136-11)

Public Comment: The fact that Virginia is seriously considering spending $4 billion on a project that, by its own analysis, will not relieve congestion is a testament to decades of poor planning and an unwillingness to consider new approaches.(00630151-9)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

General Opposition

Public Comment: Another theme has been that the Metrorail alternative has a higher capacity than bus transportation systems. Properly stated, Metrorail has a higher theoretical maximum capacity than bus rapid transit systems, but this theoretical maximum is irrelevant if there aren't enough riders to use it. It is also a poor bargain if the total costs and cost per passenger are excessive, diverting resources from other worthy transit initiatives in the region. Ultimately, the objective should be to move people, not vehicles. (0095 0111-3)

Public Comment: I do not support this transit project.(0109 0147-1)

Public Comment: I do not favor the heavy rail option as discussed in the SDEIS for mass transit from West Falls Church Metro Station to Wiehle Avenue. (0110 0129-1)

Public Comment: In conclusion - Don't build (0033 0034-3)

Public Comment: I, number one, oppose the plan as it is presently constituted. (0072 0082-1)

Public Comment: My analogy for what this project is; it is a broken Cadillac when we should be restricting ourselves to a Toyota Corolla, something practical and inexpensive. (0071 0080-1)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Public Comment: I do not recommend approval of the Dulles Corridor Rapid Transit Project, Phase I to Wiehle Ave. for numerous reasons, including the following:

1. I do not believe that an objective analysis of heavy rail vs. alternative forms of mass transit was conducted. The study was biased toward heavy rail.
2. The heavy rail system proposed for Tyson's Corner has insufficient coverage to warrant the huge cost.

For example, it would be approximately a one mile walk from the Gannett/USA Today building to the nearest heavy rail station.

3. Heavy rail is by far the most expensive option.
4. There is a serious question of heavy rail's viability west of Tyson's Corner.
5. Financial issues such as cost overruns have not been properly addressed.

I strongly support mass transit but believe that the project, as proposed, is poorly conceived. It will do much to harm the cause of mass transit which Northern Virginia so desperately needs. (0112 0131-1)

> ***Response:*** *Other modes, including the No-Build Alternative were considered in the Draft EIS published in 2002 for the Dulles Corridor Rapid Transit Project. Based on the analysis contained in the Draft EIS, public hearings held in July 2002, and comments received on the Draft EIS, the Metrorail Alternative (T6/Y15) was selected as the LPA by the Commonwealth Transportation Board and by the WMATA Board of Directors in late 2002. The purpose of the Supplemental Draft EIS was to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS.*
> *Financial analysis of the system has been an integral part of the project analysis from the very beginning of the project. The financial analysis is documented in Chapter 8 of the Final EIS.*

Vehicular Access to Parking at Stations

Public Comment: 2) Those areas will capture much of eastbound Dulles Greenway traffic seeking to park at the Route 606 station, and to the extent they do so, avoid putting that traffic onto the second road system. Direct access from the Dulles Greenway greatly reduces the number of vehicles which will need to make left-turn movements from eastbound Route606 to the northbound Route 789. The elimination of this movement markedly improves the level of service at the Route 606/Route 789 intersection. (0111 0145-5)

Public Comment: 3) The time and distance for the commuter to locate a parking space is substantially reduced by having direct access from the Dulles Greenway to a parking facility. If commuter will, instead, meet the to park at the SDEIS parking location, then traffic will need to draw it past this location, proceed east on Route 606, currently by a left turn, turn left onto Route 789 and again turn left into the parking facility. Left turns are especially problematic and should be avoided if reasonably possible. (0111 0145-6)

Public Comment: The SDEIS Route 606 station is too remote from future development planned as a transit related employment centers to adequately serve it.(0111 0145-2)

Public Comment: The Greenway was designed and constructed to accommodate the Route 606 rail station in the median at the MIS station location meeting then more modest standards. This benefit is defeated by moving the station to the SDEIS station location.(0111 0145-3)

Public Comment: The supplemental draft environmental impact statement at page 075 of the proposed general plans shows all proposed parking associated with the Route 606 rail station on parcel north of the Dulles Greenway, quote the "SDEIS parking location." Because of the limited size of this parcel, the 2000 Park & Ride spaces must all be within a multilevel structured facility. We propose that parking be located at one or two other areas, each situated on the south and west sides of the ramp for eastbound traffic exiting the Dulles Greenway at Route 606. These alternative parking sites provide the following and other benefits:1) Major cost savings will be realized by substituting surface parking for structured parking.(0111 0145-4)

Public Comment: 4) Impacts on future development will diminish so that greater ridership opportunities can be realized.(0111 0145-7)

Public Comment: Dulles Corridor Rapid Transit Project Route 606 Station and Parking Analysis Performed For Dulles Gateway Associates, L.L.C. and TAB I Associates, L.L.C. 23 December 2003 (0111 0130-1)

Public Comment: We propose that certain adjustments be made to the design of the facilities so that they will far better meet the goals and objectives set out in Table 1.4-1 at page 1-26, Volume 1 of the draft EIS dated June 2002. To meet those goals and objectives, we believe the station needs to be moved back to where it was generally located in the main investment study and that parking should be moved from the north side of the Dulles Greenway to south of the Dulles Greenway. The net effects of making these changes are that project costs will be reduced, ridership increased, traffic disruption during construction lessened, future development better served, travel time for commuters reduced, and long-term level of service of traffic operations in the vicinity of the station substantially improved.(0111 0145-1)

Public Comment: We urge that the Route 606 station be moved to the location identified previously in the Major Investment Study to permit closer access to the planned development.(0060 0169-5)

Public Comment: A major commuter-parking garage should not occupy the "100 percent", highest value site next to the rail station. Rather, efforts should be made to shift the parking to the south where direct access could be provided from the Dulles Greenway and congestion on Route 606 minimized. Please review and select one of the parking alternatives suggested by Dulles Gateway Associates, LLC.(0060 0169-6)

> ***Response:*** *Dulles Gateway Associates, L.L.C. and TAB I Associates, L.L.C., the owner and developer of undeveloped property to the north of the Route 606 Station and the Dulles Greenway, has commented on the Route 606 Station location, access and facilities during the two public comment periods for the Draft EIS and Supplemental Draft EIS and during several coordination meetings with the Project Team. In this Chapter 2 of Appendix J, his comments appear under the commenter identification numbers 0248 for the Draft EIS and its proposed General Plans (June 2002) and under 0111 for the Supplemental Draft EIS and revised General Plans. For the comment period of the Draft EIS, the owner-developer submitted a February 3, 1994 plan titled "Transit Station Site 5-A, Dulles Toll Road Corridor". For the comment period of the Supplemental Draft EIS, the owner-developer submitted a technical report by his consultant, titled 'Route 606 Station and Parking Analysis' (December 2003), on alternatives for the Station's park-and-ride structure and other facilities.*

With his comments on the proposed General Plans (June 2002) the owner-developer submitted an undated development site plan titled "Dulles Gateway North, Sterling Virginia - Antigone Properties" prepared by Leo A Daly. The site plan shows two major developments that are separated by the stream valley and flood plain of Broad Run. Loudoun County in its revisions to its General Plan (a County title for its land use plans) designated the major development north of **Commitment Should Remain for full LPA**

> *the Route 606 Station and east of Broad Run to be a transit node and a Transit-Related Employment Center (TREC). The other major development west of Broad Run is not part of the transit node and can be a TREC only upon certain conditions set forth in the revised General Plans. The owner-developer has identified the development east of Broad Run as Area 1 and west of Broad Run as Area 2. In addition, the owner-development has a land-locked parcel south of the Dulles Greenway and Broad Run and north of Route 606, which he has designated as Area 3. The route from Route 606 to the station facilities is via the existing Route 789.*
>
> *<u>Station Location</u>*
> *The location of the Route 606 Station in the final General Plans is west of the Route 606 overpass of the Dulles Greenway. The Greenway was planned, designed and constructed with a section of wide median to accommodate the future station. The Project Team's design in the final General Plans reveals that the width of median is not sufficient and, therefore, a westbound section of the Greenway must be moderately shifted outward from the median.*

The Route 606 Station has its facilities of bus bays, Kiss & Ride and park-and-ride structure north of the Dulles Greenway on Airport property. North of the station facilities is the Area 1 TREC development.

The station location in the proposed General Plans (June 2002), revised General Plans (October 2003) and the final General Plans differs from the station location that DRPT had identified in its Dulles Corridor Transportation Study of the mid-1990's. The study has been also known by its Federal definition, Major Investment Study or MIS. During the preparation of the proposed General Plans (June 2002), the Team shifted the station approximately 400 feet eastward or inbound from its MIS location for three reasons:

4) *to minimize the height and extent of Station's retaining walls and fill,*
5) *to avoid potential impacts to the existing Dulles Greenway bridges over Broad Run, and*
6) *to avoid impacts to the horizontal clearances between the eastbound lanes of the Dulles Greenway and the southern abutment of the Route 606.*

The owner-developer has consistently commented in the two public comment periods and requested in several coordination meetings with the Project Team that the Route 606 Station be restored to a location that he believes is the one identified in the MIS.

For the coordination meetings and for the Public Hearings Report (February 2004), the Project Team prepared Figure J.2-1 in order to depict the General Plans location versus the MIS location of the Route 606 Station. But, the MIS location differed from the location that the owner-developer believes is the one identified in the MIS. His location is approximately 700 feet further west or outbound from the General Plans location.

In the comparison of the General Plans and MIS locations of the Route 606 Station, the pedestrian bridge between the station and the station facilities (park-and-ride structure, bus bays, and Kiss & Ride) remains in the same location. The travel path from the platform to pedestrian bridge to the station facilities is aligned for extension to a proposed transit node and TREC. The Project Team will be coordinating with the owner-developer so that this pedestrian link will be efficient and attractive.

In his comments, the owner-developer has requested a shift of the station and a second pedestrian bridge and station entrance to serve the development west of Broad Run. WMATA and industry standards assume that ¼ mile is a reasonable walking distance, and ½ mile represents the outer limit of distance that most persons will choose to walk. Most of the Area 1 development is within ½ mile of the center of either the MIS or final General Plans station location, and could be accessed through the station facilities to the north (as noted above). Conversely, none of Area 2 development is within ¼ mile of either platform location, and only a small portion is within ½ mile. The Project Team utilizes the 1989 WMATA study Development Related Ridership Survey II as a reference for the determination of ridership by development type and distance. It revealed that the walk mode share decreases by 0.76 percent for each 100-foot increase in distance from the station. The additional rail transit trips by walk mode to and from the Area 2 development would, therefore, be negligible due to the prohibitively long walk distance.

The sketch plan and profile submitted with the comments would move a large portion of the platform below grade, increasing construction costs, and increasing the distance from the platform to the mezzanine and pedestrian bridge level, which still must clear the Dulles Greenway below. Since the capital and operating costs of a second station entrance are significant and the additional ridership and revenues negligible, the Project Team declined this suggestion, as it previously did in a coordination meeting with the owner-developer. The economical solution for access from the Area 2 development west of Broad Run should be private shuttle buses, for which the Project Team would provide spaces at the station facilities.

Park-and-Ride Alternatives

The owner-developer in his comments on the Draft EIS and proposed General Plans encouraged the reduction of the 4,750 park-and-ride spaces at Route 606 Station. In the Supplemental Draft EIS, the Project Team proposed, later recommended, and the decision-makers selected a reduction to 2,750 spaces.

In his February 1994 plan and his December 2003 technical report, the owner-developer suggests that the Project Team consider the reduction of capital costs by the use of a surface park-and-ride facility in lieu of a structured one for the Route 606 Station. He also suggests the relocation and reconfiguration of the park-and-ride facilities by using Airport property north and south of the Dulles Greenway and using Area 3 of his ownership..

The Project Team discourages the separation of station facilities, particularly those of moderate size, such as the proposed 2,000-space structure, since a park-and-ride customer of Metrorail would not readily and conveniently reach one facility if the other becomes full first. The Project Team also discourages the separation of the station bus and Kiss & Ride facilities from the Area 1 TREC development, since there can be intermodal transfer and direct connections between the station facilities and the TREC development.

Interchange Modifications

The owner-developer has consistently commented in the two public comment periods and requested in several coordination meetings with the Project Team that the eastbound exit ramp of the interchange between the Dulles Greenway and Route 606 be modified in order to serve the alternative park-and-ride facilities south of the Greenway.

Through its travel demand forecasting and traffic analysis, the Project Team has shown that Project does not necessitate improvements to the interchange between the Dulles Greenway and Route 606. The traffic analysis in support of the Final EIS reveals that the intersection of Route 606 and Route 789 will degrade from Level of Service B in the current year to Level of Service F in the Project's forecast year of 2025, in the No-Build Alternative, that is, without the Project, due to the forecast land use. Level of service at an intersection is measured by the delay in seconds for drivers traversing the intersection. In the opening year of 2015 and in forecast year of 2025, the Full LPA increases the delay. The Project's mitigation for the opening year of 2015 is the addition of a right turn lane from southbound Route 789 to westbound Route 606. As shared with other stakeholders in the Dulles Corridor, the Project Team notes that the traffic conditions of station access should not be a major concern to the County nor to the owner-developer. The peak activity at the station will be early on weekday mornings and the park-and-ride structure will likely be full before the local peak hour of local development. For instance, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m., while the local peak hour would be between 7:30 a.m. and 8:30 a.m.

The suggested modifications of the interchange are not in conformance with A Policy on Geometric Design of Highways and Streets (Green Book) of the American Association of State Highway and Transportation Officials (AASHTO). In particular, the modifications create an interchange between the Dulles Greenway and two crossroads and place a driveway on the eastbound exit ramp. An interchange with two crossroads, in this case, Route 606 and the development roadway, creates complex signing for the exit; moreover, the driver will have unconventional decision-points in a short length of travel. The presence of the ramp toll plaza exacerbates the signing, the line of sight to the decision-points and the inherent weave between the plaza and ramp terminal,

The driveway on the exit ramp violates the denial of access line established for this freeway by the owner of the Dulles Greenway. That denial of access is an integral element for safe and efficient operations of freeways.

While there are other reasons for eliminating this suggestion for modifications, one to add is that the driver, having exited the Dulles Greenway via the eastbound exit ramp and then the development roadway, will not have a clear understanding of the return to the Dulles Greenway. His orientation will be confused, unlike the exactness of the conventional exit maneuver to the primary crossroad, Route 606.

In the formulation of its Team recommendations (February and March 2004), the Project Team concluded, as it did in October and November 2002 Team recommendations, that it could not accommodate the suggested alternatives of the owner-developer.

Following the revising of the LPA and approval of the revised General Plans, the Project Team participated in a May 2004 meeting with the owner-developer, his consultants, and a member of the Commonwealth Transportation Board, MWAA, TRIP II, and Loudoun County. The purpose of the meeting was to review the above issues with all interest parties. The meeting did not result in a change in the selected LPA and approved General Plans.

As stated in the final Team recommendations, the Team will continue to coordinate the pedestrian connections between the station facilities and the proposed development north of Route 606 Station.

Public Comment: Slip ramps from Wiehle Avenue parking should be available for those folks who park at the station to get on the westbound toll road, rather than going back to Wiehle Avenue.(0064 0152-4)

Public Comment: Slip ramps from Wiehle parking should be available for riders to get onto the Dulles toll road rather than going back onto the Wiehle Avenue interchange. If they go through the interchange, that will just screw things up worse.(0064 0072-4)

Response: *Slip ramps for park-and-ride access would be in conflict with ramp access for bus movements to and from the station as shown in the final General Plans. Intersection improvements and other traffic mitigation measures are planned to accommodate the additional traffic volumes using the Wiehle Avenue Station*.

Public Comment: One access [point] provided for the bus stop for Tyco Road may be inadequate due to its close proximity to the Route 7 traffic signal.(0053 0139-1)

Public Comment: We believe HBL's problems could be solved and the transportation scheme improved concomitantly at a reduced cost if the Kiss & Ride bus and parking facility were moved to the south side of Tyco Road and the station access reoriented to the Spring Hill Road intersection to improve pedestrian access. (0070 0138-2)

Public Comment: our review of the supplemental draft EIS states no rationale for locating a Kiss & Ride bus parking facility at the corner of Tyco Road and Route 7, as now proposed. We have found no rationale elsewhere at this point either. (0070 0138-3)

Public Comment: A bus transfer location as proposed on Parcel 55 in northeast quadrant, Route 7, affects the Porsche Audi dealership which is currently zone C-7 and is in a primary location for development or redevelopment as defined in the Fairfax County comprehensive plan in the highway overlay district along Route 7 frontage. (0053 0139-2)

Public Comment: Regarding the Tysons West station specifically, we remain concerned that the proposed pedestrian walkway over Leesburg Pike that begins at the corner of Tyco Road and Leesburg Pike is not accessible to the majority of pedestrians and residents in the area of the station. The more accessible point of access to that station would be the corner of Leesburg Pike and Spring Hill Road. Therefore, although we would advocate two loading points for the station, if only one is to be provided at the outset, the Spring Hill Road end of the station would be preferable.(0034 0126-1)

Public Comment: At the December 11, 2003, public hearing in Ashburn, we were provided copies of alternative schematics for the Tysons West station prepared by the engineering firm Patton, Harris, Rust & Associates (PHRA) for HBL of Tysons. PHRA has concluded that a pedestrian mezzanine and access point is achievable from a technical engineering perspective at the Spring Hill Road end of the station. PHRA's transportation engineer, Mr. Kennedy, also has concluded that locating a walkway over Leesburg Pike from the Spring Hill Road intersection will benefit area pedestrians, improve traffic congestion and enhance development opportunities.(0034 0126-2)

Public Comment: Further, we would suggest that the security, moving and storage facility is available for sale now. We would suggest that you contemplate purchasing that property and use it for your station access and bus access. All with no parking. Why pay $50.00 per square foot and more per land for parking. This makes no sense.(0004 0004-3)

> ***Response:*** *The Project Team recommended, and the decision-makers selected the Option E site plan for the Tysons West station facilities to replace that the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7. In comparison to Options A, B, C and D, Option E was foremost in transit customer convenience and safety and best serves the goals of the Project. Option E will have its access point on Tyco Road at an adequate distance from the Route 7 signalized intersection.*

Public Comment: The development of the Kiss and Ride lot shows a driveway connection to future Colshire Meadows Drive. This [Tysons East] entrance location must be approved by Fairfax County and VDOT with no adverse impacts to the transportation network or stacking.(0123 0158-25)

Public Comment: The Kiss and Ride station at the corner of Colshire Drive/Rt. 123 (dedicated by WEST*GROUP) appears to show a connection to Colshire Meadow Drive and bridge currently under construction and to be completed by October 2004. No such connection is contemplated in our approved PI plan and the grades onsite appear to make such a connection impossible.(0113 0132-16) (0123 0158-18)

> ***Response:*** *The Project Team will continue to coordinate with WEST*GROUP. The Kiss & Ride facility was fully documented in the Draft EIS of June 2002, and no comments were received addressing this issue. If an approved site plan now provides for a grade separated road connection between Colshire Drive and Old Meadow, the access/egress to the Kiss & Ride area would have to be modified during preliminary engineering.*

Bus and Pedestrian Access to Stations

Public Comment: At several of the transit stations, especially the Reston Town Center and Route 772 stations, exclusive busways, light rail systems, or similar methods must eventually supplement a greatly improved pedestrian circulation system in order for these important activity centers to function effectively. (0041 0042-8)

> ***Response:*** *The pedestrian circulation system identified by commenter noted would be the responsibility of local jurisdictions and/or the Commonwealth of Virginia, and would not be part of the Dulles Corridor Rapid Transit Project.*

Public Comment: An essential element of the design of each rail station in the Dulles Corridor is effective access via a well-developed feeder bus system. Each station must be carefully designed to assure that future expansion of feeder bus access can be readily implemented. Kiss and ride drop-off points must fit effectively into this mix. (0041 0042-9)

> ***Response:*** *Bus and Kiss & Ride facilities at each station were designed based on the bus operating plans developed as part of the Draft EIS and mode of arrival data generated as part of*

the ridership forecasts. For Wiehle Avenue Station, the Project Team rearranged the express bus routes to reduce the number of buses turning left from the eastbound exit ramp of the interchange between the Dulles Toll Road and Wiehle Avenue.

Public Comment: The proposed mitigation measures should include parking areas for cabs and drop off and pickup areas for the passengers in the Tysons Corner stations where there are no provisions for kiss and ride lots. If the Project is relying substantially on foot access to the stations, this should be noted. (0091 0106-16)

Response: *The Project Team will continue to coordinate with Fairfax County and VDOT on issues of station access. Due to limitations of available right-of-way, and likely limitations on additional curb cuts at Route 7, the parallel service roads, and Route 123, the Project Team is not proposing any off-street facilities for taxicabs at the Tysons Central 7 and Tysons Central 123 Stations. The Tysons Central 123 Station is served by six bus bays directly adjacent to the station entrances and distributed to either side of Route 123.*

Public Comment: The Tysons East Station is slated to be an aerial facility located at intersection of Scotts Crossing Road/Colshire Drive and Rt. 123. It is imperative that this station be carefully integrated into WEST*GROUP's overall master plan for the area surrounding this station, including
· Addition of Rt. 123 aerial pedestrian crossings
· Elevated connections from the station platform to the Cleveland Building redevelopment site
· Sound mitigation and height "softening"
· Integrate future shuttle bus operations or potential future light rail alternatives (especially "Central Station") to serve areas of Tysons outside the 1600' radii
· Integrate drop-off lanes on the Capital One, southbound side of Rt. 123.(0113 0132-3) (0123 0158-5)

Response: *The Project Team looks forward to receiving WEST*GROUP's master plan. The conceptual layout for this station has not changed since the Draft EIS of June 2002. The project would include one pedestrian bridge crossing Route 123 to serve the south side of the street and the bus and Kiss & Ride facilities. Additional pedestrian bridge connections, provided by others as part of future development, could be accommodated provided that there are no detrimental impacts to the functioning of the station and its facilities, and no additional operational and maintenance costs for WMATA. Sound mitigation and visual impacts of the aerial structures will be addressed as part of the preliminary engineering and final design phase of the project. Issues related to light rail transit alternatives and feeder systems serving Tysons Corner were addressed in the Final Alternatives Analysis Report (May 2001) and the Draft EIS Public Hearing Report (October 2002). Drop off lanes for buses are provided on the north side of Route 123 and on Colshire Drive adjacent to the Kiss & Ride parking area. Kiss & Ride facilities on the Capital One side of Route 123 would need to be offstreet, and would require dedication of additional right-of-way by the property owner for this use.*

Public Comment: The platform for the Tysons East Station should extend northeast approximately 150 feet and cross Scotts Crossing Road allowing elevator/stair tower access at the southwest corner of the Cleveland Site.(0113 0132-13)

Public Comment: North Entrance Pavilion should be shifted to the north by spanning Scotts Crossing Road and building a stair, escalator with aerial walkway and ADA elevator tower to mezzanine level. (0123 0158-22)

Response: *Limitations of the track alignment and profile at this station preclude shifting the station further north; pedestrian access to the entry and the west side of Scotts Crossing would be immediately accessible using the crosswalk.*

Public Comment: The Johnson I and II Building site (Tax Map 30-3-28-6D) is currently under study for rezoning to "with rail" densities upon approval of the FFGA. Interconnections to the Kiss and Ride and perhaps the Tysons East platform itself are possible and should be incorporated into the final design. (0113 0132-15) (0123 0158-17)

Response: *Additional connections, provided by others as part of future development, could be accommodated provided that there are no detrimental impacts to the functioning of the station and its facilities, and no additional operating and maintenance costs for WMATA.*

Public Comment: [Reston Association] further recommends that this Planning Study address design concepts around the station area and recommend guidelines for future development on the Wiehle station site in terms of site design, building design, and landscape and design of public spaces. (0039 0040-9)

Public Comment: [Reston Citizen's Association] further recommends that this planning study address design concepts around the station area and recommend guidelines for future development on the Wiehle station site in terms of site design, building design, and landscape and design of public spaces. (0040 0041-6)

Response*: The final Team recommendations described the team's approach in response to comments on the Wiehle Avenue Station north side station facilities. With the exception of a new roadway connection to Sunset Hills Road, these station facilities would be situated upon the Reston East park-and-ride lot owned by Fairfax County.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for the mixed-use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP. The Supervisor and her committee will conduct special meetings for the community, property owners, and developers to discuss the RFP process, status, and developments to ensure all concerns and issues are identified and addressed accordingly.

Phasing Related to Funding

Public Comment: I strongly support the construction of the full 23-mile rail transit system from Falls Church to Dulles Airport and beyond, even if this requires a phased funding formula to implement. I, as a citizen and homeowner in Fairfax County, am willing to pay my fair share of the cost to complete the full extension of the transit system in the Dulles Corridor.(0041 0042-1)

Public Comment: - [The GRCC supports] A phased approach to construction of the Dulles Rail project, with Phase I ending at the proposed Herndon/Monroe station, where transportation infrastructure is far better able to accommodate the increased needs that will come with rail; ...(0023 0024-5)

Public Comment: I strongly support the construction of the full 23-mile rail-transit system from Falls Church to Dulles Airport and beyond even if this requires a phased-funding formula to implement.(0041 0066-1)

Public Comment: While it would be nice to have it completed in one step, I understand the fiscal constraints that require division and initial construction only out to Wiehle Avenue.(0001 0093-1)

Public Comment: DCRA supports the proposed phased approach for implementing the Dulles rail extension. We emphasize that the Dulles rail extension is a single, 23-mile construction project.(0060 0169-1)

Public Comment: WEST*GROUP endorses the LPA to be constructed in two phases and two separate tax districts. (0123 0158-4)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

First Phase to Wiehle Avenue

Public Comment: - [The GRCC supports] A phased approach to construction of the Dulles Rail project, with Phase I ending at the proposed Herndon/Monroe station, where transportation infrastructure is far better able to accommodate the increased needs that will come with rail; ...(0023 0024-5)

Public Comment: While it would be nice to have it completed in one step, I understand the fiscal constraints that require division and initial construction only out to Wiehle Avenue. (0001 0093-1)

Public Comment: We support the plan phasing of the 23-mile expansion and the first phase ending at Wiehle Avenue. (0060 0134-1)

Public Comment: WEST*GROUP endorses the LPA to be constructed in two phases and two separate tax districts.(0123 0158-4)

Public Comment: We support the plan phasing of the 23-mile expansion and the first phase ending at Wiehle Avenue.(0060 0134-1)

Public Comment: We are pleased to see that the first phase does end at Wiehle, because it does bring it into the corridor, and it will provide a straight shot to Dulles Airport. (0060 0134-2)

Public Comment: We support and are pleased to see that the first phase of the project will end at Wiehle Avenue. This station is a good deal closer to Washington Dulles International Airport than Tysons Corner.(0060 0169-2)

Public Comment: [W]e support rail as the Locally Preferred Alternative but we are here today to support the Phase I plan out to Wiehle Avenue.(0060 0063-1)

Public Comment: I'm very strongly supportive of this application, including the terminus at Wiehle Avenue.(0065 0073-1)

Public Comment: The traffic would be unpleasant during the period that Wiehle is the terminus, but it will be unpleasant during construction and I'd rather endure a mile or two of traffic getting to the Metro than 28 miles of traffic getting into DC. Please don't let a small group of loud activists deter you. It is easier to rile people up to oppose something than it is to support something. Many of my neighbors and colleagues support the Wiehle terminus plan.(0057 0058-2)

> ***Response:*** *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Wiehle Avenue is an Unsuitable Terminus

Public Comment: I join hands with the Reston Association and the Greater Reston Chamber of Commerce in rejecting a plan which temporarily makes Wiehle Avenue the terminal station for the first phase (0020 0021-1)

Public Comment: I agree with the Reston Association and the Greater Reston Chamber of Commerce in rejecting a plan which temporarily make Wiehle Avenue the terminal station for the first phase of Rail to [Dulles.](0021 0022-1)

Public Comment: I am absolutely opposed to the Phase I plan for Rail to Dulles that would make Wiehle Avenue the end of the line, "temporarily." (0035 0036-1)

Public Comment: I'm writing to oppose a temporary metro terminus at Wiehle Ave. This would create an absolutely untenable situation with respect to parking and traffic. (0043 0044-1)

Public Comment: The proposal to phase this project with a stop at Wiehle Avenue will compromise the Reston area and detract from the eventual benefit of the rail. (0042 0043-2)

Public Comment: I am AGAINST this proposed rail system modification. (0098 0114-1)

> ***Response:*** *It is proposed that the full Locally Preferred Alternative (LPA) for the Dulles Corridor Rapid Transit Project be constructed. However, federal funding constraints dictate that it be built in two phases. The first phase, Wiehle Avenue Extension, would extend Metrorail from the existing Orange Line, through Tysons Corner, to Wiehle Avenue. The Wiehle Avenue Station would function as an interim end-of-the-line station. The number of bus bays at the station would be increased, and Kiss & Ride parking may be increased over what was proposed in the Draft EIS. No additional long-term parking beyond that planned for the full LPA would be provided for the interim end-of-line station. The Wiehle Avenue Extension is expected to be complete by 2011. The Extension to Dulles Airport/Route 772 would complete construction of the LPA, extending the line from Wiehle Avenue, through Dulles Airport, to Route 772 in Loudoun County. This phase would include the construction of the new Service and Inspection (S&I) Yard on Dulles Airport property. It is anticipated that this second extension would be complete by 2015.*
>
> *An interim end-of-line station at Wiehle Avenue would allow the initial Dulles Corridor line to provide the maximum benefit possible with the available resources. When the Wiehle Avenue Extension is complete, the initial segment of the Dulles Corridor line would serve approximately 65 percent of the passengers attracted to the full LPA.*

Public Comment: The goal of the Metro is to reduce congestion. It is not to reach Reston. Terminating at Wiehle increases congestion beyond belief. (0074 0084-1)

Public Comment: It would be grossly unfair to that [Wiehle Avenue] community, given the current levels of service there, and, in particular, when you consider that, under the Supplement that we are discussing tonight, it is looking at under the numbers contained in here of 7,400 daily boardings at that location. Obviously, those people have to access that station somehow and we just don't believe that the area around that station is nearly developed to the point that it can accommodate it. (0062 0070-1)

Public Comment: However, I am opposed to a plan that will use Wiehle as its temporary terminus for both land use and traffic planning reasons. There is just not enough land at that spot to serve such a function. Further, the fact that the DAR and toll road is so close to both Sunset/Spring and Sunrise Valley roads already creates a traffic gridlock at Wiehle (and Reston Parkway) crossings of the DAR/toll road. (0120 0154-2)

Public Comment: The idea of stopping the system, even temporarily at Wiehle Avenue is totally absurd! (0094 0110-1)

Public Comment: Bringing rail to Wiehle Avenue and stopping even temporarily is a very bad idea. (0096 0112-1)

Public Comment: Simply put, making Wiehle the end of the line, even temporarily, could lead to major traffic and parking problems for Reston. Never in any of the planning done for rail in the Dulles Corridor was there consideration of ending the line at Wiehle. No land use plan for that scenario was ever developed. (0050 0095-1)

> ***Response:*** *With Wiehle Avenue Station as the interim end-of-line station of the Wiehle Avenue Extension, there will be more bus and Kiss & Ride activity in the morning and evening peak periods than with the Station as an intermediate station. The park-and-ride traffic for the 2,300 space structure would, however, be similar to that when Wiehle Avenue Station is an intermediate*

station along the 23-mile extension of Metrorail. Moreover, the park-and-ride structure will likely be full before the local peak hour of the Reston; in other words, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m. while the local peak hour would be between 7:30 a.m. and 8:30 am. Traffic effects for both the LPA and Wiehle Avenue Extension were conducted in support of the Final EIS. Proposed mitigation measures for anticipated effects have been identified in the Final EIS.

Public Comment: I am raising my objection to using the Wiehle Ave, location for the terminus for the currently designed Dulles Rail project. Although a temporary phase, it will drastically change the status of the Wiehle location aesthetically, in the balance of community resources, and in the efficient flow of people and traffic. The current blend of the amount of parking places, people flow, commercial facilities, and local aesthetic feeling will drastically change for the worst. (0050 0050-1)

Public Comment: I must add my voice to those who object to Wiehle Avenue as the terminus, for Phase I of the Dulles Rail Extension.(0047 0048-1)

Public Comment: Wiehle Avenue is an unsuitable terminus for Phase I. In addition, going to Wiehle Avenue does not appear to be enough to entice the Herndon community to pay. (0044 0045-2)

Public Comment: We have grave concerns with the recommendation to end the first phase of construction at Wiehle Avenue and believe that even a temporary terminus at Wiehle will have a major negative impact on the quality of life of those who live and work in the planned community of Reston. (0039 0040-2)

Public Comment: The idea of a Wiehle terminus is a stop-gap measure, a supposed-better-than-nothing proposal that serves no purpose other than to destroy a viable area not designed for it. (0056 0057-3)

Public Comment: However, building a station and/or making a terminus at Wiehle Avenue is not a good solution. (0105 0123-1)

Public Comment: Phase 1 should terminate no closer in than Dulles Airport. (0046 0047-3)

Public Comment: If we are going to go forward with rail, then let's budget the whole deal. Both portions should be funded. Maybe we should start at both ends and meet at Wiehle-- then, of course, drive in the gold spike. (0045 0046-1)

Public Comment: To terminate this project at Wiehle Avenue will undermine land use policies, both in Loudoun and Fairfax Counties and would forever stunt the economic future of one of the premier development corridors in the United States, we believe that the most pressing issue is the completion of the locally-preferred alternative by 2015. (0114 0133-2)

Public Comment: Regarding point #1, Wiehle Avenue was never planned to be a terminus point. This project is supposed to be "Rail to Dulles" not "Rail to Wiehle". We understand the constraints of federal funding, but the decision to spend the money from West Falls Church to Wiehle with no guarantee that additional funding will materialize creates a host of problems. It creates funding inequities. It will create a parking and traffic nightmare in Reston. It flies in the face of the Comprehensive Plan. It does not achieve the Project objectives. This position has been strongly echoed by the Herndon Council, the Herndon/Dulles Chamber, the Reston Chamber, the Reston Association, major property owners in the corridor, and hundreds if not thousands of (0028 0029-1)

Public Comment: Give service now to all segments of the Corridor and to airport users, to boost ridership and to play fair with the tax district. Include in the contract for rail up the median the spurs that will be needed later. Allow for later express service to the airport. (0012 0012-2)

Public Comment: The Reston Citizens Association supports Rail to Dulles; not Rail to Wiehle; not rail to Herndon- Monroe, but Rail to Dulles and beyond! Given the time it has taken to bring rail to this point,

extension from Wiehle to the airport and Loudoun would be a distant dream. Elected officials who will make irreversible decisions about rail to Wiehle should keep in mind that all the decisions made heretofore, notably the tax district and the land use plans, were based on rail beyond Dulles Airport. (0050 0095-2)

> ***Response:*** *Based on agency coordination, DRPT and WMATA are proposing to construct the Project in two phases. Guidance on federal funding limitations and the timing of local funding availability were considered in determining the proposed phasing. An interim end-of-line station at Wiehle Avenue would allow the initial Dulles Corridor line to provide the maximum benefit possible with the available resources. When the Wiehle Avenue Extension is complete, the initial segment of the Dulles Corridor line would serve approximately 65 percent of the passengers attracted to the full LPA.*

Public Comment: What will be the impact of the station at this location? (0042 0043-3)

> ***Response*****:** *The estimated impacts of the Wiehle Avenue Extension are described in Chapters 3 to 9 of the Final EIS.*

Public Comment: What caused the project to be broken down into two phases? As far as I can tell from the Draft EIS, the decision to divert the metro rail THROUGH Tysons Corner is the primary factor which caused this change. No where in the EIS is the an explanation of why the rail track was diverted through Tysons Corner or a comparison of the cost of keeping the rail line in the Toll Road median strip versus diverting it through Tysons Corner. (0082 0097-1)

Public Comment: I believe that there could be some justification-- I stress "could"-- some justification for extending rail from West Falls Church to Tysons Corner with the terminus being at Spring Hill Road where there's already a Park & Ride lot, not at the Cadillac dealership on Leesburg Pike. (0016 0140-1)

Public Comment: Build rail now up the median to Route 772; Set aside the very expensive and disruptive construction through Tysons for now; and institute good RideOn/TIBS [Tysons Internal Bus System] to serve all of the Tysons area. (0012 0012-1)

Public Comment: The Phase I alternative should be revised with the last stop at Spring Hill Road, not at Wiehle Avenue. (0016 0122-1)

Public Comment: I urge you to reconsider the decision to divert the rail line through Tysons Corner and return it to the median strip straight down the Dulles Toll Road where it was always meant to be. Certainly, Tysons Corner should have a stop (possibly two) along the Dulles toll road just like every other community along that route. However, it should not command 4 stops, or a costly change to the rail route. (0082 0097-2)

> ***Response:*** *Appendix H of the Final EIS (Alternatives Previously Considered), and the Final Alternatives Analysis Report (May 2001), both discuss the Alternative T8 as a Metrorail bypass of Tysons Corner. This alternative, which was suggested during the Project's scoping process, was eliminated from further consideration during the screening of alternatives.*

Public Comment: If Phase I truly has "independent transportation utility," it should be analyzed without reference to Phase II. The fact that Phase II is needed to justify Phase I appears to indicate that, in fact, Phase I does not have independent transportation utility. (0063 0151-6)

> ***Response:*** *Throughout the Final EIS, both the Wiehle Avenue Extension and Full LPA were analyzed as independent projects in the forecast year (2025), compared to the No Build Alternative.*

Other Phase 1 Terminus Should Be Considered

Public Comment: Reston Association urges that every effort be made to expand the first phase to extend to Herndon-Monroe because major parking facilities presently exist at that site, the build of additional parking is more easily accommodated there, and because ramp access into the Herndon-Monroe Park and Ride from the Dulles Toll Road already exists. (0039 0040-4)

Public Comment: Commitments should be made by all decision-making bodies to extend the first phase of construction to Herndon-Monroe as soon as possible. Wiehle Avenue rail service should not be initiated until construction is underway to Herndon-Monroe. (0040 0041-2)

Public Comment: I am writing to register my opposition to the proposal to "temporarily" terminate Phase 1 of the Dulles Rail Project at Wiehle Avenue. I am opposed of several reasons: 1) Herndon-Monroe station has existing facilities that can "relatively" easily accommodate a rail station, while Wiehle Avenue does not. (0046 0047-1)

Public Comment: Also, the ending of Phase [O]ne in Reston Wiehle Avenue will dispute what the DEIS states will have a serious adverse impact on Reston's environment. It will create traffic congestion and a safety problem it will result in additional thousands of vehicles in Reston. They will not only increase pollution, but also they will impact the homes and businesses surrounding the station. At a min solution the station should be moved to Monroe Street. (0033 0034-2)

Public Comment: Phase I should terminate at the point where the line connects to the Dulles Toll Road area. (0044 0045-1)

Public Comment: A Metro line to Tysons certainly makes sense; stop the line there until the system can continue into Loudoun. (0056 0057-2)

Public Comment: I have seen the Herndon-Monroe terminal. That is a beautiful example of planning, ramps coming from the Dulles Toll Road, buses, bus lanes, parking. It is a beautiful place to terminate a line if you have to do it temporarily and that is where the line should terminate. (0074 0084-2)

Public Comment: I am very much in favor of the Dulles rail line, but strongly encourage you to reconsider having one terminus that would essentially serve all of the Reston/Herndon/Sterling area as the project progresses. (0043 0044-2)

Public Comment: It [Wiehle Avenue as a terminus station] creates funding inequities. It will create a parking and traffic nightmare in Reston. It flies in the face of the Comprehensive Plan. It does not achieve the project objectives. This position has been strongly echoed by the Herndon Council, the Herndon Dulles Chamber, the Reston Chamber, the Reston Association, major property owners in the Corridor and hundreds, if not thousands, of citizens. (0028 0064-1)

Public Comment: Why not build the other Reston station off the intersection of Hunter Mill Road and Sunset Hills Road? This area makes much more sense to rezone as a public transportation hub than Wiehle. The Hunter Mill Road/Sunset Hills Road area is: - Off the Toll Road, - There's no lake or other major terrain issues to consider, and - The majority of this large area is currently used as a private golf course, which is much less complex to rezone and build on than Wiehle Avenue. - Still serves the same populations that the Wiehle Avenue site would, plus considers more of the Eastern part of Reston. (0105 0123-5)

> ***Response:*** *Based on agency coordination, DRPT and WMATA are proposing to construct the project in two phases. Guidance on federal funding limitations and the timing of local funding availability were considered in determining the proposed phasing. An interim end-of-line station at Wiehle Avenue would allow the initial Dulles Corridor line to provide the maximum benefit possible with the available resources. When the Wiehle Avenue Extension is complete, the initial segment of the Dulles Corridor line would serve approximately 65 percent of the passengers*

attracted to the full LPA. An extension to Herndon-Monroe Station would add significant costs beyond available funding. A Hunter Mill Road Station was suggested during the Project's scoping process but eliminated from further consideration by the Project Team, as documented in Appendix H of the Final EIS (Alternatives Previously Considered), and the Final Alternatives Analysis Report (May 2001)

Public Comment: Furthermore, any consideration to put the terminus at Wiehle is preposterous. Reston is a major employment center and currently suffers traffic gridlock for most of the day. Creating a Metrorail terminus at Wiehle Avenue would bring all movement on Reston's already crowded roads to a standstill. To compound the insanity of this plan is a proposal to delete structured parking from the Wiehle Avenue terminus. That would just put hundreds of additional parked cars on our residential streets. The Wiehle Avenue park-andride has been Reston's public transit facility and has taken many cars off the roads, including mine. This proposal will put us back in our cars since we will be locked out of public transit in our own community. A Wiehle Avenue terminus cannot absorb outside commuters and still remain available for local use. (0027 0028-3)

***Response*:** *Structured parking is planned for the Wiehle Avenue Station (see Chapter 2 of the Final EIS). In addition, the Wiehle Avenue Extension would include interim express bus service for the western end of the corridor to provide enhanced transit service to travelers who would be served by the Full LPA. The operating plan would consist of service routes that provide connections between every station included in the Full LPA, except Reston Parkway and Route 28, with service frequencies comparable to proposed Metrorail headways. This service, in addition to the structured parking and proposed traffic mitigation measures (e.g., additional lanes) proposed around the station, should ensure roadway operations in the vicinity of the station. Another aspect is that the proposed park-and-ride structure would likely be full before the local peak hour of Reston; in other words, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m. while the local peak hour would be between 7:30 a.m. and 8:30 a.m.*

Commitment to Phase 2 Funding should be Ensured

Public Comment: If the project has to be phased over two federal funding cycles, Virginia should ensure a serious commitment to Phase Two by federal and local authorities or by other means.(0108 0127-1)

Public Comment: Phase One consumes a portion of that right-of-way, and once consumed it will deny the region's future ability to provide that express link between the federal capital and its world gateway if Phase Two was not to be completed in a timely manner. Further, Phase One has been structured to offer maximum "new starts" appeal to the FDA. Such action may weaken the appeal of Phase Two in the federal process. (0108 0127-2)

Public Comment: Consequently, it is vital that: A binding federal or congressional commitment be obtained before the airport's right-of-way is committed to Phase One, or that; The airport be reimbursed for use of its right-of-way until Phase Two is operational. For example, a fee of 40 cents per passenger would provide an incentive for the completion of Phase Two, as well as potentially contributing to its construction cost. (0108 0127-3)

Response: *DRPT has developed the Wiehle Avenue Extension in coordination with WMATA, Fairfax County, Loudoun County, Town of Herndon, and MWAA in response to Federal guidance that the Full LPA was not fundable as single construction project and that a shorter, initial section of the LPA should be developed. Thus, DRPT has chosen to develop the Project in two phases with estimated opening year of the Full LPA in 2015.*

In November 2002, MWAA endorsed the Metrorail Alternative as the Locally Preferred Alternative. In its December 29, 2003 letter for the public hearing record, MWAA has stated that its continued support of the Project is subject to three conditions: 1) The FTA reauthorization process needs to recognize the ultimate goal to complete the rail line out to and beyond Dulles Airport; 2) Advanced additional engineering must proceed beyond the initial segment and include

the entire project; and 3) There needs to be a Memorandum of Understanding among the local partners that captures a joint commitment to see the entire project through to completion.

Public Comment: Revise the DEIS to analyze a first phase of the project that would only serve Tysons Corner. The plan would assume creation of a special tax district only in Tysons Corner to fund the local share of costs. The second phase would include the Dulles corridor and would extend the tax district to include all of the corridor.(0090 0105-1)

Response: *Based on agency coordination, DRPT and WMATA are proposing to construct the project in two phases. Guidance on federal funding limitations and the timing of local funding availability were considered in determining the proposed phasing. An interim end-of-line station at Wiehle Avenue would allow the initial Dulles Corridor line to provide the maximum benefit possible with the available resources. When the Wiehle Avenue Extension is complete, the initial segment of the Dulles Corridor line would serve approximately 65 percent of the passengers attracted to the full LPA. Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share. The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding.*

2.4 Suggestions for Other Alternatives

A. Draft EIS Comments

Public Comments

More Study of Dulles Plan B Alternative

Public Comment: In view of the dismal economics, Dulles Plan B advocates has come up with a range of alternatives that we ask be formally studied in the next revision of the study. (0162, 0162-T-10)

Public Comment: There is no reason we cannot get 120% of the benefits of what is listed in the draft EIS for 20% of the cost. The details are available at DullesPlanB.org. In the month that site has been up, I have had over 300 visitors, and no one has taken issue with either the facts or the conclusions. We are capable of offering more choices to the consumer: public transit, single passenger automobile traffic on the outer lanes, and three versions of private transit: High Occupancy Toll service, car pooling, and formalized just in time ridesharing in the public right of way, a proven concept which has worked so well on I-395. These alternatives can be put into place without invoking special tax districts, without huge annual operating subsidies, while at the same time eliminating full time tolls on the Access Lanes, rather than doubling them. (0162, 0162-T –24)

Response: *In response to the commenter's request, the Project Team had reviewed the range of alternatives proposed on the Dulles Plan B website during the public comment period of the Draft EIS.*

Many of the calculations presented on the Dulles Plan B website, regarding capacity and subsidies, were based on incorrect numbers. The Dulles Plan B proponents indicated several times that the incremental demand for Metrorail over BRT would be approximately 15,000 passengers per day. As was shown in Table 6.3-8 in the Draft EIS, Metrorail was expected to attract 34,000 to 40,000 more total riders per day than BRT (depending on alignment), and approximately 24,000 to 27,000 more new riders.

Dulles Plan B incorrectly stated that the vehicles used for the Transmilenio system in Bogotá, Colombia are 160-seat buses. These vehicles are 60-foot vehicles (like those proposed for the Dulles project) that accommodate approximately 160 passengers (approximately 43 seated and

114 standing). This standee load has been based on an area of 4 persons per square meter, or 2.7 square feet per person—a standard that most riders would find very uncomfortable (at this density contact with other persons is unavoidable). Moreover, the Transportation Research Board's Transit Capacity and Quality of Service Manual (1999) notes that, "High-speed bus service on busways and HOV lanes should not allow standees, so capacity calculations should assume that every passenger may be seated".

The Project Team's analysis relative to Dulles Plan B showed that, while increased use of the HOV lanes could have benefits, the other proposed "private" transit modes were either not feasible, or would not be as beneficial as suggested in Dulles Plan B.

As was shown in Table 6.2-1 of the Draft EIS, projected use of the HOV lanes on the Dulles Toll Road would not have been expected to change from current usage, either under the No-Build or the Build Alternatives, while traffic in the general purpose lanes would have increased, exceeding the capacity of these lanes. If travelers who currently drive alone could be encouraged to rideshare, then it is likely that traffic capacity in the HOV lanes could be increased.

However, there would have been numerous issues associated with incorporating just-in-time ridesharing zones near BRT stations. If the rideshare zones were located along the outer edges of the Dulles Toll Road, they would have likely obstructed interchange ramps, and after picking up passengers drivers would have had to weave across three lanes of traffic to access the HOV lanes because it is not feasible to locate the HOV lanes along the right-hand side of the travel way. In addition, it would have not been possible to add rideshare zones along the Toll Road without expanding the roadway, because the aggregate width of the BRT stations, the six-lane DIAAH, and the Toll Road, including shoulders, uses all of the available right-of-way along the Toll Road. This expansion would have had substantial costs and impacts.

Moreover, due to liability risks, neither the Project Team nor VDOT could have developed facilities with the express purpose of encouraging just-in-time ridesharing. While these agencies recognized the benefits that have been gained in the I-95/I-395 corridor through this informal ridesharing arrangement, the random pairing of drivers and passengers inherent in this form of commuting presents risks that most public agencies are not prepared to assume.

Numerous physical, technological, and social issues may have limited the ability to implement high-occupancy toll lanes in the Dulles Corridor. The analysis also showed that high-occupancy toll lanes might not have had substantial mobility benefits in the corridor. If solo drivers were allowed to use the HOV lane for a fee, then it would have been very likely that a large percentage of the HOV lane users in the Dulles Corridor would be single-occupant vehicles, reducing the average vehicle occupancy in the HOV lane. Therefore, increased use of the HOV lane under a high-occupancy toll system would have resulted in minimal increases in the lane's person-moving capacity, and could result in a reduction in the lane's person-moving capacity.

A detailed response for Dulles Plan B was attached in Appendix F of the Draft EIS Public Hearings Report (October 2002). The response addressed the range of alternatives proposed in Dulles Plan B, as well as several assertions made on the website regarding the costs, capacity, and abilities of bus rapid transit and Metrorail.

More Consideration of Toll Facilities is Needed

Public Comment: We request that the next round report on the effect of transit demand and Toll Road economics of High Occupancy Toll lanes for single-passenger drivers who wish to pay for the use of HOV lanes in peak hours. (0162, 0162-T –15)

Public Comment: We request a next-round report on the effect of transit demand and Toll Road economics of high occupancy toll for single passenger drivers. (0184, 0184-T –12)

Public Comment: At the same time we could also have something called congestion toll, which is happening out in California where people who want to use the express lanes but do not have high occupancy participation in their vehicles pay an additional toll to drive on the express areas. (0252, 0252-T –7)

Response: *The issues associated with implementing a high-occupancy toll system in the Dulles Corridor and the possible benefits of such a system had been explored as part of the Project Team's review of Dulles Plan B during the public comment period of the Draft EIS.*

As the owner and operator of the Dulles Toll Road (and other major HOV facilities in the region), it would be VDOT's responsibility to fully evaluate and implement any proposals that allow travelers driving alone to use the HOV lanes during peak hours for a fee ("value pricing"). Such value pricing systems would require in-depth study. Issues include the lack of space for barrier-separation, technological challenges associated with a non-barrier-separated system, and equity considerations.

The Project Team's analysis relative to Dulles Plan B also showed that high-occupancy toll lanes might not have substantial mobility benefits in the Dulles Corridor. To remain an attractive alternative to the general traffic lanes, the HOV lanes on the Dulles Toll Road should not operate at their maximum level of capacity. If operated at 80 percent of their hourly capacity (a level that provides for congested, but relatively free flowing traffic—see Table 6.1-1 in the Draft EIS), each lane could support 1,920 passenger cars in the peak hour—an increase of only 720 cars over the current and projected use of the HOV lanes in the peak hour (1,200 cars per hour in the peak). With average vehicle occupancy of 2.2 persons per vehicle, the HOV lanes currently support 2,640 persons per lane (2.2 X 1,200) during the peak hour. If realistic vehicle occupancy assumptions were applied for different high-occupancy toll scenarios (approximately 1.5 to 1.6 persons per vehicle if single-occupant vehicles are allowed to use the HOV lane), each lane would support approximately 2,880 persons per hour (1.5 X 1,920) to 3,072 persons per hour (1.6 X 1,920). This volume would only constitute an increase of 200 to 450 persons per hour over the current peak usage of the HOV lanes.

Moreover, it would have been very unlikely that incentives to increase HOV use would have only appealed to people who previously used the general traffic lanes. It would have been much more likely that some of the new HOV users would be persons that would have otherwise used the transit system, reducing the demand for transit in the corridor.

Public Comment: We request the issue of the maximum capacity of the HOV lanes be addressed because we think 4000 passengers per hour can be put on the toll roads, which is the projected transit demand for EIS in Dulles corridor. (0184, 0184-T –13)

Public Comment: We request that the issue of the maximum capacity of the HOV lanes be addressed based on experience with I-95 and I-395, where throughputs of 4,000 passengers per peak hour are being achieved even though half the vehicles are noncompliant. 4,000 passengers per peak hour is higher than the transit demand being projected by the EIS for the Dulles Corridor. (0162, 0162-T –16)

Response: *The maximum capacity of HOV lanes and the projected peak hour demand for Metrorail had been explored as part of the Project Team's review of Dulles Plan B during the public comment period of the Draft EIS.*

For freeway facilities with a free-flow speed of 70 to 75 miles per hour (posted speed 65 miles per hour), the Transportation Research Board's 2000 edition of the Highway Capacity Manual assumes a maximum capacity of 2,400 passenger cars per lane per hour. However, the manual notes that facilities are rarely designed to operate at their maximum capacity, because operations are generally poor at this level of service, and prone to highly variable speeds and backups. Therefore, in order for the HOV lanes to remain an attractive alternative to the general traffic lanes, they should not operate at their maximum level of capacity.

If operated at 80 percent of their hourly capacity (a level that provides for congested, but acceptable traffic flow—see Table 6.1-1 in the Draft EIS), each lane could support 1,920 passenger cars in the peak hour—an increase of only 720 cars over the current and projected use of the HOV lanes in the peak hour (1,200 cars per hour in the peak). With vehicle occupancy of 2.2 persons per vehicle, each HOV lane could support an additional 1,584 persons per hour over the current peak usage of the HOV lane (2,640 persons per lane per hour). Total passenger capacity of the HOV lane in the peak hour would be 4,224 persons (2.2 X 1,920).

Transportation systems must be designed to support the demand expected during the "peak of the peak," even though this may result in under-utilization of capacity for the rest of the peak period. For the LPA's Alignment T6, this "peak of the peak" demand requires that the system have enough capacity to support 7,540 passengers in the peak direction, in the peak hour for operations in the corridor; the Metrorail Alternative provides a capacity of 9,600 passengers per hour in the peak direction. The peak demand for Metrorail is much higher than the capacity provided by the HOV lane in the peak direction.

Consider "Just In Time" Carpooling

Public Comment: We request the study of Just in Time ridesharing zones to be placed near the pedestrian overpasses, and a forecast of the increase in passenger capacity from the HOV lanes from this step. Dulles Plan B projections are that the public/private transit mix on the Corridor can approach 50/50 and that rail will never be needed. (0162, 0162-T –17)

Public Comment: We request a study of just-in-time ridesharing zones be placed nearer the pedestrian overpasses because we think that a mix of public-private transit can approach 50-50 and that rail will never be needed. (0184, 0184-T –14)

Public Comment: One of the things we think would be a better idea is the BRT, along with some other plans that we might want to look at, and that is at the same time providing the BRT, a switch to subsidized transit, along with private unsubsidized transit. In other words, at BRT stations and other stations that link to the BRT, have what we call just-in-time ridership areas, where vehicles who only have one individual in them can pull up into the station area and take on additional riders. (0252, 0252-T –6)

Response: *BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The issues associated with implementing just-in-time ridesharing zones in the Dulles Corridor and the possible benefits of increased HOV use in combination with BRT had been explored as part of the Project Team's review of Dulles Plan B during the comment period of the Draft EIS.

Neither the Project Team nor VDOT could develop facilities with the express purpose of encouraging just-in-time ridesharing (also known as "slugging" or casual carpooling) because of the tremendous liability risk associated with such activities. While these agencies recognize the benefits that have been gained in the I-95/I-395 corridor through this informal ridesharing arrangement, the random pairing of drivers and passengers inherent in this form of commuting presents risks that most public agencies are not prepared to assume.

Moreover, there would be numerous issues associated with incorporating just-in-time ridesharing zones near BRT stations. Zones could either be accessed from the DIAAH or from the Dulles Toll Road. It would not be practical to access rideshare zones from the DIAAH, because the roadway is currently restricted to airport-only traffic. If additional access points were provided for HOV drivers, it would be difficult to enforce use of the roadway. If the zones were located along the HOV lane at the inner edges of the Dulles Toll Road, they would require a left-hand merge and diverge maneuver. The American Association of State Highway and Transportation Officials (AASHTO) discourages designs that require left-hand merge and diverge maneuvers, and in this

case such maneuvers would need to be performed by private vehicles at frequent intervals. If the rideshare zones were located along the outer edges of the Dulles Toll Road, they would likely obstruct interchange ramps, and after picking up passengers drivers would have to weave across three lanes of traffic to access the HOV lanes because it is not feasible to locate the HOV lanes along the right-hand side of the travel way. In addition, it would have not been possible to add rideshare zones along the Toll Road without expanding the roadway, because the aggregate width of the BRT stations, the six-lane DIAAH, and the Toll Road, including shoulders, uses all of the available right-of-way along the Toll Road. This expansion would have had substantial costs and impacts.

The Project Team's analysis relative to Dulles Plan B also showed that increasing use of the HOV lanes would have not dramatically increase the person-moving capacity of the corridor. For freeway facilities with a free-flow speed of 70 to 75 miles per hour (posted speed 65 miles per hour), the Transportation Research Board's 2000 edition of the Highway Capacity Manual *assumes a maximum capacity of 2,400 passenger cars per lane per hour. However, the manual notes that facilities are rarely designed to operate at their maximum capacity, because operations are generally poor at this level of service, and prone to highly variable speeds and backups. Therefore, in order for the HOV lanes to remain an attractive alternative to the general traffic lanes, they should not operate at their maximum level of capacity.*

If operated at 80 percent of their hourly capacity (a level that provides for congested, but acceptable traffic flow—see Table 6.1-1 in the Draft EIS), each lane could support 1,920 passenger cars in the peak hour—an increase of only 720 cars over the current and projected use of the HOV lanes in the peak hour (1,200 cars in the peak hour for all alternatives—see Table 6.2-1). With vehicle occupancy of 2.2 persons per vehicle, each HOV lane could support an additional 1,584 persons per hour over the current peak usage of the HOV lane (2,640 persons per lane per hour). Total passenger capacity of the HOV lane in the peak hour would be 4,224 persons (2.2 X 1,920).

To determine whether the maximum person-moving capacity provided by the combination of BRT and increased HOV use would meet the demand projected for Metrorail, it is necessary to know the maximum passenger load forecast for the peak hour. Transportation systems must be designed to support the demand expected during the "peak of the peak," even though this may result in under-utilization of capacity for the rest of the peak period. For LPA Alignment T6, this "peak of the peak" demand requires that the system have enough capacity to support 7,540 passengers in the peak direction, in the peak hour for operations in the corridor; the Metrorail Alternative provides a capacity of 9,600 passengers per hour in the peak direction.

The Project Team's analysis relative to Dulles Plan B showed that the BRT Alternative with increased vehicle capacity, when combined with increased use of the high-occupancy lanes on the Dulles Toll Road, did have the physical capacity to support the peak demand projected for the Metrorail Alternative, though it was not a 50/50 split between capacity provided by BRT and increased capacity provided by the HOV lane.

However, capacity would not have been what truly limited the ability of BRT in the Dulles Corridor to serve the same level of demand as Metrorail. BRT would not have had the same "drawing power" as Metrorail because of a combination of other factors:

- *BRT forces travelers bound for Arlington and the Core to transfer at the Orange Line (or at Tysons West for BRT/Metrorail).*

- *BRT does not provide a direct connection to Tysons Corner. It requires travelers to transfer to another feeder system before reaching their final destination in Tysons Corner.*

However, the BRT operating plans did include capacity enhancements needed to meet the anticipated demand for BRT, such as bus platooning, and 'express' service patterns that do not stop at each station.

Dulles Airport Station Access

Public Comment: If you're on a rail and you're traveling to National Airport, check it out. The station is still quite distant from the airline that you want to get to. And you get off and you carry your heavy luggage on a hot day like this some distance to the airline. BRT, because it is a bus-based system, can deliver you, with customized routing, directly to the door of your airline. And, in fact, if you liberate yourself from the confines of the EIS, you can see that with BRT, you can customize routes so you don't have to go to West Falls Church, you can get on at Reston and go straight to 12th and Penn or straight to the Pentagon, and you start to create a regional rapid transit potential. Because this is so much cheaper, you can have many more miles of routes. You can reach out to many more places. (0138, 0169-T –6)

Response: *BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Issues relating to the stop location at Dulles Airport had been explored as part of the Project Team's review of Dulles Plan B during the comment period of the Draft EIS.

As had been proposed, neither BRT nor Metrorail provided direct access to the arrival and departure levels at Dulles Airport. Both would have connected to the terminal face along the existing Commercial Roadway. The BRT stop would have been immediately adjacent to the face of the terminal, while the center of the Metrorail platform is approximately 193 feet from the face of the terminal to preserve MWAA's ability to construct its automated people mover system.

Support Plan B

Public Comment: I find after listening to tonight's talk that I support plan B, the Dulles plan B, the bus rapid transit. I support paying for the toll road, paying it off, paying the debt and freeing it, as we promised we would. And I'm American and I support our process. (0191, 0191-T –7)

Response: *Your participation in the public meetings and opinion as to which alternatives or alignments you think would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in the selection of the Locally Preferred Alternative). BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Support Express Bus Services

Public Comment: As a Kings Park resident, I can extol the virtues of I-395 express buses that whisk me and my neighbors door to door non-stop to the Pentagon metrorail. In contrast to suburban metrorail parking garages, express buses make reduced car ownership possible, eliminate a time-consuming and disruptive mode transfer from car to rail, and reduce environmentally unfriendly impervious surface area. In short, I advocate for Herndon, Reston and Loudoun residents what Kings Park residents enjoy, which are express buses. And let me repeat, that's existing express buses, decidedly not BRT, which force time-consuming, disruptive mode transfers and park-and-rides. (0134, 0134-T –8)

Response: *Express bus service currently exists in the corridor and has been included as part of the No-Build Alternative. The Draft EIS and Final EIS compares the beneficial and adverse effects of providing a higher level of transit service in the corridor than the express service of the No-Build Alternative.*

Interface with Route 28 Light Rail

Public Comment: THE ISSUE OF INTERFACING DULLES RAIL WITH ROUTE 28 LIGHT RAIL SHOULD BE DEVELOPED. The DEIS discusses light rail on Route 28 (without mentioning the provision in the Fairfax County Plan), but does not attempt any accommodation between Dulles Rail and light rail since no state studies have been completed that identify station locations. That is a superficial response for such an important issue, and the FEIS should make key assumptions based on known facts that would result in a compatible interface with a future light rail system. VDRPT has published conceptual drawings and a brochure about light rail in the Route 28 corridor that the FEIS could consider. One basic issue is surface or elevated light rail system on Route 28 in the vicinity of the Route 28 Metro station. (0197, 0197-M –3)

> ***Response:*** *The potential for connections to a future Light Rail Transit system on Route 28 have been considered in the development of the Full LPA. The design of the Route 28 Station does not preclude future connectivity to a Light Rail Transit system on Route 28. However, under the requirements of NEPA, the evaluation of the Full LPA must consider the impact of other projects that are reasonably foreseeable. Since Light Rail on Route 28 is only in the very early planning stages and has not been studied in detail, nor is it on the regionally adopted Constrained Long Range Plan at this time, no definitive alignment has been established for the transit improvement.*

Further Extensions of Rapid Transit and Roadways

Public Comment: I urge the WMATA and VA Transportation boards to make provisions/allowances for an eventual extension of the rapid transit line from the West Falls Church Station down Route 7 to Seven Corners, Bailey's Crossroads, and Skyline (with a possible extension). This area cries for a rapid transit system, and it would make good sense to serve these high-density areas with their large shopping centers, as well as providing a connection with the Orange Line into the District. (0004, 0004-L –3)

Public Comment: I support BRT in the Dulles Corridor as well as along I-66 from the Vienna Metro out to Haymarket with corresponding BRT stations at Route 123, Fair Oaks, Fairfax Pkwy, Route 28, Compton Rd, Route 234 Business, Route 234, PW Pkwy, Route 29, and finally Route 15. Furthermore, this I-66 line and the Dulles line should intersect BRT lines that operate along the Beltway, Fairfax Parkway, Route 28 and the PW Parkway in dedicated HOV lanes. Where these concentric lines intersect VRE, there should be major stations to facilitate intermodal transfers. In time, select BRT lines could be upgraded to light rail as needed. (0408, 0408-E –1)

Public Comment: Regarding the transportation for Metro, I think the Metro should come all the way to Leesburg, and I think that consideration should be given for future extension of Metro Leesburg West, because you are growing, we're not shrinking, and there's a need even west of Leesburg at this time. Definitely, it should come to Leesburg. (0419, 0419-T – 1)

Public Comment: This county has the density of an urban area with the transportation infrastructure of lightly developed suburban area. We need an urban style transportation network with multiple modes of transportation, through and local routes, primary, secondary, and tertiary roads, and logical connecting nodes. (0007, 0007-E –3)

Public Comment: Virginia seems to be asleep at the wheel when it comes to mass transit of any kind. How can you explain to commuters why we are still paying tolls on the Dulles Toll Road? How come Virginia could not expand the Dulles Toll Road but a private partnership could? Why hasn't the Metrorail (Orange Line) on I-66 ever moved one inch since it was completed? Why do they continue to build additional parking garages at the Vienna stop instead of adding more rails? Don't you wonder where all these cars are coming from? (0123, 0123-L –2)

Public Comment: Instead of adding more HOV's and continue the bottomless pit at the Springfield interchange, why didn't Virginia take these funds and expand Metrorail from Vienna to at least Front Royal? Why isn't there a transit system down Dulles Toll Road? Why has nothing been developed down

Route 7 from Leesburg to the Tyson Corners area? Why is there no transit system down Route 28 from Route 7 to Manassas? Can you explain why the only ideas Virginia can seem to come up with for transportation is more HOV's, Toll lanes, and larger interchanges? These are all fruitless and way outdated even before they have been completed. Why is there not a partnership between Virginia and corporations to insure that the transit systems are in place and the commuters can reach their place of employment in a timely manner? The states need to provide some kind of incentive to the corporations in order to receive funds to assist in the building of mass transit. (0123, 0123-L –3)

Public Comment: And so I truly hope that, from my perspective, what would benefit this area would be, number one, extend Metrorail all the way fully to Dulles Airport, as part of a unified Metro system. Once that has fully occurred, then I believe we can look at extending, for example, the Route 28 roadway in Loudoun County, across the Potomac River, through Montgomery County. I realize there may be some opposition in Montgomery County, but that could be performed as a limited access highway, for example. That would, in turn, take, I believe, a great deal of pressure off of the Beltway for some time. (0036, 0275-T –2)

Public Comment: And I believe once we have extended Metrorail and the Leather Bridge crossing, that that would be the appropriate time, for example, to consider widening the Beltway. But I don't believe- I'm certainly all for planning, but I don't believe we should move forward with concepts of widening the Beltway and more highways at this time. (0036, 0275-T –3)

Public Comment: How, where and when various corridor and transit modes and strategies best fit into the region's transportation system in the next 25 years isn't clear. A full 24-mile extension, rail extension to eastern Loudoun, may be viable in 2025. Is it needed by 2010? Do better investments exist in the interim? The DEIS doesn't tell us. (0446, 0146-T –4)

Public Comment: Meanwhile the public money saved can go toward expanding the beltway, making Rt. 7 a freeway from Tyson's Corner to Leesburg, and finally turning Rt. 28 into a full freeway. (0299, 0299-E –4)

Public Comment: Many commuters are from MD. How long before rail is available along the beltway to service them & reduce such congestion. (0049, 0049-CC-3)

Public Comment: At such time as the technology and economic feasibility of internal, short haul people mover systems develops, there may be opportunities to implement such systems to serve the rail transit stations in the most intensely developed urban activity centers. (0088, 0211-M –13)

Public Comment: I would also like to voice my support of any future plans to build a Metro station at Centreville Road off I-66 (or, alternately, a station in Manassas), which will alleviate the congestion going into the Vienna Metro station. (0229, 0229-E –2)

Public Comment: Second, extend route 28 in Loudoun County over the Potomac to route 270. Only then, should serious consideration be given to widening the beltway (I495). (0036, 0036-CC-2)

Public Comment: If we had considered a right of way for rail on Route 28 15 years ago, and that was a potential possibility now, perhaps we'd be talking to Maryland about a rail alignment along a potential techway alignment that would link two entities, it would link by rail, and I think would be very favorable for many politicians in Maryland and Virginia as well. (0242, 0242-T –2)

Public Comment: In Mount Vernon, the Citizens Council voted unanimously last fall for an Elevated Monorail from the Beltway to Fort Belvoir. The cost will be much lower than for a Metro line, and it does not involve the loss of two highway lanes. Traffic congestion along Northern Virginia highways warrants prompt action with a program that will be effective. The VDOT plan to widen Richmond Highway to 8 lanes is not acceptable. It will cost billions, take several years to complete, and cause a loss of property for many businesses already suffering with shallow lots. An Elevated Monorail to connect from the Beltway to the new National Army Museum at Fort Belvoir will be good start on a transportation program

that will be paid for almost entirely by the commuters that use it, not by other taxpayers. (0271, 0271-L – 1)

> ***Response:*** *The Project Team considered rapid transit improvements within the Dulles Corridor as documented in Appendix H of the Final EIS and in the Final Alternatives Analysis Report (May 2001). Alignments outside the Dulles Corridor have been beyond the scope of the study. Other transportation improvements (both highway and transit) outside the Dulles Corridor are recommended in the Northern Virginia 2020 Plan, Statewide Transportation Plan, and local comprehensive plans and are being pursued by VDOT, DRPT, and others. This program of improvements has been intended to increase mobility and address the existing and potential future deficiencies in Northern Virginia.*

Purpose and Need for Transit Improvements

Public Comment: How, where and when various corridor transit modes and strategies best fit into the region's transportation system in the next 25 years isn't clear. A full 24-mile rail extension to eastern Loudoun County may be viable by 2025. Is it needed by 2010? Do better investments exist in the interim? The DEIS doesn't tell us. (0446, 0218-M –3)

> ***Response****: Chapter 1 of the Final EIS describes the purpose and need for the Full LPA and the Wiehle Avenue Extension in the Dulles Corridor. The data presented in Chapter 6 of the Final EIS documents that transit improvements are needed in the corridor.*

Need for an Integrated System

Public Comment: Our local governments have already taken many steps and all concerned need to work carefully to maximize the possibilities and encourage future growth in transit ridership beyond the projections outlined by using innovative development approaches in these areas and also by creating an integrated system that involves feeder bus lines, kiss-and-rides, pedestrians, bike paths, and some of the other things that are going on here and elsewhere in the country. (0244, 0244-T –5)

> ***Response:*** *The Project Team agrees. These measures are discussed throughout the Final EIS and are recognized by the two counties, VDOT and DRPT.*

Consider Innovative Technologies

Public Comment: Concerned that the build alternatives discount cutting edge technology (Maglev) as not practical. Proposes that there should be two systems in the corridor—an express MagLev system serving Tysons, Arlington, and Union Station and another system with a loop around Tysons and a station common with the East or West Falls Church. This system would provide express service to Dulles Airport and local service to the Reston, Herndon, and Tysons Corner areas. Using this technology would expand the area's reputation. Supports MagLev over heavy rail as the best option for rail in the so-called high-tech corridor. (0495 2-01)

> ***Response:*** *As a proven technology via the German Transrapid system, Maglev (or magnetic levitation) is an inappropriate technology given the short distances between the corridor activity centers. Maglev is operated by non-contact electromagnetic systems that actually lift, guide, and propel the vehicle forward at speeds up to 300 miles per hour. This technology is usually used for long distances and offers an alternative for travelers between large urban areas of up to 600 miles. It also serves as a substitute for short-haul air trips. In order to reach the maximum operating speeds, the Maglev technology requires large distances between stations and/or stops. Maglev is not considered a feasible technology for this project since there are short distances between stations, consequently the true benefits of Maglev would never be realized in the corridor. There is a Federal initiative for urban maglev technology, but the systems are in the research and development stage.*

Need for Other Regional Improvements

Public Comment: And I believe once we have extended Metrorail and the Leather Bridge crossing, that that would be the appropriate time, for example, to consider widening the Beltway. But I don't believe- I'm certainly all for planning, but I don't believe we should move forward with concepts of widening the Beltway and more highways at this time. (0036, 0275-T –3)

Public Comment: And so I truly hope that, from my perspective, what would benefit this area would be, number one, extend Metrorail all the way fully to Dulles Airport, as part of a unified Metro system. Once that has fully occurred, then I believe we can look at extending, for example, the Route 28 roadway in Loudoun County, across the Potomac River, through Montgomery County. I realize there may be some opposition in Montgomery County, but that could be performed as a limited access highway, for example. That would, in turn, take, I believe, a great deal of pressure off of the Beltway for some time. (0036, 0275-T –2)

Public Comment: Second, extend route 28 in Loudoun County over the Potomac to route 270. Only then, should serious consideration be given to widening the beltway (I495). (0036, 0036-CC-2)

> ***Response****: The Project Team considered rapid transit improvements within the Dulles Corridor as documented in Appendix H of the Final EIS and in the Final Alternatives Analysis Report (May 2001). Alignments outside the Dulles Corridor have been beyond the scope of the study. Other transportation improvements (both highway and transit) outside the Dulles Corridor are recommended in the Northern Virginia 2020 Plan, Statewide Transportation Plan, and local comprehensive plans and are being pursued by VDOT, DRPT, and others. This program of improvements has been intended to increase mobility and address the existing and potential future deficiencies in Northern Virginia.*

B. Supplemental Draft EIS Comments

State Agency Comments

Alternatives Should Not Preclude an Eventual Integrated System

State Comment: The document should ensure that any of the Dulles Corridor Rapid Transit stations proposed in Tyson's Corner or at Dunn Loring on the Orange Line will not preclude a future integration of the regional system. It would be desirable that the Supplemental Draft Environmental Impact Statement addresses how a future Beltway rapid transit system could connect to the Dulles system including passenger transfers, station platforms, and vehicle layover. Right-of-way should be preserved at the proposed Dulles Corridor Rapid Transit Stations to accommodate the future Beltway Corridor system. (0079 0092-1)

> ***Response:*** *Montgomery County has clarified its request that the Dulles Corridor Rapid Transit Project recognize to the extent possible the interface between the Project and a future Beltway rapid transit system. In response, the Project Team has inserted a figure in Chapter 1 of the Final EIS to serve as a reminder and starting point for future planning.*

General Bus Improvements

State Comment: "…the movement from the toll road ramp to Wiehle Ave approach is difficult." Please investigate bus routing plans that will reduce the impacts on the toll road ramps. An alternative to alleviate traffic congestion associated with the end of the line station for Phase 1 could be to build a direct access ramp to the station to route traffic from the eastbound toll road off-ramp to the station. (0091 0106-12)

> ***Response:*** *Based on the results of the Supplemental Draft EIS, the Project Team examined additional measures to limit the impact of the bus movement between the Dulles Toll Road and the Wiehle Avenue Station northside facilities.*

- *New left-turn lane northbound on Wiehle Avenue;*
- *New left-turn lane to the eastbound Dulles Toll Road exit ramp;*
- *New entry for bus ingress to the northside station facilities from the westbound DTR entry ramp;*
- *New acceleration lane for bus egress from the northside station facilities to the westbound DTR;*
- *Widening of Sunset Hills Road between Wiehle Avenue and Isaac Newton Square and provide new left-turn lane; and*
- *Improvements to private roadway south of Sunset Hills Road to VDOT standards;*
- *Addition of bus bays on eastbound DTR exit ramp; and*
- *Rearrangement of express bus routes to reduce the number of buses turning left from the eastbound DTR exit ramp.*
- *Incorporation of a bus-only exit and entry driveways on the westbound entry ramp to serve the northside facilities*

A direct access ramp into the station was not considered because it was not deemed cost-effective for a station that would be an interim terminus.

Regional Agency Comments

Consider Premium Bus Service

Regional Comment: The Airports Authority supports the concept of Premium Bus Service as an interim measure that would provide non-stop service on 15-minute headways between the Wiehle Avenue Station and the Main Terminal, Washington Dulles International Airport. (0131 0166-2)

Response: *The service structure noted in the comment reflects the proposed service structure identified in the Final EIS.*

Local Agency Comments

Feeder Bus Consideration

Local Comment: Table 6.1-4 FCDOT commented on the DEIS that during peak periods, Connector bus service would have no greater than 30 minute headways. (0093 0109-2)

Response: *A small number of Fairfax Connector services in the corridor will have service frequencies greater than 30 minutes, though the predominant majority of the services will have frequencies at 30 minutes or below.*

Public Comments

Suggested Alternative Tysons West Station Locations

Public Comment: One thing I do notice on a daily basis is the Security Storage building that sits between the Tysons' Toyota dealership and the new Porche / Audi dealership…It's been up for lease for months...Not sure if it fits into the plans, but it really wouldn't been affecting too many people now. (0159, 2-02)

Response: *A station facility at the site of the Security Storage building is distant from the station. The site had been proposed as the location for a major intermodal facility for the Metrorail/Bus Rapid Transit alternatives and a 2,000-space park-and-ride structure. When Metrorail was selected as the Locally Preferred Alternative, the need for the intermodal facility was eliminated. At that time, the Project Team also recommended a reduction in the amount of parking at this station to reduce anticipated traffic effects.*

Consider Premium Bus Service

Public Comment: The DEIS calls for "premium bus service" to minimize traffic and parking requirements at Wiehle. The primary parking area for this is to be Herndon/Monroe. Unlike current express bus services, these "premium buses" will not be able to use the un-congested middle lanes of the Dulles Airport Access Road, but must contend with inherent delays from peak hour traffic either on the Toll Lanes so they can exit at Wiehle or on local roads also filled with peak hour traffic. Do you really think people will drive to Herndon/Monroe only to board a bus so they can sit in rush hour traffic on the way to Wiehle? Won't it be faster to just take one of the existing express buses or avoid the bus altogether and drive straight to Wiehle? Under any circumstances, can being stuck in peak hour traffic be called "premium bus service"? (0038 0039-4)

Response: *The Corridor express bus service, formerly referred to as 'premium bus', would be designed to replicate service provided by the rail system west of Wiehle Avenue to the greatest degree possible. Given this, passengers would board the express bus service at each of the express bus stops in the corridor, including Route 772, Route 606 (Dulles North Transit Center), Dulles Airport, and Herndon-Monroe. Wiehle Avenue would be a major parking facility but there is space and planning constraints that limit the amount of parking that can occur there. The express bus service from Herndon-Monroe is envisioned as having a very high frequency shuttle to Wiehle Avenue for those drivers who would not be able to find a parking space at Wiehle Avenue. The intent is to make Herndon-Monroe a viable satellite facility through the provision of a very convenient shuttle service providing direct service into Wiehle Avenue. To support express bus, including this shuttle service, the following improvements at Wiehle Avenue Station and environs would be incorporated:*

- *New left-turn lane northbound on Wiehle Avenue;*
- *New left-turn lane to the eastbound Dulles Toll Road exit ramp;*
- *New entry for bus ingress to the northside station facilities from the westbound DTR entry ramp;*
- *New acceleration lane for bus egress from the northside station facilities to the westbound DTR;*
- *Widening of Sunset Hills Road between Wiehle Avenue and Isaac Newton Square and provide new left-turn lane; and*
- *Improvements to private roadway south of Sunset Hills Road to VDOT standards;*
- *Addition of bus bays on eastbound DTR exit ramp; and*
- *Rearrangement of express bus routes to reduce the number of buses turning left from the eastbound DTR exit ramp.*

Public Comment: Unlike the current express-bus service, these premium buses would not be able to use the uncongested middle lanes on the Dulles Airport Access Road but must contend with the inherent delays from peak-hour traffic either on the toll lanes so that they can exit at Wiehle Avenue or on local roads that would also be filled with peak-hour traffic. I don't think we can really expect people to drive to Herndon-Monroe, then board a bus only so they can sit in some traffic during rush hour on the way to Wiehle. I suspect that it will be a lot faster for them to take existing express buses directly to their destination or avoid buses altogether and drive straight to Wiehle. (0038 0088-1)

Response: *Corridor express bus service, formerly referred to as 'premium bus', will use the right lane of the Dulles Toll Road in order to access the Wiehle Avenue Station from the Herndon-Monroe stop. To support express bus, including this shuttle service, the following improvements at Wiehle Avenue Station and environs would be incorporated:*

- *New left-turn lane northbound on Wiehle Avenue;*
- *New left-turn lane to the eastbound Dulles Toll Road exit ramp;*
- *New entry for bus ingress to the northside station facilities from the westbound DTR entry ramp;*
- *New acceleration lane for bus egress from the northside station facilities to the westbound DTR;*
- *Widening of Sunset Hills Road between Wiehle Avenue and Isaac Newton Square and provide new left-turn lane; and*
- *Improvements to private roadway south of Sunset Hills Road to VDOT standards;*

- *Addition of bus bays on eastbound DTR exit ramp; and*
- *Rearrangement of express bus routes to reduce the number of buses turning left from the eastbound DTR exit ramp.*

With regard to Herndon-Monroe, Wiehle Avenue will be a major parking facility but there are space constraints that limit the amount of parking that can occur there. The express bus service from Herndon- Monroe to Wiehle has been designed to be a very high frequency shuttle to Wiehle Avenue for those drivers who will not be able to find a parking space at Wiehle Avenue. The intent is to make Herndon-Monroe a viable satellite facility through the provision of a very convenient shuttle service providing direct service into Wiehle Avenue.

Public Comment: Where is the funding for this so called premium bus service coming from? Who will pay for this? (0038 0039-5)

Public Comment: I think there is also some question about where the funding for premium bus service would come from. (0038 0088-2)

Public Comment: This document is based on the ridership estimates. These ridership estimates come from the fact that there will be a premium shuttlebus service, yet nobody knows where the funding for that will come. (0062 0070-2)

Public Comment: The ridership projections appear to be pegged to the provision of a "premium bus" service. Who will provide that service, and how will it be paid for? (0063 0151-14)

Public Comment: What is the funding source for the premium bus service? (0107 0125-7)

Response: *The Corridor express bus service, formerly referred to as 'premium bus', would be the continuation of the existing bus services in the corridor operated by Loudoun and Fairfax counties. Capital costs for the express bus service are not included in the Project's capital cost estimate. Operating funding would rely on existing sources.*

Public Comment: The SDEIS invokes the concept of a premium bus service from the west to Wiehle Avenue. Detail what this service is—where it starts, how it avoids congestion, and what routes it is designed to replace. Will this premium service be in addition to, or in place of, current service? (0061 0117-19)

Response: *The Corridor express bus service, formerly referred to as 'premium bus', is a high quality service meant to replicate rail service to the greatest degree possible until rail is extended to Loudoun County in the second phase of the project. The service would mimic rail in terms of service to station areas served by rail (Route 772, Route 606, Dulles Airport, Herndon-Monroe, Reston Town Center, and Wiehle Avenue) service frequency, hours of service, and the fact that there would be high quality service in the reverse peak direction. The Corridor express bus service will not replace express service currently run by Loudoun County into Rosslyn and downtown Washington. No other service would be replaced.*

Public Comment: What is premium bus service? How many buses will be part of the premium bus service package? When will it be in full operation? (0107 0125-4)

Response: *Corridor express bus service, formerly referred to as 'premium bus', is a high quality bus service that is meant to replicate rail to the greatest degree possible until rail is extended to Loudoun County in the second phase of the project. The service would replicate rail in terms of service of areas served by rail, service frequency, hours of service, and the fact that there would be high quality service in the reverse peak direction. Service would run from existing Park-and-Ride lots. All service would run to Wiehle Avenue, with the exception of Loudoun County express bus service into Rosslyn and downtown Washington. The opening year of the service would be 2011 when the Wiehle Avenue Extension opens. The express bus service would require 22 buses to operate all proposed routes.*

Public Comment: What routes will be premium bus service take? The corridor? The minor arterials such as neighborhood streets? (0107 0125-5)

> ***Response:*** *Corridor express bus service, formerly referred to as 'premium bus', would run predominantly in the Dulles Greenway and the Dulles Toll Road. The services would run briefly on local streets to access the Greenway and the Dulles Toll Road from Park-and-Ride lots located near the Greenway or the Toll Road, and would also use local streets to access the Wiehle Avenue Station.*

Public Comment: What are the capital and operating cost of the premium bus service? (0107 0125-6)

> ***Response:*** *The incremental annual operating costs of corridor bus service in 2025 for the Wiehle Avenue Extension can be calculated from Table 6.1-13 of the Final EIS. For Fairfax County, the annual operating costs increase by $4.2 million in current 2004 dollars. For Loudoun County, the costs increase by $2 million in current 2004 dollars. Capital costs for express bus are associated predominantly with the purchase of new vehicles for the service and are approximately $43 million in year of expenditure dollars.*

Public Comment: How is the premium bus service different from the BRT alternative? How does it differ from a feeder bus system? (0107 0125-8)

> ***Response:*** *Corridor express bus service, formerly referred to as 'premium bus', would be similar to the BRT Alternative evaluated in the Draft EIS in that it would run at high frequency, use high capacity buses, would provide service not only in the peak direction but also in the off-peak direction, and would run during the same hours as Metrorail. The primary difference is that the BRT Alternative assumed rail-like stations in the median of the Dulles International Airport Access Highway. The Corridor express bus service would run in the Greenway and the right-lane of the Dulles Toll Road in order to be able to exit at Wiehle Avenue. In addition, the express bus stops would be 'off-line' meaning they would be located at existing or new park-and-ride facilities, with service accessing the Greenway and the Dulles Toll Road from these stops via local streets. Feeder buses are local services that pick up at multiple stops and then feed into a rail station. The express bus routes will feed into the Wiehle Avenue Station, but they are express services making a very limited number of stops before running to Wiehle Avenue.*

Public Comment: Is this the Premium Bus Service that is identified in the SDEIS for which no funding has been allocated? As the SDEIS has numerous references to Premium Bus Service and as the SDEIS was completely silent as to describing this service, its impact, and its cost, the funding source, please describe. A failure to include this information in the SDEIS and to have it available for the public hearing and for comment is a major defect in carrying out the NEPA requirement for rigorous review. Please explain why this important information was omitted. (0109 0128-16)

> ***Response:*** *The Corridor express bus service, formerly referred to as 'premium bus', was described in detail in Chapter 6 the Supplemental Draft ES. This description describes the express bus routes, stops, and service frequencies. Express bus annual operations and maintenance costs were described in Table 6.1-5 of the Supplemental Draft EIS and are described in Table 6.1-13 of the Final EIS. For Loudoun County, the express bus service running into Wiehle Avenue would replace existing express service that currently runs into West Falls Church but not that to downtown Washington. The funding for the express bus service from Loudoun would rely on the funds saved by partially replacing the current Loudoun County express service. The Fairfax County express bus would be comprised of the existing 920 services and 980 services, which currently run to West Falls Church and would terminate at Wiehle Avenue under the Wiehle Avenue Extension. The funding for these services would continue to be based on existing funding sources.*

Public Comment: Based on the project residential and commercial bonuses around the rail stations in Tysons Corner and at the Wiehle station, what is the number of bus riders who will use the Premium Bus Service? (0109 0128-7)

> ***Response:*** *The Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with rail are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS.*

Feeder Bus Consideration

Public Comment: An essential element of the design of each rail station in the Dulles Corridor is effective access via a well-developed feeder bus system. Each station must be carefully designed to assure that future expansion of feeder bus access can be readily implemented. Kiss and ride drop-off points must fit effectively into this mix. (0041 0042-9)

Public Comment: To the extent possible, exclusive feeder bus access lanes should be developed within at least a half-mile of station sites. Transit ridership will be severely reduced if traffic congestion makes the use of the feeder bus no more effective than the use of the private car. (0041 0042-10)

> ***Response****: The preliminary design of the station areas has incorporated these access and expansion principles into the General Plans to the extent possible. Facility improvements identified in the comment that are outside the immediate station areas of the project have become the responsibility of the Project.*

Public Comment: I urge that careful consideration be given to bus access between the Wiehle (initial end) station on this route and the Smithsonian Air and Space Dulles Center complex over and above usual feeder bus access. (0041 0042-11)

Public Comment: The Committee for Dulles also urges that consideration be given to bus access between the end of the rail system and the Steven Udvar-Hazy Center at the Dulles Airport, the new space museum (0067 0075-6)

> ***Response:*** *The Commonwealth of Virginia and the Smithsonian have developed a shuttle service that runs between the Air and Space Museum on Independence Avenue and the Udvar-Hazy Center. Additional services to the Center from Wiehle Avenue may be considered by Fairfax County.*

Public Comment: expansion and enhancement of feeder buses and shuttle systems between major employment centers and the Wiehle Avenue station; (0040 0078-2)

> ***Response:*** *Expansion of the feeder bus and shuttle systems to provide access between major employment centers and the Wiehle Avenue Station would be the responsibility of public transit providers, Fairfax and Loudoun counties, or the companies or institutions themselves.*

General Bus Improvements

Public Comment: I would also suggest that we need more buses. We need more comfortable buses, perhaps bigger buses. We need real-time information as to when the buses are coming. I understand that that is in the words. And we need signal prioritization to allow buses to get through traffic signals more quickly. (0076 0087-2)

> ***Response:*** *The Project Team has recommended that the existing transit service provided by Fairfax and Loudoun Counties be further enhanced beyond the bus rapid transit elements that have already been added. Prior to the opening of LPA Phase 1, additional bus rapid transit elements—including the expansion of the Herndon-Monroe park-and-ride lot (site of the future*

Herndon-Monroe Metrorail Station), ITS enhancements, and facility improvements—should be advanced.

Public Comment: With the concept of a transfer station at Wiehle Avenue in the SDEIS, specify what current bus routes—express routes that now go from Wiehle Avenue and points west directly to West Falls Church metro—will require a transfer to Wiehle Avenue and a forced trip through Tysons Corner. Specify what portion of the boardings or traffic in Tysons consists of passengers who would prefer to bypass Tysons to access the urban core directly. Revise the patronage figures for service thru Tysons to reflect the continuation of current direct express bus service to West Falls Church bypassing Tysons (no forced diversion to rail). Specify the travel time, presumably increased, for those users west of Wiehle who now use express bus service and would be forced to wait for a transfer at Wiehle and would be forced to travel thru Tysons even tho that is not their destination. The table of travel times in the DEIS needs to be completely revised. (0061 0117-20)

Response: *All services run by the Fairfax Connector that currently run into West Falls Church would be turned around at Wiehle Avenue after the implementation of the Wiehle Avenue Extension. There is no way to identify the preference of passengers regarding whether they would like to ride rail through Tysons versus taking a bus into West Falls Church without doing a rider survey. Because the bus portion of the project was defined such that all service would stop at Wiehle Avenue, that is how the ridership forecasting was conducted. The run time for rail from Wiehle Avenue to East Falls Church (the first rail station served by the Dulles service) would be approximately 15 minutes (with a transfer time of 2 minutes, the total trip would be about 17 minutes). Travel time from Wiehle to West Falls Church via the existing Fairfax Connector 980 service is about 15 minutes. However, people are still forced to transfer to rail at West Falls Church, thus also adding a 2-minute transfer time to this trip time.*

Public Comment: The projection of 20- and 30-minute frequencies for any commuter bus service is unrealistic and inadequate for attracting and maintaining most riders in this region (see description of bus routes at 2-10). (0068 0173-11)

Response: *The core Corridor express bus service, formerly referred to as 'premium bus', would run every six minutes in the peak direction, the same as Metrorail service. This service would be supplemented by two 30-minute services running to Dulles Airport (for a combined frequency of 15 minutes). The 20 minutes noted by the commenter are in the reverse peak direction, which is a much higher level of service than exists today.*

Public Comment: Will funding for Phase 1, if it occurs, be used to finance bus service that meets LOS needs and short-time demands of commuters by access to the Dulles Toll Road Access Road ("Access Road) in order to avoid massive gridlock that is prevalent, both during and not during rush hours? (0068 0173-5)

Response: *The Corridor express bus service, formerly referred to as 'premium bus', in the Supplemental Draft EIS would be a high quality service meant to replicate rail service to the greatest degree possible until rail is extended to Loudoun County in the second phase of the project. The service would replicate rail in terms of service to station areas served by rail, service frequency, hours of service, and the fact that there would be high quality service in the reverse peak direction. The service has been designed to be as attractive as possible to auto drivers, and therefore it is the intent that the service will relieve some congestion by attracting auto drivers to transit.*

Public Comment: Will the cost of bus service be cumulative with rail service, or will those bus users be penalized by having to pay an additional fee? What is the fee? (0068 0173-6)

Response: *Corridor express bus service, formerly referred to as 'premium bus', would not be considered an extension of the Metrorail system, as BRT had been in the Draft EIS. Therefore, passengers will pay a bus fare and pay a Metrorail fare. In other words, the extension of rail into*

the Dulles Corridor would not change the relationship between local bus fares and Metrorail that exists today.

Multi-Modal Alternatives

Public Comment: What this region needs is not more rail, which only accommodates ONE mode and 2 percent of all trips, but more highways. A multi-modal network of express highways, bypasses and parkways can accommodate cars, trucks, buses, van pools, car pools and even bicycles. Stop trying to snow job us on all the wonderful thing Dulles Rail is going to do for us, because it's a big lie. (0016 0122-4)

Response: *Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA.*

Tysons Corner Issues

Public Comment: Digging a tunnel through Tysons Corner is wasteful as is placing four Metro stations there and it swallows precious prospective funding. (0068 0076-4)

Public Comment: If you really think rail is best alternative which, by the way, I don't agree with, but if you were to believe that, why would you not say, let's spend that $1.5 billion, why not start at West Falls Church, drop one station at Springhill Road, one station in Reston at Wiehle, on station at Herndon-Monroe, one station at Dulles Airport, get it to Route 772 and, according to the cost estimates that some people with whom I talk, the cost estimates that they come up with, you could do that, if you don't go through Tysons initially, if you just stub out and come back later and do those in-fill stations later on. (0072 0082-4)

Response: *The purpose of the Supplemental Draft EIS was to provide additional opportunities for the public and agencies to comment on refinements that have been made to the LPA since the publication of the Draft EIS. A number of alternatives and Tysons Corner alignments were evaluated in detail in the June 2002 Draft EIS and Section 4(f) Evaluation. Based on the analysis contained in the Draft EIS, public hearings held in July 2002, and comments received on the Draft EIS, the Metrorail Alternative (T6/Y15) was selected as the preferred alternative for the project by the Commonwealth Transportation Board and by the WMATA Board of Directors in late 2002. See Chapter 2 of the Draft EIS and Appendix H of the Final EIS for a discussion of previously considered alternatives.*

Public Comment: The option should be maintained to create an express track in the median of the airport's access road, which would enable airport and corridor travelers to save 17 minutes per trip by bypassing Tysons Corner. The key action at this point in the project's development is to sustain the option for future consideration once Phases One and Two are complete. (0108 0127-8)

Response: *During the public comment period of the Draft EIS,, the Project Team evaluated the suggested alternative using the same social, environmental, economic, and transportation factors used for the evaluation documented in the Final Alternatives Analysis Report (May 2001). This new alternative, called Alignment T12, was not recommended for further consideration in the Dulles Corridor Rapid Transit Project. The reasons for this recommendation are summarized below.*

Alignment T12 would have numerous deficiencies relative to the alternatives previously considered. These deficiencies include increased costs, substantial impacts associated with shifting roadways to accommodate the alignment, reduced ridership, and operational complications.

Overall, because it would have greater costs and fewer benefits than alternatives previously

considered in the Draft EIS, Alignment T12 was not recommended for further evaluation. The full evaluation for Alignment T12 is documented in a technical memorandum.

Vienna and Falls Church Options

Public Comment: Construct middle express track for reversible AM/PM flow. (0064 0152-1)

Response: *The different travel times between the express and local trains would have other operational complications, including possible train "bunching" where the Dulles Corridor line meets the Orange Line, or decreased service frequency through the western end of the corridor.*

Public Comment: We ought to create the Wye to Vienna so that people from the Vienna area or Fairfax or when and if they extend the Metro further west on 66 that those folks can get the vehicle without having to make the interchange and cross a platform at East Falls Church. (0064 0072-6)

Public Comment: Create wye to Vienna so that Orange line riders west of East Falls Church don't have to change trains and double back. (0064 0152-7)

Response: *The proposed LPA alignment does not preclude the eventual construction of two sets of tracks, inbound and outbound, that would provide a seamless connection to the Orange Line outbound of West Falls Church Station.*

Public Comment: We should construct a middle express track for reversible a.m/p.m. traffic from West Falls Church -- or from East Falls Church out to the airport or further. That will increase the capacity and make this trip much shorter. (0064 0072-1)

Response: *The limited amount of space in the existing median of the DIAAH would make the addition of a third "express" track cost prohibitive and have substantially more impact to the DIAAH, the Dulles Toll Road, the Dulles Connector Road and the adjacent communities. A third track would require realignment of practically the entire DIAAH, and a large portion of the DTR in each direction. There would also be substantial additional impacts in Tysons Corner to adjacent properties and roadways. Having a continuous third track would also significantly increase the cost of station facilities, as it would cause wider, split center platforms that would require additional vertical circulation facilities. The different travel times between the express and local trains would have other operational complications, including possible train "bunching" where the Dulles Corridor line meets the Orange Line, or decreased service frequency through the western end of the corridor.*

Route 606 Station
Comparison of MIS Alignment and LPA Alignment

Dulles Corridor
Rapid Transit Project

3.0 SOCIAL EFFECTS

3.1 Land Use and Socio-Economics

A. Draft EIS Comments

Federal Agency Comments

Changes in Land Use and Zoning

Federal Comment: The project must include changes to land use policies and zoning that will support Transit Oriented Development in the project station areas. This should include higher allowable densities, a mix of uses, and compact walkable development patterns within a ½ mile radius of the stations. (049204)

> ***Response:*** *The change in development character in the corridor is discussed in Chapter 5 of the Final EIS. The analysis in the Final EIS addresses potential development at the proposed transit station areas. As stated in f the Final EIS, the land use plans adopted by local government within the Dulles corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will work with the local government to support access to transit stations for pedestrians and cyclists and to implement transit-oriented development initiatives, although implementation of this form of development, including the provision of bike lanes, parking regulations, and demand management measures is under the jurisdiction of the local government. The proposed stations are designed to provide access to pedestrians, cyclists, and feeder bus services, as well as transit-oriented development that might be implemented in proximity to the stations.*

State Agency Comments

Potential for Future Air Rights Development at Stations

State Comment: The engineering for rail should allow for future air rights development. (0131, 0131-T-10)

> ***Response:*** *Proposed parking facilities will be the subject of continuing coordination with Fairfax and Loudoun counties during preliminary engineering. Station designs do not preclude construction of additional parking by others beyond the station facilities. With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Local Agency Comments

Ability of Rail to Encourage Clustered Development

Local Comment: The Draft Environmental Impact Statement has laid out several viable alternatives. Close attention must be paid to the potential impacts of each to surrounding developments, especially residential. The road network in Tyson's Corner is at its limit. Important improvements can and will be made; however, the solution to Tyson's Corner's transportation problems is not in road expansion. And while there are some favorable characteristics of Bus Rapid Transit (BRT), there are clear advantages to rail: The capacity of rail is nearly four times that of buses and, under current proposals, no BRT stations would be located in the heart of Tysons Corner. Moreover, BRT has significant up-front costs and will not encourage the concentration of density at transit hubs, the way rail, with its built-in density triggers, will.

Rail will contain sprawl by creating a magnet for clustered development around stations and will maximize convenience to those living, working, and shopping in Tyson's. And, at a time when our region is struggling to meet EPA's ground-level ozone attainment requirements, rail transportation will improve air quality by removing the most drivers from the road. (0130, 0289-L –4)

> ***Response:*** *Comment noted. The Locally Preferred Alternative (LPA) is a Metrorail Extension. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. The LPA is described in more detail in Chapter 2.*

Public Comments

Land Use and Development at Station Areas

Public Comment: We think the photos are of concern in terms of the attitude of the EIS towards land use. In fact, all the photos have large parking areas and parking structures in them, none illustrating sort of a new urbanist fabric of community that we can have. (0149, 0180-T –12)

> ***Response:*** *It is assumed that this comment refers to the illustrations of station designs in Volume I of the Draft EIS. Stations need to accommodate multiple arrival modes, including pedestrian, feeder bus, and private autos. Each is important in building and maintaining ridership, and availability of daily parking is particularly influential in attracting riders that have a car available for a trip but choose to use transit. Providing such parking does not preclude transit-oriented development adjacent to stations; mixed-use, pedestrian-oriented, compact development can take place around and/or above parking areas. The Project Team will continue to coordinate station plans with adjacent development, in conjunction with VDOT, local governments, and adjacent property owners and developers throughout the Project's implementation.*

Public Comment: The Moorefield Station development to the south and the Loudoun Station to the north are currently being designed with the planned transit station as a focal point. The Loudoun Station plan directs major pedestrian and vehicular activity (via a "Kiss & Ride" and bus stops) toward a plaza opposite the platform, while Moorefield station is proposing an internal bus loop to connect the non-core areas with the station platform. (0014, 0014-L –10)

Public Comment: Reservation Area: The layout of the reservation area has changed as part of the charrette process and the property owners are dedicating 12 acres as shown for the transit station. Subject to the board of supervisor's land use approval of Moorefield Station, the final EIS should incorporate the revised land reservation, with the exact configuration subject to future design. The ultimate access should consider the provision of the separation of the local bus traffic from the public street system. Based on our engineer's review, the footprint shown in the DEIS station plans can be accommodated in the proposed reservation. (0451, 0451-L –6)

> ***Response*****:** *The design team has incorporated these comments into the final General Plans (Final EIS Volume V), based on a site plan provided by the owner/developer that includes a bus-only roadway adjacent to the Dulles Greenway. During preliminary engineering, the Project Team will continue to refine proposed station facilities at the Route 772 Station in coordination with Loudoun County and adjacent landowners and developers.*

Public Comment: We need to be much more proactive in dealing with the interrelationship in three dimensions of land use, the types of land use, the circulation patterns, pedestrian patterns, bicycle patterns, the vehicular patterns of all sorts, internal transportation. I would urge the local officials to put more emphasis on that. (088, 0172-T –10)

> ***Response:*** *Regulations concerning land use, including its relationship to circulation patterns, pedestrian patterns, bicycle patterns, vehicular patterns, and internal transportation are under the control of the local governments in the corridor. The Project Team will work with local*

jurisdictions to support them in implementing land use regulations and access patterns that are developed in proximity to the transit station platforms.

Public Comment: TMS is concerned that the construction of the BRT facilities, particularly the proposed parking structure and aerial bus bridge, bifurcates the substantial land area available for transit-oriented redevelopment, which has a domino effect on accessibility, ridership, and future operating subsidies of the transit system. In particular, creating an origination station in Tysons Corner through construction of a parking facility, particularly in that area, that currently has sprawling vehicle-oriented development, coupled with a permanent bus bridge, represents a substantial physical and psychological barrier to transit-oriented redevelopment within walking distance of the rail station and is inconsistent with the county's comprehensive plans. (0135, 0135-T –5)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Therefore, the Project no longer has effects on the TMS Property or Tysons Self-Storage.*

Public Comment: Reston East/ Wiehle Avenue Station - Whether by bus, metro or whatever, the Station and surrounding area destined for residential?, commercial?, parking? or all of these, must be a visual as well as functional planned architectural solution with the pedestrian in addition to the motorist in mind. As a twenty year resident of the adjacent South Lakes community, I feel fortunate Sunrise Valley Drive from Hunter Mill west to the Reston Parkway has remained so attractive with ample green space still surviving. Only the behemoth Siemens parking affair and associated building has spoiled the landscape. (0072, 0072-CC-1)

Public Comment: And if there are plans for major new facilities like terminals and parking on the sides of the roadway, is there a master plan that integrates that construction with commercial and residential construction? (0181, 0181-T –8)

Response: *As described in Section 3.1 of the Final EIS, the land use plans adopted by local government within the Dulles corridor all contain guidelines to support higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. These plans are under the jurisdiction of local government, including the initiation of transit-oriented development around stations. The project will work with local government and developers that might be interested in developing transit-oriented development around stations. As described in Chapter 9 of the Final EIS, this transit-related development would have an induced effect on the level of density expected to occur in the corridor.*

Public Comment: The Draft EIS ignores the impact of growth associated with the alternatives studied. The population growth in station areas will lead to dramatic increases in vehicular use in other areas besides near the stations. A projected substantial increase in population for the Mid-Corridor, represents a tremendous increase in car traffic due to density increases. The Draft EIS does not address this impact and must do so quantitatively. (0510 03-04)

Response: *The Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS.*

The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the Travel Demand Forecasting Methodology and Results Technical Report (June 2002). The overall level of development expected to occur as a result of the density bonuses in the transit station areas has been discussed in Chapter 5 of the Draft EIS. The projected level of growth and related traffic and other effects were assessed. All neighborhoods within a half-mile of the

transit stations were analyzed to see if they would experience an increase in cut-through traffic or other traffic impacts due not only to the construction of the transit alternatives, but also due, in part, to the increase in traffic associated with the development.

No Build Growth Implications

Public Comment: How does your plan compare to doing nothing if you include changes in behavior? In a sense what I have heard here tonight is that you assume that you need to increase the throughput, okay. On page S-23 of the EIS, it dismisses the possibility of doing nothing because it does not include changes in behavior, whereas doing nothing may encourage businesses to decentralize and move out to where the people are, or people to move in to where the businesses are and end up with a more cost-effective and environmentally beneficial system. (0166, 0166-T –6)

Response: *Population and employment projections, as well as, the regional trends in land use, as presented in Section 3.1 and Chapter 5 of the Final EIS, and the historical trends in development in the region do not support this comment's assertion.*

Need for Coordination with VDRPT

Public Comment: Our overall concern is coordination. The County and VDRPT must actively coordinate land use and road planning with the planning and construction of rail. RA will be happy to assist in that continuing coordination. The recommendations of Supervisor Hudgins' 3-day charette are important to good development and to mitigating the effects on our community. (0233, 0426-M –3)

Public Comment: Now there has been much progress in addressing the land use issue, both in the Fairfax and Loudoun comp plans, and most significantly in the Reston charette recently, but we also think much work remains to be done. (0149, 0180-T –5)

Response: *The Project Team has been actively coordinating with VDOT, Fairfax County, Loudoun County, and other state and local agencies since the project's initiation. Please see Chapter 11 of the Final EIS for a summary of the Project Team's coordination activities since the EIS process was initiated in June 2000.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.

Physical Impacts of Tysons Parking Structure

Public Comment: However, the Owners do have concerns over the specific facility designs for the Tysons [West] rail station. All Metrorail alternatives and the BRT alternative in the Draft Environmental Impact Statement propose that a 2,000-car commuter-parking garage be located on the Security Storage and Templeton Oldsmobile sites. This large structure would occupy one of the key redevelopment sites at the Tysons West Station and is a major concern to the Owners. We suggest that a commuter parking garage of this magnitude is not appropriate for this area. Tysons Corner is viewed as the "downtown" of Fairfax County and, as such, rail service should be planned to implement that vision. Attracting commuters into Tysons Corner so that they may park and use Metrorail to reach other destinations such as Washington, DC, Arlington or Dulles Airport seems contrary to the Tysons Corner Comprehensive Plan. This station area should be planned so as to maximize the number of residents and workers within walking distance of the station. Not only will this garage occupy one of the "100% corners" at the Tysons West station, it will also impede pedestrian flow from adjacent property north and west of the station area. We suggest that this commuter garage be relocated to another station outside of the Tysons Corner area and allow the Tysons Corner stations to function in a more urban not suburban design. (0400, 0400- L-2)

Public Comment: However, if it is concluded that a commuter-parking garage is a necessary component to the Tysons West station, we suggest that there are other design alternatives that would make this commuter facility blend in better with other transit related mixed-use development. For example, if the 2,000-car requirement were spread out over several sites as opposed to being massed on one site, it would allow for better distribution of commuter parking spaces and an ability of the property owners to absorb this commuter-parking requirement as part of their private development. This essentially would result in a joint development effort of public parking and private parking to support a private transit related mixed-use development. We have commissioned studies of how the commuter parking could be integrated into proposed development plans for the 22 acres and find that it could be accommodated without requiring WMATA's acquisition of the Security Storage and Templeton Oldsmobile sites. (0400, 0400- L-3)

> ***Response:*** *For Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.*
>
> *The park-and-ride facility at Tysons West has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts. The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known. The park-and-ride would be accessed from local roads, and its cost is part of Wiehle Avenue Extension.*

B. Supplemental Draft EIS Comments

Local Agency Comments

Issues Related to Comprehensive Plans and Zoning

Local Comment: Section 3.1.1.2. The second bullet under "B. proposed LPA Phase I", is not true since the Comprehensive Plan envisions higher intensity at future stations west of Wiehle Avenue. This bullet should be reworded to indicate that the LPA Phase I is not consistent with the Comprehensive Plan; the wording could be similar to the 3rd bullet which addresses Loudoun County. (0093 0109-12)

> ***Response:*** *The commenter is correct that Wiehle Avenue Extension (formerly LPA Phase 1) is partially consistent with the Fairfax County Comprehensive Plan's goal for high-capacity transit throughout the western part of the Dulles Corridor. This was the intended meaning of the second bullet under Section 3.1.1.2 (B) of the Draft EIS.*

Local Comment: Section 3.1. In the 2nd and 3rd sentence of the 2nd paragraph, the information about the Tysons II rezoning is not correct. The zoning case increased the PDC's potential from about 4,655,000 sq.ft. to 6,821,000 sq. ft. (or an increase of almost 2.2 million square feet). The maximum building height is 30 stories, not 25 stories. The development has 12 high-rise buildings of which four are built (or eight new buildings). The two sentences need to be corrected based on the information provided. (0093 0109-11)

> ***Response:*** *Comment noted. Information regarding the amount of development allowed under the Tysons II rezoning is clarified in Chapter 3 the Final EIS.*

Issues Related to Adjacent Development

Local Comment: Another issue concerns joint development on the north side of the [Wiehle Avenue] station; the final EIS should demonstrate how transit improvements do not conflict with the County's joint development objective for this property. (0093 0109-17)

Response: *In accord with the final Team recommendations for Wiehle Avenue Station, the final General Plans include a site plan that accommodates future joint development at the station. The site of the joint development would be on the current Reston East park-and-ride facility along Wiehle Avenue.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.

Public Comments

Issues Related to Comprehensive Plans and Zoning

Public Comment: The following claims need to be further evaluated in light of realities instead of simply presented by fiat: a. That Phase 1 is consistent with comprehensive plans, planned development and local zoning requirements (e.g., at TABLE 2-2). These claims are particularly questionable since the rail project would drive a wedge between a 640-acre swath of the Upper Potomac Planning District residential properties that serve under the Fairfax County Comprehensive Plan as a low-density buffer between higher densities of Reston and Tysons Corner. (0068 0173-17)

Response: *The Wiehle Avenue Extension (formerly LPA Phase I) is considered compatible with the Fairfax County Comprehensive Plan, which includes high-capacity rapid transit improvements in the Dulles Corridor as part of its long-term plan for the county. Similarly, the Wiehle Avenue Extension would be partially compatible with planned development, as a number of development projects that are currently in various stages of implementation have been planned and designed with the expectation of high-capacity transit in the corridor. Therefore, the Wiehle Avenue Extension would be consistent with the planned development in the eastern part of the corridor, but not in areas west of Wiehle Avenue. The Wiehle Avenue Extension would also be consistent with existing zoning at station areas because the current zoning of property within the proposed station areas permits the construction of transportation facilities as compatible uses. Additional detail about the land use effects of the Full LPA and the Wiehle Avenue Extension is included in Section 3.1 of the Final EIS.*

Public Comment: We also suggest that Fairfax County re-evaluate its mode split data in all future traffic analysis associated with rezoning applications requested for increase in density at rail stops. (0123 0158-12)

Response: *Comment noted. This analysis has been revised in the Final EIS. Population, households, and employment forecasts, which are the basis for the ridership and modal evaluations, were recalculated in the Final EIS using the updated Metropolitan Washington Council of Governments (MWCOG) Round 6.3 Cooperative Forecasts. This information is discussed in Chapters 3 (Social Effects), 5 (Economic Effects), and 6 (Transportation Effects).*

Public Comment: Table 3.1.1 Summary of Land Use Effects. While we generally agree with the macro assumptions in the table, the Tysons Plan, APR nominations and very specific land use applications must further define and quantify the intent of the Tysons Plan. For instance, the Tysons Plan calls for intensifying development up to 1.0 and 1.5 FAR with a 30% increase in height within 1000 and 1600 foot circles around the Tyson's East platform. The text in the current Tysons Plan for Sub-Unit R-2 states certain area plans are limited to a 0.65 FAR, yet land is zoned at 1.0 FAR, C-3. Is the 1.5 FAR based on underlying C-3 zoning, 0.65 limitation in plan or if rezoned to a 3.0 PRM would an increase from 3.0 PRM to 4.5 FAR and limitless height be allowed? The Tysons Plan needs to be modified to be consistent with Rail LPA. (0113 0132-6)

Response: *Comment noted. By federal regulation, regionally approved forecasts must be used in the analysis of the Build Alternatives. Population, households, and employment forecasts, which are the basis for the ridership and modal evaluations, were recalculated in the Final EIS using the updated Metropolitan Washington Council of Governments (MWCOG) Round 6.3 Cooperative Forecasts. This accepted land use data is based on regionally agreed to development parameters such as FAR.*

Public Comment: WEST*GROUP endorses the EIS recommendations of the stated purpose and need with the following provisions: The Fairfax County Comprehensive Plan and specifically the Tysons Corner Urban Center Plan (the "Tysons Plan") must be reviewed, modified and tailored to meet the "higher-density, mixed use development" that is appropriately called for around the proposed rail stations. No action has been taken by the County to accept Annual Plan Review applications, revise the Tysons Plan, create a task force or even discuss required modifications to the Tysons Plan to accommodate increased densities at rail stations. It appears Fairfax County may be waiting for developers to provide "visions plans" at rail stations and concurrently modify Policy and Tysons Plans to accommodate visions, but nothing has been articulated to this date. The Board of Supervisors must articulate the means and methods of accepting, reviewing and vetting "Smart Growth" rail station plans as soon as the Full Funding Grant Agreement (FFGA) is in place, if not sooner. (0123 0158-2)

Public Comment: Clearly, there is a need to revisit the Tysons Corner Urban Center plan now that the site locations have been finalized and a fourth station added to the previously proposed three. This is another station area planning effort that would have to be lead by Fairfax County. (0060 0169-10)

Public Comment: While we generally agree with the macro assumptions in the table, the Tysons Plan, APR nominations and very specific land use applications must further define and quantify the intent of the Tysons Plan. (0123 0158-8)

Response: *Comment noted. The development and revision of the Tysons Corner Urban Center Plan are the responsibility of Fairfax County through its comprehensive planning process.*

Public Comment: While stating one of the purposes of rail is to support the new Loudoun County comprehensive plan and its 1995 plan to “land uses in the vicinity of future transit centers in specific corridors, including centers at the western end of the Dulles Corridor,” the project team did not use the County’s new land use plan in its travel demand projections. While the project team had no choice but to use Round 6.2 of the Metropolitan Washington Council of Governments’ (COG) Cooperative Forecasts for the DEIS -- which relies on the pre-2001 Loudoun plan -- Version 6.3 was available in draft as early as February 2003. This plan calls for high density development near transit stations, but has about 80,000 fewer households than the pre-2001 plan, part of Round 6.2. This means the projections for ridership in this SDEIS could be too low or too high. (0016 0122-17)

Response: *By federal regulation, regionally approved forecasts must be used in the analysis of the Build Alternatives. The Project Team used the demographic and land use projections prepared by the MWCOG (Round 6.2 Cooperative Forecasts) for the Draft EIS and Supplemental Draft EIS, which were the regionally-approved forecasts in place at the time the analysis was conducted. For the Final EIS, the Project Team used the updated Round 6.3 demographic and land use data, which were adopted as the regionally approved forecasts on October 8, 2003.*

Issues Related to Adjacent Development

Public Comment: Since the properties are already improved, how will the reuse plan be prepared and implemented? (0042 0043-5)

Response*: Both Fairfax and Loudoun counties have adopted policies to implement transit-oriented development at the new stations of the Metrorail Extension. The land use plans adopted by local jurisdictions within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and pedestrian and bicycle-friendly development patterns*

near the transit stations. These recommendations have been adopted in the comprehensive plans of Fairfax and Loudoun counties, and would be implemented by the counties through application of their respective zoning ordinances. The Project Team will work with the local jurisdictions to support implementation of comprehensive plan goals.

Public Comment: It is imperative that the final Tysons East Station plan and its appurtenances be carefully coordinated and integrated with WEST*GROUP's master plan. As a dedicator of right of way, rail facilities and a 25% economic stakeholder in the funding of rail, we feel our input demands recognition and we are willing to work with the designers and constructors of rail to come up with the best possible public private plan of the Tysons East Station as well as the balance of the project and look forward to more dialogue as the rail project goes forward. (0113 0132-23)

Public Comment: In addition to CapOne's 1.2 million square feet of development adjacent to the platform, under the existing Tysons Plan, 3.7 million square feet of new density can be achieved on WEST*GROUP's properties within the 1000 and 1600 foot boundaries of the station that must be coordinated and integrated to maximize ridership at the Tysons East Station. We look forward to showing you the WEST*GROUP master plan within the next 30 - 45 days which will impact WMATA's current design. (0123 0158-6)

Public Comment: While it appears WMATA has spent a considerable amount of time coordinating the Tysons East Station with CapOne, WEST*GROUP has been virtually ignored. In addition to CapOne's 1.2 million square feet of development adjacent to the platform, under the existing Tysons Plan, 3.7 million square feet of new density can be achieved on WEST*GROUP's properties within the 1000 and 1600 foot boundaries of the station that must be coordinated and integrated to maximize ridership at the Tysons East Station. We look forward to showing you the WEST*GROUP master plan within the next 30 – 45 days which will impact WMATA's current design. (0113 0132-4)

Response: *Coordination between DRPT, WMATA, and adjacent property owners, including WEST*GROUP, would continue throughout preliminary engineering and final design.*

Land-Use and Development at Station Area

Public Comment: While local land use policy is not within the direct purview of the Supplemental Draft EIS, local government emphasis upon effective land use at each station should considerably expand potential transit ridership well beyond the estimates used by the consultants to evaluate the economic feasibility of the system in the Draft EIS report. (0041 0042-6)

Response*: Regionally adopted Cooperative Population and Employment forecasts developed by the Metropolitan Washington Council of Governments (MWCOG) were used in the development of its ridership forecasts. These forecasts also reflect the inputs of the local jurisdictions in the region, including Fairfax and Loudoun counties. Some station areas would have "density bonuses" related to the presence of rail included in the respective County comprehensive plans. However, these bonuses are not included in the regional forecasts noted above because rail does not yet funded or in operation. A separate analysis showing the impacts of the density bonuses was included in Chapter 9 of the Draft EIS to provide an understanding of their effects.*

Public Comment: Supervisor Hudgins had another public meeting where she committed to appoint a citizens advisory committee to work on land use issues around the Wiehle Avenue Station. I think it is really important to involve the community in the planning for this station, particularly when you take a look at the proposals for parking at the Wiehle Avenue Station. (0060 0063-3)

Public Comment: DCRA believes that the areas around the station should be left to local land use decisions. Likewise, any designs around the station should involve a broad complement of the community actively involved in the design process. (0037 0060-4)

Response*: All local land use decisions, including development around transit stations, are*

controlled by local jurisdictions. In accord with the final Team recommendations for Wiehle Avenue Station, the final General Plans include a site plan that accommodates future joint development at the station. The site of the joint development would be on the current Reston East park-and-ride facility along Wiehle Avenue.

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.

Public Comment: [W]e would urge that this community become very much involved in providing the design guidelines for future development around the station. This could include providing the parking and air rights over the Dulles Access Road, even building over the potential bus turnarounds that were illustrated here tonight. (0060 0063-5)

Response: *Proposed parking facilities will be the subject of continuing coordination with Loudoun and Fairfax counties during preliminary engineering. Station designs do not preclude construction of additional parking by others beyond the station facilities. With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Public Comment: As designs for the station at Route 772 are finalized, we encourage the county, the project planners, and staff at the Washington Metropolitan Area Transit Authority (WMATA) to work together to develop station facilities that also include a mix of shops and services that support nearby residents and workers and create lively and safe station areas. (0060 0169-4)

Response: *Comment noted. Local development plans are under the jurisdiction of the local governments. However, the Project Team will continue to work with local officials throughout the implementation process to support joint development around stations. See Section 3.1 and Chapter 5 of the Final EIS for more information on land use regulations and potential joint development effects of the proposed project. See the final General Plans (Final EIS Volume V) to review current station site plans.*

3.2 Neighborhood, Community Services and Community Cohesion Impacts

A. Draft EIS Comments

State Agency Comments

Potential Effects on Adjacent Communities

State Comment: Will there be any change in lighting in the [WFC S&I] yard or on the mainline? If so, will light trespass and pollution be curbed and contained as it is now? (0424, 0424-E –2)

Response: *There are currently no proposed changes to the current lighting levels and lighting configuration of the West Falls Church Yard in conjunction with this Project. Rail vehicle headlights directed toward the tracks will be the only lighting associated with the mainline. Lighting of stations and facilities will be planned to minimize spillover into residential areas.*

State Comment: With regard to the traction/transformer building [WFC S&I Yard]: will there be any electrical noise (humming)? If so, will it be muffled? Will lights be controlled as above? (0424, 0424-E – 3)

> ***Response:*** *Traction Power Substations (TPSS) do not emit a significant amount of noise or humming and should not be noticeable outside of the building. Lighting at the TPSS will be minimal and provided only at the entranceway to allow for safe entrance by workers, when needed.*

Community Access and Potential Community Effects

State Comment: Toward that end, I comment and support the work of the Dulles Rail Now!, the McLean Citizens' Association and Hallcrest Heights. I agree with their positions. I particularly call your attention to the MCA statement for its thoroughness in highlighting the importance of pedestrian and bus access to the Tysons' stations, as well as the need to mitigate the impact of construction and system noise on nearby communities and businesses. (0012, 0468-L –2)

> ***Response:*** *DRPT is the Project's sponsor and initial owner. However, the responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will continue to coordinate with these jurisdictions and agencies during preliminary engineering and final design to determine the improvements for station access beyond the station site plans, as well as their ownership and maintenance. Impacts due to construction and noise on communities and businesses are included in the Final EIS and, if appropriate, proposed mitigation measures are identified. A summary of these mitigation measures is provided in Chapter 2 of the Final EIS.*

State Comment: Page 188 (of the Land Use Technical Report) Table 4-8 - SUMMARY OF COMMUNITY IMPACTS OF METRORAIL ALTERNATIVE "Access Changes - T1, T6, T9, and T4. Congestion affects two neighborhoods…". This statement would be true if the construction of rail transit in the corridor did not also allow for increased densities. However, the comprehensive plans within the local jurisdictions provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities, and congestion will increase throughout the corridor and beyond.

"Property Values - T1, T6, T9, and T4 Increase at station areas "The comprehensive plans within the local jurisdictions provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities. While this may still result in increased property values at station areas, the increase in congestion throughout the corridor may result in a decrease in property values in other areas. (0421, 0421-A –5)

> ***Response:*** *The Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. Chapter 5 of the Final EIS does present an analysis of the potential effects of increasing densities on the level of development as a result of the two Build Alternatives. The effects of implementing density bonuses in the corridor at Metrorail station areas is also quantified and presented in Table 5.3-1. In addition, density bonuses were included in the analysis of secondary development effects that is presented in Chapter 9 of the Final EIS in relation to traffic. This analysis was included in the Final EIS in order to address comments about the need to quantify the potential effects of increased density on traffic at Metrorail station areas.*
>
> *The counties' development permitting process would mitigate the impacts due to increased densities within the corridor. Fairfax County has adopted non-degradation policies that will limit development that would result in traffic congestion, thus reducing the level of development and*

limiting any negative impacts on property values due to congestion. In addition, an evaluation of property values along other transit corridors in the Washington metropolitan area does not indicate any decrease in property values, even in areas experiencing congested conditions. Actual implementation of transit-oriented development and the timing and increase in densities is under the jurisdiction of the local government, so any mitigation needed to support the increase in densities is also under the jurisdiction of the local government, and they have included measures in their land use regulations.

State Comment: Although viewed mainly as a business center, Tysons Corner is also a major residential area. The preferences of the residents of the Rotunda and other established residential communities deserve special consideration. The goal is to improve the quality of life for residents in the corridor; no one's quality of life should suffer as a result. (0298, 0298-L –5)

Response: *Metrorail Alignment T4, which affected the Rotonda condominium, was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Neighborhood impacts are identified in Section 3.2 of the Final EIS, including those within Tysons Corner. Neighborhood impacts are considered as part of the evaluation process.*

Local Agency Comments

Effects on Community Facilities

Local Comment: The issue of "glare" including guideway, station lighting, and vehicle headlights should be examined. (0479, 0479-L –9)

Response: *There are currently no proposed changes to the current lighting levels and lighting configuration of the West Falls Church Yard in conjunction with this Project. Rail vehicle headlights directed toward the tracks will be the only lighting associated with the mainline. Lighting of stations and facilities will be planned to minimize spillover into residential areas.*

Local Comment: We recognize as well that there are significant pedestrian and school traffic throughout this area. (0165, 0165-T –7)

Response: *Impacts to community facilities are discussed in Section 3.2 of the Final EIS.*

Local Comment: The Draft EIS at Section 3.0 addresses social effects of the proposed Project. It attempts to analyze and identify potential effects on each of the affected communities and their services and facilities. The document, at Section 3.2, states that the section includes consideration of schools. However, the potential impact upon the Falls Church City Public School system, due to the close proximity of the Project and the attendant traffic and safety concerns, is completely omitted. This is another significant oversight that must be addressed. (0122, 0122-A –27)

Local Comment: Overall, we strongly believe the Draft EIS' lack of full analysis could prove disastrous for the City (of Falls Church), the surrounding neighborhoods and our educational structures. Moreover, we suspect there may be a tremendous safety concern if proper evaluations are not conducted. We believe our neighborhood streets will be inundated with motor vehicles and the project will be considered a failure. Existing infrastructures will be adversely affected and must be effectively remedied by operational plans and new facilities. (0122, 0122-A –28)

Response: *Potential impacts to community facilities, such as schools, are summarized in Section 3.2 of the Final EIS. Community facilities located within 300 feet of the centerline of the Build Alternatives and within one half-mile of the proposed station areas were identified for evaluation. Community facilities were evaluated for changes to community cohesion, isolation effects, noise and vibration, access changes, and safety. No effects on the school system of the City of Falls Church are anticipated due to the two Build Alternatives. The athletic fields at George Mason High School, a Falls Church public school, were considered in Section 3.6 of the*

Final EIS. No effects on this recreational resource are anticipated as a result of implementing the Build Alternatives.

Based on the analysis of the forecast traffic volumes for the East and West Falls Church Metrorail Stations, the Project Team does not anticipate that overflow parking onto residential streets will be a problem. Moreover, since completion of the Draft EIS analysis, WMATA has programmed a 960-space parking facility at West Falls Church to be completed in early 2005. The Project Team also initiated meetings with the City of Falls Church to discuss the issues of overflow parking and cut-through traffic.

Large increases in the number of vehicle trips are also not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level. Nevertheless, the Project Team does not anticipate any increases in Project-related cut-through traffic in the City of Falls Church.

Public Comments

Traction Power Substation Locations and Potential Effects

Public Comment: The proposed location of the [Traction Power] Substation severely impacts 2 residences in the [Chathams Ford] neighborhood, which will suffer aesthetic impairment and undue loss of property value. The neighborhood as a whole will also be negatively impacted. (0174, 0300-L –15)

Public Comment: Construct the Traction Power Substation in the cul-de-sac at the end of Chathams Ford Drive where there would be minimal impact to the neighborhood. It's important to demonstrate what these buildings look like. First, they are not like the power utility boxes which many of us have in our front yards. These utility boxes are 4 feet high and 3 feet wide and 3 feet deep. The Traction Power Substations are substantial buildings as much as 90 feet long, 90 feet deep and one story tall. On Chathams Ford Drive, they will be located about 20 feet from the property line and will extend from the driveway of 9613 to the driveway of 9611. There will also be another building called a Remote Train Control Room constructed next to the Substation. These are substantial structures that do not belong in residential neighborhoods. (0174, 0300-L –16)

Public Comment: We recommend that the Traction Power Substation and its companion building be constructed further down Chathams Ford Drive in a vacant cul-de-sac. This location minimizes any reduction in housing values and the aesthetic impairment to the neighborhood. (0174, 0300-L –17)

Public Comment: Next, the proposed Traction Power Substation to be built across from 9613 and 9611 Chathams Ford will create additional noise pollution because of the electrical apparatus inside the building. (0174, 0300-L –9)

Public Comment: The final issue is the traction power stations which will have an impact on several homes. These are very large buildings, up to 90 feet long and 90 feet in depth. We recommend they be moved to the cul-de-sac. (0174, 0174-T –7)

Response: *The location of traction power substations and tie-breaker stations are preliminary. As described in the Final EIS, these ancillary facilities were sited based on systems engineering requirements, environmental, and right-of-way constraints. A power analysis was conducted to determine the number and size of substations required and the optimal spacing for these stations. The locations and enclosure designs of these facilities will be evaluated further during the preliminary engineering and final design phases of the project. See the final General Plans (Final EIS Volume IV) for the current locations of these facilities.*

Community Connectivity

Public Comment: The other thing that I'm noticing is not only for the bus rapid transit, but for metro, is a lack of connection to the surface. (0255, 0255-T –3)

> ***Response:*** *Comprehensive feeder bus plans have been developed for the LPA. These plans identify service frequencies throughout the day, number of trips, routings, and station/stops served. These plans were developed based on consultation with technical staff from Fairfax and Loudoun counties. These plans also reflect county technical staff's estimates of demand for the feeder service as well as additional demand estimates developed by the Project Team. Ultimate responsibility for running these feeder networks will rest with Fairfax and Loudoun counties, who are responsible for the current operations of the systems in each county. See Chapter 6 of the Final EIS for more information.*

Public Comment: One of the things I'm noticing from the statistics here is that for the same operating cost for the bus rapid transit system, you could get triple the penetration of the local neighborhoods. This is particularly important to me because under the current plan, Sterling Park gets apparently nothing. It's a four-mile car trip or, if you're lucky, by bicycle just to get to a station. And likewise, a heavy rail system also needs connectivity to the neighborhoods to work. (0255, 0255-T –5)

> ***Response:*** *The feeder bus plans developed as part of the LPA were completed in consultation with technical staff from Fairfax and Loudoun counties. These plans also reflect county technical staff's estimates of demand for the feeder service. See Chapter 6 of the Final EIS for more information.*

Community Effects of Nighttime Construction

Public Comment: Another frightening aspect of your study is the statement that heavy rail construction at the Orange Line/Dulles connection would take place at night! The only impact I could find was the suggestion that fewer travelers would be inconvenienced. What about those of us who must sleep at night in the surrounding neighborhoods? (0145, 0452-E –6)

> ***Response:*** *The short-term construction effects and noise generated by construction were included in the noise analysis and any adverse effects on neighborhoods identified. Certain construction work at junction of the Metrorail Extension and the existing Orange Line and in the West Falls Church Yard must be completed during Metrorail non-revenue hours.*

Public Comment: What is the perceived impact on the quality of life for all communities and/or neighborhoods near the corridor and proposed transit stations? (0147, 0459-L –10)

> ***Response:*** *A variety of factors were evaluated as part of the community impact assessment included in Section 3.2 of the Final EIS, all of which could affect quality of life. Adverse noise, traffic, and physical intrusion impacts are limited due to the location of the two Build Alternatives within existing rights-of-way. Positive impacts such as increased property values and mobility benefits due to the introduction of transit are also identified in the Final EIS.*

Community Impact Assessment

Public Comment: My neighborhood's concerns revolve around noise, vibration, and traffic. My community [Ellison Heights-Mt. Daniel] borders I-66, rail, and the West Falls Church transit station. Ironically, my community was not listed as an impacted neighborhood. Nor was the Villages condominium complex right next to the Pavilion. Nor were the three neighborhoods bordered by I-66, Haycock Road, and Great Falls Street, a triangle of land where residents already suffer significant noise impacts from I-66 and the connector split. You didn't include the Lemon Road community, one that already suffers from the noise from your maintenance yard. (0145, 0452-E –1)

Response: *Neighborhood impacts are assessed in Section 3.2 of the Final EIS. A community impact assessment for each neighborhood within 300 feet of the centerline of the two Build Alternatives and within a half-mile of new stations were included for evaluations with regards to changes to community cohesion, isolation effects, displacements, noise and vibration, access changes, and safety. Neighborhoods located between the East Falls Church and West Falls Church stations and already in close proximity to rail were not included in the analysis because there are no projected changes in service due to the project in this section of the corridor. However, the 300-foot boundary was used only for the direct community impact assessment and neighborhoods that had projected visual or noise impacts beyond the 300-foot boundary were also assessed in the Final EIS, which is why the Pavilion was included in the neighborhood assessment. Noise impacts for residents in proximity to West Falls Church Station and I-66 were included and have been identified for the Idylwood and Westhampton communities. The Villages Condominium complex was not included because no effects --either community, noise, visual, or traffic-- are projected in relation to the two Build Alternatives. The same is true for the Ellison Heights-McDaniels neighborhood, which is located south of I-66 and just east of the West Falls Church Station, for which no increase in traffic is projected. The same is true for the neighborhoods located in the triangle of land identified in the comment; no through traffic is projected to West Falls Church Station and no community impacts have been identified.*

Public Comment: Your report says that neighborhoods within 300 feet of the centerline of the build alternatives and within one-half mile of the station areas were identified for evaluation. You missed some of us even using those criteria! In addition, we believe your criteria for selecting neighborhood impacts were flawed. Noise and traffic carry much further than 300 feet. We would like to see the impacts identified for a broader area. (0145, 0452-E –2)

Public Comment: So, within the EIS analysis, the listing of neighborhoods that will be impacted by noise and/or vibration for various alternatives is incomplete, thereby making all conclusions incorrect. Please go back, do a thorough analysis of the neighborhoods that may be impacted, and revise your report. (0145, 0452-E –3)

Public Comment: The study area was too restrictive. Neighborhoods within 300 feet of the centerline of the Build Alternative alignments and within one half-mile of the proposed station areas were identified for evaluation. (3-2) (0147, 0459-L –8)

Public Comment: So within the EIS analysis, the listing of neighborhoods that will be impacted by noise and/or vibration for various alternatives is incomplete, thereby making all the conclusions incorrect. Please go back, do a thorough analysis of the neighborhoods that may be impacted, and rewrite the report. (0145, 0145-T –6)

Public Comment: As residents of the Westhampton neighborhood which is next to the West Falls Church Metro station, we also wish to express our wish that the problems of increased noise and traffic, especially cut-through traffic in our neighborhood will receive careful consideration and planning. We hope the Project will include necessary and adequate road and noise mitigation improvements. (0483, 0483-E-2)

Response: *The methodology used for identifying impacts to neighborhoods is based on the techniques described in the Federal Highway Administration's Community Impact Assessment: A Quick Reference for Transportation. Neighborhoods and community facilities were identified within 300 feet of each proposed alignment. Noise impacts were further analyzed within 1,000 feet of the proposed alignment. Generally, noise impacts from the types of facilities proposed are not expected to exceed 200 to 400 feet, depending on the topography. Traffic analyses were also conducted for areas outside of the 300-foot boundary including intersections and routes that provide access to the stations, and all neighborhoods within a half-mile of any new stations were also evaluated.*

The boundary for the noise assessment is not dependent on the listing of neighborhoods. All neighborhoods within 300 feet of the centerline of the two Build Alternatives and within a half-mile of new stations were included as a starting point for the analysis of direct community impacts such as community cohesion, the creation of barrier effects, displacements within neighborhoods, changes in access, or effects on community facilities. Any other neighborhoods outside of this boundary that were projected to experience noise and/or vibration or traffic impacts were then added to this boundary. Noise impacts were further analyzed within 1,000 feet of the proposed alignment. Neighborhoods that are not included in the Final EIS are not projected to experience any effects due to the two Build Alternatives.

The analysis of neighborhoods was based on the best available data and consisted of information obtained from local jurisdictions, field visits, and ADC maps. Neighborhoods that are located between the East Falls Church and West Falls Church stations and that are already near rail were not included in the analysis, since there are no projected changes in service due to the project in this section of the corridor and no potential for neighborhood impacts.

Public Comment: The DEIS reports that the social and environmental effects from the project are anticipated to be minor, especially given the length and complexity of the project, because most of the proposed improvements would occur within the medians of the Dulles Connector Road, DAAR and the Dulles Greenway. (S-27) This conclusion establishes a bias and restricts the community impact assessment. (0147, 0459-L –17)

Response: *This conclusion was reached after an objective analysis of the community impacts associated with the two Build Alternatives. The use of the 300-foot buffer on either side of the alignment and half-mile radii at the transit station areas resulted in the inclusion of numerous neighborhoods in the corridor that were evaluated for impacts as discussed in Section 3.2 of the Final EIS. Few impacts have been identified other than noise and traffic impacts for the vast majority of neighborhoods assessed. Since the two Build Alternatives are located primarily within existing transportation rights-of-way there are few neighborhood and community impacts, in comparison to other alignments on new locations that could include numerous residential displacements.*

Public Comment: There was a lack of public involvement in defining the project's study area. The project team conducted 55 meetings with communities, associations, and other organized groups. Out of the 55 meetings, only 7 were held with community associations. An examination of the listing of meetings, the project team conducted more meetings for business groups or associations that have gone on record supporting the Rail alternative. To gather this information, the study area should be expanded to include all neighborhoods that border or have a link to the geographical area. For example, neighborhoods such as Equestrian Park, Hunter Mill Estates, and Victoria Farms should have been included in community impact analysis. This information should be included in the DEIS for public review. (0147, 0459-L –18)

Public Comment: The DEIS failed to meet the standard described in the Federal Highway Administration's Community Impact Assessment: A Quick Reference for Transportation. (3-33) This resource states that analysts should recognize that the project may have social consequences to communities well beyond the immediate geographic area (p. 12). Analysts for this project failed to fully analyze the community impact beyond the immediate geographic area. (0147, 0459-L –9)

Response: *The methodology used for identifying impacts to neighborhoods is based on the techniques described in the Federal Highway Administration's Community Impact Assessment: A Quick Reference for Transportation. The Project Team did consider consequences to communities beyond the immediate geographic area. Neighborhoods and community facilities were identified within 300 feet each of proposed alignment. Noise impacts were further analyzed within 1,000 feet of the proposed alignment. Generally, noise impacts from the types of facilities proposed are not expected to exceed 200 to 400 feet, depending on the topography. Traffic analyses were also conducted for areas outside of the 300-foot boundary including intersections*

and routes that provide access to the stations, and all neighborhoods within a half-mile of any new stations were also evaluated. The 300-foot buffer and half-mile radii were the starting point and focus for the direct community impact assessment included in Section 3.2 of the Final EIS. Any other neighborhoods that were projected to have dispersed effects, such as noise or traffic effects, outside of this boundary were added to the neighborhood analysis.

Public Comment: The Draft Environmental Impact Statement (DEIS) failed to analyze the community impact resulting from placing an industrial level rail facilities at the Golf Park on Hunter Mill Road. The Golf Park is bounded on the west by Hunter Mill Rd, on the north by Crowell Road, on the south by the Dulles Toll Road and on the east by Victoria Farms, a community of single family homes on Rural Estate (RE) planned and zoned land. It should be noted this property has been the subject of much community activity to include a law suit that went to the Virginia Supreme Court where it was reaffirmed the underlying planning for this property remains RE, even with the Golf Park use. (0148, 0463-L –1)

Response: *This property is identified as residential on the land use map as described in Chapter 3 of the Final EIS. Federal regulations require that analysis of parkland effects, as included in Section 3.6 of the Final EIS, include publicly owned and operated areas protected under Section 4(f) regulations. Thus, the privately owned Golf Park, also known as the Thoburn property, was not included in the analysis. It should be noted that the Golf Park is already buffered from the Dulles Toll Road and surrounding developments by existing berms, and that the property owner has submitted redevelopment plans for the Golf Park, although those have not been approved by Fairfax County.*

Public Comment: More importantly, the proposed system would create much new activity in our neighborhood, including years of construction and increased traffic and then probably an elevated track with associated noise. There also is proposed a "driver comfort station" immediately adjacent to our neighborhood, which is sure to be a nuisance. The elevated track would parallel my street, Greenwich, and would be a major disturbance. (0307, 0307-E –2)

Response: *The BRT with its bus layover facility in the median of the Dulles Connector was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. See Chapter 2 of the Final EIS for a summary of impacts and mitigation associated with the Locally Preferred Alternative.*

Public Comment: If the project does go through, I urge consideration of noise/traffic abatement measures and construction of appropriate barriers. Possibly such construction could include development of a long-needed pedestrian walkway parallel to the barriers and the Dulles access right-of-way, which could allow persons to finally walk safely and efficiently from our neighborhood and adjacent areas to the West Falls Church station. (0307, 0307-E –4)

Response: *Noise abatement and traffic mitigation measures will be incorporated into the design of the Locally Preferred Alternative (LPA) as specified in Chapters 4 and 6 of the Final EIS. Noise abatement measures would be located within the median of the Dulles Connector Road adjacent to the alignment of the Wiehle Avenue Extension and would not include the construction of a parallel pedestrian walkway as requested in the comment.*

Public Comment: WMATA and VDRPT need to provide more detail on social and community impacts. The documents provide scant review of the impacts of increased traffic on residential streets leading to rail stations. (0112, 0462-L –49)

Public Comment: In addition, we believe your criteria for selecting neighborhood impacts were flawed. Noise and traffic carry much further than 300 feet. (0145, 0145-T –5)

Public Comment: Your report says that neighborhoods within 300 feet of the centerline of the build alternatives and within one-half mile of the station areas were identified for evaluation. You missed some of us even using those criteria. (0145, 0145-T –4)

Public Comment: Not only is this present evaluation incomplete and inadequate for the area selected (1/2 mile of a rail station), limiting the study to that area failed to reflect the true impact throughout the community. I don't know what organization selected that 1/2 mile radius, but is resulted in a study that is flawed by any objective standard. Nobody desiring a complete objective study of the environmental impact of the project would accept such a limited view of such a massive project. Reston is a planned community and it's neighborhoods are interdependent and not islands separated by artificial boundaries (i.e., the 1/2 mile circle) such as the ones selected for examination by the draft EIS. The failure to fully evaluate these impacts show a failure of the draft Environment Impact Statement to fulfill the requirements of such an endeavor. I am in favor of rail to Dulles and have been for years; however, the incomplete evaluation presented by the EIS is not acceptable and fails to inform the public adequately. (0454, 0454-E –3)

Public Comment: Though Sections 3 and 9 of the DEIS may meet some threshold technical compliance with NEPA, they do not answer the affected residential community's most obvious and fundamental questions about impact on school boundaries, traffic volumes for local roads, and the natural environment. With the enormous public resources and expertise assembled for this project, a reasonable person expects that impact on communities served by local roads between Reston and Tysons Corner and Reston and Oakton would be a focus of the study. (0460, 0460-L –2)

> ***Response:*** *The analysis of neighborhoods was based on the best available data and consisted of information obtained from local jurisdictions, field visits, and ADC maps. Neighborhoods that are located between the East Falls Church and West Falls Church stations and that are already near rail were not included in the analysis, since there are no projected changes in service due to the project in this section of the corridor and no potential for neighborhood impacts.*
>
> *The methodology used for identifying impacts to neighborhoods is based on the techniques described in the Federal Highway Administration's Community Impact Assessment: A Quick Reference for Transportation. Neighborhoods and community facilities were identified within 300 feet of each proposed alignment and within a half mile of new stations in order to assess traffic on roads that provide access to the stations. The detailed evaluations are included in the Land Use and Socioeconomics Technical Report (June 2002) and summarized in the Final EIS. In evaluating the potential for an increase in cut-through traffic in residential areas, all access points to neighborhoods were evaluated. In most cases, the primary access routes to the stations are not through residential areas, but along major arterials such as Route 123, Route 7, Wiehle Avenue, and Reston Parkway that border neighborhoods. See Chapter 2 of the Final EIS for a summary of potential impacts and mitigation associated with the Project.*

Public Comment: On the pages 333 of the EIS, in reference to impacts to neighborhoods, communities and community services, it is noted that the topic areas described in the Federal Highway Administration's Community Impact Assessment, A Quick Reference for Transportation, certain topics were used. I have a copy of that book because I have used it in other things looking at community impact. There are many other areas in here talking about community impact that I would like for you to analyze. Specifically it notes that you should look at the impact of traffic shifts in the community. You have to look at the impact of communities when there's not sufficient parking. You were supposed to look at -- or you could look at land uses when these findings could make an impact on schools. (0147, 0249-T –3)

> ***Response***: *The analysis of traffic shifts and parking spillover in neighborhoods were included in the Final EIS. These impacts are summarized in Section 3.2 of the Final EIS. Potential impacts to community facilities, such as schools, were also considered in the analysis. Community facilities located within 300 feet of the centerline of the LPA and within one half-mile of the proposed station areas were identified for evaluation. Community facilities were evaluated for changes to community cohesion, isolation effects, noise and vibration, access changes, and safety. In addition, after the noise and visual impact analysis became available, it was reviewed to ensure that all neighborhoods affected were included in the analysis.*

Public Comment: As you and other leaders consider the selection of an alignment, please remember that the area of the Tysons Central B station is where the greatest density of residents in Tysons live today. It is also the location of the greatest planned residential growth in Tysons for the future, with or without the transit station. These residents will want and deserve the convenient access to transit that alignment T4 provides. You have the ability to plan for that now. (0084, 0084-L –8) (0084, 0458-E –7)

> ***Response:*** *The Alignment T4 was eliminated from further consideration after the public and interagency review and comment on the Draft EIS, due to its visual effects. However, the Locally Preferred Alternative evaluated in the Final EIS includes four Tysons stations along Alignment T6.*

Public Comment: Citizens deserve unbiased and adequate community impact assessment. Draft EIS failed to follow Federal Highway Administration's (FHWA) Community Impact Assessment methodology. The Draft EIS fails to supply a meaningful level of detail of impacts to communities. (0148 03-01)

> ***Response:*** *The analysis of neighborhoods was based on the best available data and consisted of information obtained from local jurisdictions, field visits, and ADC maps. The methodology used for identifying impacts to neighborhoods was based on the Federal Highway Administration's Community Impact Assessment: A Quick Reference for Transportation*.

Public Comment: The Project Team failed to consider important factor in FHWA's Community Impact Assessment and failed to consider a larger study area for communities to be affected by the project. Also a failure of the Project Team to analyze and report interconnections between community impacts. The Project Team should have assessed and reported how differing impacts relate to each other, noting direct and indirect impacts as well as cumulative and counter-balancing impacts. (0148 03-02)

Public Comment: Project Team failed to meet FHWA standards and Draft EIS fails to account for impacts by limiting study area to 300 feet. The Project Team should be required to follow the FHWA methodology and expand the geographic area. (0148 03-03)

> ***Response:*** *The FHWA methodology was used as a guide since FTA does not have a comparable methodology for assessing community impacts. Neighborhoods and community facilities were identified within 300 feet of each proposed alignment and within a half-mile of new stations to assess traffic on roads that provide access to the stations. Noise impacts were further analyzed within 1,000 feet of the proposed alignment. Section 3.2 of the Final EIS discusses neighborhood and community impacts, and the Land-Use and Socioeconomic Technical Report (June 2002) provides a detailed discussion of impacts and a complete listing of all communities that would be affected by this project. Where applicable, interconnections between neighborhoods and impacts are discussed together, particularly in Tysons Corner and the Mid-Corridor. Chapter 9 of the Draft EIS and the Final EIS discuss direct and indirect, or secondary and cumulative effects of the project on the surrounding neighborhoods.*

Public Comment: The Project Team failed to assess impacts of higher densities due to bonuses, especially with regard to increased travel demand on Hunter Mill Road, Sunset Hills Road, and Sunrise Valley Drive at the intersection of Hunter Mill Road. The Draft EIS failed to complete a community impact assessment that evaluated the impacts on identified nearby roadways. (0148 03-04)

> ***Response:*** *Based on a decision by the Fairfax County Land-Use Task Force, no land use changes are slated for the Hunter Mill Road area; therefore, the projected increase in densities does not apply to Hunter Mill Road.*

Concerns Over in Change in Development Character Near Stations

Public Comment: The draft EIS does not show the impacts to neighbors that can result from increases in density that can be granted in the vicinity of rail stations. The EIS should be revised to show the zoning categories and density that can be granted under both existing and proposed density bonuses in the vicinity of the proposed rail stations. This information should be shown on maps, and the change this

represents in density and zoning categories over current conditions should be described. (0392, 0392-L –16)

> ***Response:*** *The change in development character around potential station area locations in the corridor is discussed in Chapter 5 of the Final EIS. The analysis presents the potential effects of increasing densities as part of the discussion of secondary development. This analysis was included in the Final EIS to address comments received during the public scoping process about the need to quantify the potential effects of increased density at transit station areas.*

Need for Appropriate Mitigation of Neighborhood Impacts

Public Comment: While recognizing the need for a new transportation infrastructure, appropriate measures must be planned to mitigate increased noise, pollution, and traffic that will affect the quality of life and reduce property values for the surrounding communities, including the Westhampton neighborhood near the West Falls Church Metro Station. (0414, 0414-L –2)

> ***Response:*** *The Final EIS does identify noise impacts to residences within the Westhampton neighborhood. Mitigation is summarized in Chapter 2 of the Final EIS for all impact areas evaluated for the proposed project. No increase in traffic is projected through the neighborhood itself and there is no projection of a loss of property values in the Westhampton neighborhood, since the only impact identified --noise-- will be mitigated.*

Public Comment: Community impacts are relatively minimal. The fact that there will be no residences and less than 10 business properties directly taken for this 24-mile project needs to be stressed. Just compare this minimal impact to what the Beltway expansion would do as presented recently. There will be noise impacts, but generally not severe except where trains must turn or switch tracks. Mitigation for nearby residences at such locations is available. In the worst cases, though the DEIS does not seem to indicate the need, mitigation may require enhancing the soundproofing of affected residences near rail yards or tail tracks. The elevated portions and above ground stations create the most visual impacts. Attractive designs and co-location of existing above ground utilities, particularly along Route 7 and elsewhere at Tysons, with the rail elevated structures would be a benefit to the community. (0208, 0208-M –4)

Public Comment: Aesthetics - The heavy substructure of the proposed aerial heavy rail in Tysons Corners is visually intrusive. It resembles elevated trains from the past rather than 21st century technology. (0402, 0402-L –13)

> ***Response***: *The Project Team recognizes that the aerial guideway and stations are important visual elements that merit careful study and sensitive treatment; these elements would be refined during preliminary engineering and final design. The final Team recommendations state: "With respect to Metrorail aerial structures, the Project Team should consider aesthetic designs that are compatible with the surrounding environment."*

Public Comment: Concerned about overflow parking from transit stations. There is no information about alternative mitigation measures due to increased densities. (0148 03-05)

> ***Response:*** *The Project Team is not anticipating overflow parking at transit stations as a result of the project. Fairfax and Loudoun counties and their residential communities might implement 'parking by permit only'. The level of development projected in the Final EIS represents a worst-case analysis and local government may limit growth if their mitigation measures designed to limit the effects of increased density are not being achieved. Actual implementation of transit-oriented development and the timing and increase in densities is under the jurisdiction of Fairfax and Loudoun counties, so any mitigation needed to support the increase in densities is also under the jurisdiction of the counties, and they have included measures in their land use regulations.*

Public Comment: Requests continued dialogue between design team and communities on project impacts and mitigation throughout the design process. (0430 03-04)

> ***Response:*** *The Project Team will coordinate with the Westhampton neighborhood and Fairfax County through the preliminary engineering and final design phases of this project.*

Concern for Impacts to Neighborhoods and Community Facilities

Local Comment: Commenter does not have any comments on the *Public Hearings Report*, however, he would like to receive conceptual and final design plans, as the project may affect the City's water system. (0497 3-01)

> ***Response:*** *The City of Falls Church Public Utilities Department has been added to the mailing list and will receive the Final EIS and final General Plans.*

Public Comment: What is the anticipated noise, vibration, and visual impact for the Hunter Mill Estates and Victoria Farms communities, which are adjacent to the Dulles Corridor? (0460, 0460-L –10)

> ***Response:*** *There are no noise, vibration, or visual impacts identified in Hunter Mill Estates or Victoria Farms neighborhoods.*

Public Comment: Now with metrorail all residents of 8340 Greensboro will never have a peaceful life after a hard day of work. Please think of another alternative and develop the project closer to the larger corporation i.e., Gannett office. They need it more. (0055, 0055-CC-1)

Public Comment: I really believe that if they put in an elevated railway through Tyson's Corner, they're going to make a slum area out of it. They're going to turn it into a slum area. There's no two ways about it, because there's nobody in their right mind. Let's say for argument's sake I have an apartment right on West Park Drive. There's going to be a station there, according to that T-4 plan. Who could I sell that apartment to when I want to retire? (0085, 0281-T –2)

Public Comment: I'm fully in agreement, we do need the transportation to relieve the traffic congestion. But everybody seems to be talking about either buses or trains, that are Metrorail's. But when they speak of the Metrorail, nobody seems to be particularly concerned about whether it's above-ground or underground. And I feel certain, after all my years living in various cities throughout the United States and other places, that wherever they put a Metrorail or a railroad through a residential area, or any sort of congested area, you create a slum. (0085, 0281-T –1)

Public Comment: The anticipated noise, vibration and view stand to reduce the desirability of the affected [Rotunda] units and thus reduce their resale value. This comment is based on the post-construction value. The value of these units during construction would be even worse. (0156, 0156-T –3)

Public Comment: My condo, bldg. 2-222 second floor unit, backs to Westpark Drive. The existing traffic & noise is awful. Can't imagine how horrible additional people, traffic and noise would be if this loop or spur were run on Westpark behind our 2 bldgs. (0020, 0020-L –2)

Public Comment: I am very concerned about the impact it is going to have on the value of the properties in the Rotunda Condominiums. Also the noise, dirt and new traffic problems.
(0053, 0053-CC-1)

> ***Response:*** *Alignment T4 was eliminated from further consideration after the public and interagency review and comment on the Draft EIS, in part due to its visual effects.*

Public Comment: We do have serious issues, however. These would be about noise and traffic - both during and after construction! For our purposes, neither of these issues is sufficiently addressed, if at all, in the EIS. I and others have personally attended all the public meetings on this issue over the last two

years, and in speaking with the project representatives at such meetings, we were assured that our concerns would be addressed in detail. Sadly, this has not happened. (0126, 0126-E –2)

> ***Response:*** *Noise impacts are assessed in Section 4.7 of the Final EIS. Specific impacts of operation and construction are also discussed. Traffic impacts are discussed in Chapter 6. In these sections, the impacts are identified, and proposed mitigation measures available to reduce unavoidable impacts are discussed.*

Public Comment: It is our impression that The Project has bigger fish to fry, and cannot take the time to address localized issues, although this in fact is a legal requirement. Our property is not even listed in the EIS as an impacted neighborhood, although we are located virtually next to the West Falls station and the turnout and curve for the new Dulles extension. (0126, 0126-E –3)

Public Comment: It is our impression that The Project has bigger fish to fry, and cannot take the time to address localized issues, although this is in fact a legal requirement. Our property is not even listed in the EIS as an impacted neighborhood, even though we are located virtually next to the West Falls station and the turnout and curve for the new Dulles extension!! (0126, 0199-M –3)

> ***Response:*** *With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road. Localized issues, including a community impact assessment, have been considered in the Draft and Final EIS. Neighborhoods within the vicinity of the West Falls Church Station include residences in close proximity to the station, and are most likely located in either the Idylwood or Westhampton neighborhoods, which were included in the analysis.*

Public Comment: Chathams Ford Drive is a half-mile-long street which runs adjacent to the eastbound lanes of the Dulles Toll Road between Beulah and Trapp Roads. There are approximately 17 residences in the neighborhood. We believe that the residences will experience a series of numerous disruptions from whatever transit proposals are selected. The adverse impacts fall into three categories: Excessive noise, water hazards, and intrusive buildings. (0174, 0174-T –1)

> ***Response:*** *Effects to the Chathams Ford neighborhood were evaluated as part of the Final EIS. Such effects are summarized in Section 3.2 of the Final EIS. Mitigation measures proposed to address noise effects are described in Chapter 4 of the Final EIS.*
>
> *A stormwater best management pond and traction power substation are proposed to be constructed north of Chathams Ford Drive in an undeveloped strip of land between Chathams Ford Drive and the Dulles Toll Road. These facilities are located primarily within the right-of-way for the Dulles Toll Road and no water impacts or intrusion in the neighborhood due to these facilities are projected. The locations shown in the General Plans of these ponds throughout the corridor are approximate and were included to illustrate that a potential need for one of these facilities exists in the vicinity of the location shown. During preliminary engineering, a comprehensive drainage study will be undertaken for the entire corridor to address final locations of all Best Management Practices (BMP) and Stormwater Management (SWM) ponds. This effort should result in some facilities being eliminated, consolidated, or relocated to further minimize impacts to the adjacent areas.*
>
> *The location of traction power substations and tie-breaker stations are preliminary. As stated in Section 2.4 of the Final EIS, these ancillary facilities were sited based on systems engineering requirements and environmental and right-of-way constraints. In addition, a power analysis was conducted to determine the number and size of substations required and the optimal spacing for these stations.*

Public Comment: I worry when I read that rail transit systems do not reduce traffic congestion. I worry about the impacts on our neighborhoods, the traffic, the schools, road widenings. (0147, 0177-T –3)

Response: *Discussion of impacts to neighborhoods, community facilities such as schools, and the transportation system are included in Section 3.2 of the Final EIS.*

Public Comment: Please tell us what redeeming social features are provided by an elevated train operating adjacent to our home. (0021, 0021-L –3)

Response: *Alignment T4 in Tysons Corner was eliminated from further consideration after the public and interagency review and comment on the Draft EIS, in part due to its visual effects. At junction of the Metrorail Extension and the existing Orange Line, the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road.*

Community impacts to neighborhoods are discussed in Section 3.2 of the Final EIS. Potential impacts include noise, vibration, visual, and traffic impacts within specific neighborhoods. Positive impacts associated with the project include improved mobility and access to transit services, and for neighborhoods located within proximity to a transit station, a projected increase in property values.

Public Comment: Believes that the Westhampton neighborhood is subject to disproportionate share of impacts of noise, traffic, air, and visual pollution. States that nowhere else on the Metrorail system are a park-and-ride facility, freeway (Dulles Connector Road), rail yard, and an aerial track simultaneously located near residences. (0430 03-01)

Response: *The Project Team is aware of Westhampton's concerns. With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road. The Project Team will coordinate with the Westhampton neighborhood and Fairfax County through the preliminary engineering and final design phases of this project.*

Public Comment: The Draft EIS lacks an analysis of how increased residential development would affect educational infrastructure and school districting, particularly when facing a substantial increase in population. (0510 03-01)

Response: *Chapter 9 of the Final EIS analyzes secondary and cumulative effects.*

Public Comment: The Project Team did not use a 'systems approach' to address community concerns and should implement a systems approach to impacted communities or explain why such an approach was not used. Had a systems approach been used, the core principles of TEA-21 and the planning goals of FTA would be incorporated and the report would address the problems of total noise mitigation, pedestrian access, and the provision of adequate feeder bus service. (0392 03-01)

Response: *The Draft EIS, the Supplemental Draft EIS and the Final EIS document the systematic approach that was undertaken to assess the potential effects of the proposed alternatives. Each document references the relevant laws and regulations considered, describes the methodologies used, define the study areas assessed, documents the existing conditions in the study areas, predicts the direct and construction related effects, and identifies proposed mitigation measures available to for any unavoidable substantial impacts.*

Public Comment: Increased concerns regarding crime, particularly auto thefts near the Rotonda. It is widely known that there is a higher crime rate at parking garages and locations where commuters leave their cars all day. (0496 3-01)

Response: *Metrorail Alignment T4, which affected the Rotonda condominium, was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

The Project Team agrees that safety is a serious concern and, as standard practice, WMATA employs many measures to ensure patron safety at each of the stations and on the trains. Section 3.7 of the Final EIS addresses safety and security issues related to existing and proposed Metro stations, parking areas, and vehicles.

Public Comment: Although a transit station in the area will make commuting between Dulles and D.C. easier, it would turn a residential area like the Rotonda into an area that resembles a busy section of D.C., which will drive down the value of our homes. Also concerned about the views from the apartments causing a decrease in property values. (0496 3-02)

Response: *Alignment T4, which was aerial at the Rotonda condominium, was eliminated from further consideration after the public and interagency review and comment on the Draft EIS, due to its visual effects, in part due to its visual effects.*

Potential Effects on Adjacent Communities

Public Comment: Light Flashes at Tie Breaker Locations: A brilliant flash of light because of electrical arching can occur when a train third-rail shoe crosses a tie-breaker in the third rail. This is a potential nighttime nuisance to adjacent residential neighborhoods. The EIS should be revised to discuss this situation and describe how adjacent residential areas would be protected from this potential nighttime nuisance where it would occur. (0392, 0392-L –21)

Public Comment: Light flashes - The light flashes created when trains pass over tie breakers is a potential nighttime nuisance for nearby residents and others. (0402, 0402-L –14)

Response: *The design for the contact rail system provides for bridgeable and non-bridgeable gaps, and complies with WMATA design criteria. It is the non-bridgeable gaps (greater than about 45 feet) that cause the arcing/bright lights. This is due to the fact that a shoe actually departs from an electrical circuit, such as the third rail. Bridgeable gaps require an additional rail section and a direct current feeder breaker at the associated tie-breaker station or substation. The proposed sectionalizing scheme, while costing more, eliminates current interruption to the traction motor on the vehicle, reduces wear and tear on motors, and eliminates the arcing.*

Most of the WMATA gaps are bridgeable and, therefore, will not produce any flashing. The exceptions are:

1. *At mainline turnouts to yard(s). Note that this traffic would probably be low speed, and arcing would, therefore, be considerably reduced compared to what would be produced by an accelerating or high-speed train.*
2. *At some of the storage/pocket track turnouts (but only in the direction of the storage track; the mainline gap is bridgeable). As with the mainline turnouts, these gaps are probably associated only with low-speed train operation.*
3. *At the junction of the Metrorail Extension and the Orange Line outbound from East Falls Church Station.*

During preliminary engineering, these locations can be evaluated further to determine if it is possible (and desirable) to provide non-bridgeable gaps

Need to Service Dense Residential Areas

Public Comment: As you and other leaders consider the selection of an alignment, please remember that the area of the Tysons Central B station is where the greatest density of residents in Tysons live today. It is also the location of the greatest planned residential growth in Tysons for the future, with or without the transit station. These residents will want and deserve the convenient access to transit that alignment T4 provides. You have the ability to plan for that now. (0084, 0084-L –8) (0084, 0458-E –7)

Response: *Alignment T4 was eliminated from further consideration after the public and interagency review and comment on the Draft EIS, in part due to its visual effects. However, the Locally Preferred Alternative evaluated in the Final EIS includes four Tysons stations along Alignment T6. The mobility benefits cited have been identified in the assessment of community impacts in Section 3.2 of the Final EIS.*

Compliance with NEPA

Public Comment: The Draft EIS and the *Public Hearings Report* do not meet the requirements of NEPA and related law, regulations, and guidelines. (0148 03-06)

Response: *The Draft EIS fully complies with the regulations cited. The Draft EIS included a detailed analysis and objective evaluation of a No-Build Alternative as well as four Build Alternatives. All alternatives carried forward for detailed study in the Draft EIS were those deemed to be reasonable from a common sense, technical, and economic standpoint, as documented in the Final Alternatives Analysis Report (May 2001).*

The Project Team is confident in the comprehensiveness of the Draft EIS, having received a positive statement from the U.S. Environmental Protection Agency (EPA). EPA has granted the Draft EIS its highest rating for environmental documentation, and remarked that it has not identified any potential impacts that would require substantive changes to any alternative.

B. Supplemental Draft EIS Comments

State Agency Comments

Need to Mitigate Community Impacts

State Comment: This table (Table 3.1-1) indicates that there is "no change" in effects of T6/Y15 vs. the Full LPA. This section of the report needs to address how increased traffic volume, traffic congestion, and spillover parking will be handled by the Project. (0091 0106-4)

Response: *The "No Change" in Table 3.1-1 of the Supplemental Draft EIS refers to the difference in impacts estimated for the Metrorail Alternative that was evaluated in the Draft EIS compared to those estimated for the LPA that was evaluated in the Supplemental Draft EIS. The impacts to community resources are listed in the columns with the heading "Locally Preferred Alternative."*

Public Comments

Concern for Impacts to Neighborhoods and Community Facilities

Public Comment: As residents in the West Lewinsville Heights neighborhood of McLean, Virginia, we are submitting this letter to the officials of the Dulles Corridor Rapid Transit Project, Washington Metropolitan Area Transit Authority, and to our local representatives. We are one of many households that border the Dulles Connector Road and as such, the proposed Dulles Corridor Rapid Transit Project will directly impact us. Our concerns are that the Project will impose additional adverse impacts on our property and our quality of life in the following categories:

- Increased noise pollution
- Increased light pollution
- Adverse visual aesthetics
- Increased drainage problems

We feel that if the Rapid Transit rail line is built in the median strip as proposed, the noise pollution, added lighting, and the visual aesthetics to our home and to others in similar circumstances will be profoundly impacted in a negative way.

We do not oppose the construction of the Rapid Transit Project, but we do feel that due to the increased burden it's construction will place on those of us who are directly adjacent to the project, that the WMATA should place a high priority on protecting homeowners from adverse environmental impacts both during the construction of the Rapid Transit Project and after the construction has been completed and the trains are running. In our opinion an environmental wall would be the major solution to our concerns. Such a wall would alleviate three of our major concerns, noise, light, and visual impact. (0147 03-01)

Public Comment: We are one of many households that border the Dulles Connector Road and as such, the proposed Dulles Corridor Rapid Transit Project will directly impact us. Our concerns are that the Project will impose additional adverse impacts on our property and our quality of life in the following categories:
- Increased noise pollution
- Increased light pollution
- Adverse visual aesthetics
- Increased drainage problems

We feel that if the Rapid Transit rail line is built in the median strip as proposed, the noise pollution, added lighting, and the visual aesthetics to our home and to others in similar circumstances will be profoundly impacted in a negative way. (0081 0107-1) (0124 0159-1) (0125 0160-1) (0126 0161-1) (0127 0162-1) (0128 0163-1) (0129 0164-1) (0133 0172-1) (0100 0116-1) (0101 0118-1)

> ***Response:*** *The estimated effects of the Full LPA (formerly, the LPA) and the Wiehle Avenue Extension (formerly LPA Phase 1) on visual conditions, noise, and water resources are presented in Sections 3.4, 4.2, and 4.7 of the Final EIS, respectively. The specific neighborhoods that have been identified that could experience effects due to the LPA are listed in Table 4-9 of the Land Use and Socioeconomics Technical Report (June 2002). There are no noise, vibration, or visual impacts identified in the West Lewinsville Heights and Great Falls Manor neighborhoods. The Final EIS further refined the assessment of impacts and identified potential commitments to mitigate those impacts.*

Issues Related to Impacts on Neighborhoods

Public Comment: As a resident of the Pimmit Hills neighborhood, located near the proposed Tysons East station, I am interested in trying to build momentum and support for DCRTP in my neighborhood by showing residents that their home will increase in value significantly when the extension is built. (0031 0032-1)

> ***Response:*** *While the Draft EIS and Supplemental Draft EIS do not quantitatively estimate any changes in the relative socio-economic characteristics of the neighborhoods that would benefit from proximity to the project, increased transportation access in the Dulles Corridor is expected to have a corresponding increase in property values near the stations.*

Public Comment: Proposed financing mechanisms and historic transit construction costs do compound my concern that irrevocable damage will be done to the Reston Community if Wiehle is utilized as a terminus/collector station. (0047 0048-2)

Public Comment: I live off Soapstone near Sunrise Valley Drive, and strongly oppose any Dulles Rail stop at Wiehle Avenue. Reston Town Center would be a fine location for a stop because there are restaurants, shops and the beautiful Hyatt Regency. Wiehle is a residential area that would be compromised by the addition of Dulles Rail. Dulles Rail would add NOTHING to this area except more traffic and countless other problems that accompany a rail stop. Reston does not need two stops -- the Town Center stop will be sufficient. (0051 0052-1)

Response: *The Project Team will continue to coordinate with local residents, stakeholders, and local jurisdictions to preserve to the extent possible the integrity of each community along the Dulles Corridor. See Chapter 11 for a summary of the extensive public participation process that has occurred to date.*

Public Comment: c. That Phase 1 will have no effect on community cohesion (e.g., at TABLE 2-2). This claim is particularly suspect, given the fact that a protracted construction project would ensue, with congestion before the buildout is completed as well as increased tolls on Route 267 then and thereafter forcing many cars to take alternative cut-through routes to and beyond Tysons Corner and Falls Church that inevitably will result in congestion on small, community-access routes as well as more traffic accidents on the hilly terrain where such roads are located. (0068 0173-19)

Public Comment: The new rail line will provide many more places to go by Metrorail, like Dulles airport and the many businesses at Tysons Corner, for area residents who will access the Metrorail system at the WFC station. Also, a primary route for residents of Falls Church and McLean to access the new rail line at the East Falls Church and new Tysons stations is via the intersection at Haycock Road and Great Falls Street. This intersection is already a bottleneck during rush hours, which creates a back up that encourages people to cut through our neighborhood streets. (0026 0027-11)

Response: *In the analysis conducted for the Final EIS, all neighborhoods within a half-mile of transit stations were analyzed to see if they would experience an increase in "cut-through" traffic or other traffic impacts due not only to construction of the LPA, but also due to the increase in traffic associated with continued growth and development. These traffic effects are not projected to impact community cohesion and social interaction, nor are other neighborhoods in the corridor projected to experience reduced community cohesion.*

Public Comment: Our community should get priority for mitigation because we will be subject to an unprecedented level of noise and visual pollution from two freeways, a Metrorail station, two intersecting rail lines, a large rail yard and a steeply curved aerial rail track with a steel and concrete bed all near homes. No other community in the entire metropolitan area is subject to this many sources of noise all together. (0087 0102-2) (0104 0121-2) (0099 0115-2) (0089 0104-2) (0026 0027-2)

Response: *The Draft EIS and Supplemental Draft EIS evaluated the potential for noise and vibration impacts and provided recommendations on potential mitigation strategies to avoid significant impacts. The Final EIS further refined the assessment of impacts and identified potential commitments to mitigate those impacts. See Chapter 4.7 of the Final EIS for the results of the noise and vibration analysis and the end of Chapter 4 for a summary of proposed mitigation measures.*

Issues Related to Impacts on Individual Properties

Public Comment: I would like to know exactly how the LPA will affect my residence. Will it change my street or nearby streets? The map does not go into detail as to where my house is in relation to the LPA. I want to know exactly how close the metrorail and metrorail station will [be] to my house. Please send detailed pictures or whatever you have by email. Thank you. (0002 0002-1)

Response: *The Project would be built in the median of the Dulles Connector Road, some distance from your house on Pimmit Drive. The first station in Tysons Corner, which would be near the Capitol One building, appears to be the station closest to your house. Fairfax County zoning map 40-1 would give you an idea of the distance between the Dulles Connector Road and your residence; this can be accessed on the Fairfax County web site, www.fairfaxcounty.gov.*

Tie-Breaker Station #2

Public Comment: We received the Draft EIS and we are apparently going to be one of the properties that will be adversely impacted by this project. We live at 1838 Baldwin Drive on the cul de sac where this Tie Breaker Station defined as B-2 TBS is to be constructed. What we want to know is what it is, how big a structure and will it extend beyond the present barrier wall. It would have been better if your document had contained some explanations of the components that appeared on the maps. People whose property will be impacted by these things have no idea what they are or what they look like. Looking at the red lines for B-2 on the map it appears that some components of the TBS will extend to the cul de sac. (0003 0003-1)

My wife and I will be attending the briefing on November 25th at the Mclean Community Center. We live at 1838 Baldwin Drive, where we and our neighborhood will be severely impacted by the present proposed plan. Hopefully at this meeting there will be better and more detailed information on what this "Tie Breaker Station (B2) is, what it will look like and why our entire neighborhood has to be disrupted by the proposed access from our now private Cul de Sac. (0003 0013-1)

The tie-breaker station which will be 25 by 50 feet, one story, will be placed effectively in our backyard since the sound wall put up by the FAA in 1980 was really put - - it was a setback from the property line, so we have a sense of where that is going to go. So we are going to have a station and a roadway. (0025 0065-2)

The aerial photo indicates that the roadway would bisect my backyard and it really should be put along the property line, parallel to and adjacent to, the property line and not straddling the property line which does greater damage to my neighbor. (0025 0065-1)

Everyone is very familiar with people who complain about "Not In My Back Yard," i.e., the "NIMBY" syndrome. However, for me this is a literal reality. I am a true NIMBY. As depicted in the aerial photo, the proposed roadway will bisect my yard, leaving my property on either side of the roadway. I ask that the roadway be moved so that it runs adjacent to and parallel to my property line. The roadway should NOT straddle the property line, since this is even more harmful to the neighborhood. Project officials should replace what is removed for construction, e.g., as trees, structures, etc. In other words, make the land "whole." (0025 0026-1)

Public Comment: The Station, as depicted, will be situated between the wooden fence and the Dulles Connector Road, directly behind my house. The Station will be a one-story, brick structure that will be visible from the back of my house. Currently, our view is of trees and of the wooden sound wall that separates the neighborhood from the Connector Road. The visual impact of the Station will adversely affect the unobstructed view that we have enjoyed for many years. (0025 0026-2)

> ***Response:*** *A typical tie-breaker station is approximately 45 feet by 20 feet and about 13 feet high. Tiebreaker stations are usually located at crossovers in the rail tracks, and sometimes require an adjacent remote train control room that is approximately 20' by 20'. They break the rail line into sections, allowing power in one or more sections to be shut down for maintenance without affecting the power supply to the rest of the system.*
>
> *The Project Team has recommended Option A as the location of TBS-2. The implementation of the Project Team's detailed recommendations should mitigate any effect of TBS-2 on residential property values. DRPT will compensate the owner of 1836 Baldwin Drive for the permanent easement for the access driveway and apron at fair market value. TBS-2 itself will be located within the existing public right-of-way for the Dulles Connector Road.*
>
> *The Team recommends that that a new wooden noise wall surround the TBS-2 for its security, for enhanced community safety and for the aesthetics of the neighborhood. Since TBS-2 would not be visible from the Baldwin Drive neighborhood, it would not receive any architectural treatment. The new wooden noise wall would have doors at the location of the doors of the TBS-2 and the remote train control room. The height of the new wooden noise wall would be sufficient to screen the TBS-2, which has a height of 13 feet.*

The roadway in question is a narrow access driveway used to bring maintenance workers and equipment up to the adjacent tie-breaker station. It was located to minimize impacts to the two adjacent properties. As currently planned, the location of the access driveway and any temporary construction easement will be fully within the property of 1836 Baldwin Drive. The centerline of the access driveway will be parallel with the property line between 1836 and 1838 Baldwin Drive. The driveway and apron of TBS-2 might be of alternate materials, such as geo-grid or open concrete block with grass turf in their cells; the type of materials will be determined during preliminary engineering and final design. During the same phases, the drainage of the TBS-2 site, including its driveway and apron, will be addressed. Specific arrangements regarding landscaping and mitigation of construction impacts will be addressed with affected property owners.

Protecting Quality of Life

Public Comment: I recognize the Project as a potential asset to the greater community and appropriate to and reflective of the growth experienced in the immediate and surrounding regions. However, I do not want to see an end result that is corrosive to the quality of life that has become emblematic of our community.

My challenge to the Dulles Corridor Rapid Transit Project is that you be sensitive to the anticipated impact of the project on my community as well as the surrounding residential communities that share our concerns. Moreover, I challenge the Project and DRPT specifically, to champion our noise/visual concerns as you deliberate these and other matters with the many authorities that you interact with as you progress your agenda rather than simply direct us to some other agency. As the single entity closest to the proposed rail link development, the Dulles Corridor Transit Project has a singular opportunity to step up as an ally and champion of impacted residents. I see this as a course far preferable to the alternative of failing to act proactively to protect the quality of life enjoyed in the community you have pledged to serve. (0014 0015-4)

Public Comment: Again, we support the potential benefits of this project, given the over-development of this region, but we urge you to simultaneously protect the property values and quality of life of we longtime and preexisting area residents. (0017 0018-2)

Response: *The Project Team will continue to coordinate with local residents, stakeholders, and local jurisdictions to preserve to the greatest extent possible, the integrity of each community along the Dulles Corridor.*

Need to Mitigate Community Impacts

Public Comment: We support the underground construction option mentioned on p. 6-25 for the track leading from the WFC rail yard to the Dulles Connector Road median.

Mitigation such as sound walls and traffic calming falls under the jurisdiction of state and local transportation agencies, although transit agencies are causing the impact. Each is only responsible for either road or train noise, but to our community, it is just noise. We expect someone to fix it, and we expect someone to find the budget to pay for it. (0026 00)

Response: *The estimated noise effects of the project are described in Section 4.7 of the Final EIS. Currently, conventional highway noise walls barriers are not proposed along the Dulles Connector Road or the Dulles Toll Road as part of the project. Three-foot parapets or track edge barriers are the standard used for aerial Metrorail guideway sections, although four- and six-foot parapet barriers are proposed, as mitigation is some areas where exceedances of FTA noise criteria are expected. The types and location of the recommended mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b in the Final EIS are included*

to help identify the location of the proposed four- and six-foot parapet barriers closest to your street.

Public Comment: We ask that the Final EIS add mitigation for any construction impacts for Westhampton. (0026 0027-9)

Response: *The Final EIS specifies mitigation measures that could be used throughout the corridor. Along all sections of the Dulles Corridor, every effort would be made to mitigate construction impacts to businesses and residences during construction periods. DRPT will maintain ongoing communication among all public and private stakeholders throughout the implementation of the project in order to minimize construction effects. Prior to any construction activities taking place, specifications regarding the practices to be undertaken to mitigate potential impacts will be developed. These practices will also be monitored during construction as well to assure compliance.*

Public Comment: Post-construction study of noise, visual and traffic impacts on neighborhoods and contingency funds to pay for additional mitigation if impact is greater than anticipated. (0087 0102-10) (0089 0104-10) (0099 0115-10) (0104 0121-8)

Response: *Visual, noise, and traffic impacts of the LPA are assessed in Sections 3.4, 4.7, and 6.2 of the Final EIS. In these sections, the impacts are identified and proposed mitigation measures available to reduce unavoidable impacts are discussed.*

3.3 Property Acquisition and Displacement

A. Draft EIS Comments

Federal Agency Comments

Residential Displacement

Federal Comment: The environmental impacts are less than the typically more environmentally damaging highway improvements. For example this project is projected to move up to 87,000 riders a day by 2025 with no residential displacements. (0303, 0303-A –3)

Response: *Comment noted. Due largely to the use of existing transportation rights-of-way, minimal impacts are projected.*

Compensation for Acquired Properties

Federal Comment: According to FAA policy, FAA would be required to obtain fair market value in compensation for any airport property used for this project. This policy applies to the DAAR and any stations or other facilities that would be located on airport land. (0485 03-01)

Response: *DRPT will continue to coordinate with MWAA and FAA to determine an appropriate methodology for valuation of property required for the Project and the most appropriate legal mechanism for property conveyance. According to FAA policy, "Airport property can be made available at less than fair-market value for public transit terminals, rights-of-way, and related facilities without being considered a violation of federal statutes governing airport finances if (a) the transit system is publicly owned and operated and (b) the facilities are directly and substantially related to the air transportation of passengers or property. A lease of nominal value would be consistent with the requirements for airports to be self-sustaining."*

Public Comments

Compensation for Acquired Properties

Public Comment: Commenter just learned that his property would be taken as part of the north entrance pavilion for the Tysons Central C Station for the Locally Preferred Alternative. Believes that the company would receive little, if any, compensation and that he would not be able to find affordable property, or property that is zoned for a tire and auto store. (0498 3-01)

> **Response:** *As discussed in Section 3.3 of the Final EIS, all federally funded actions are required to meet certain standards for the fair and equitable treatment of persons displaced by those actions. Relocation assistance will follow the guidelines set forth in Title 49, Part 24 of the Code of Federal Regulations (49 CFR Part 24).*

Property Acquisition Concerns

Public Comment: Requesting that the location of the north entrance pavilion for the Tysons Central C station be moved from the Merchant's property. (0498 3-02)

> ***Response:*** *The proposed location of the north entrance pavilion for the Tysons 123 Station (formerly Tysons Central C Station) was developed to be consistent with the transit-oriented development goals of Fairfax County and trackwork alignment geometry for the Metrorail Extension. However, potential adjustments could occur during preliminary engineering and final design. The proposed Metrorail Extension alignment and facilities can be viewed in the final General Plans (Final EIS Volumes IV and V).*

Public Comment: One acre of their land will be acquired for a storm water retention pond. The commenters feel that their comments were merely acknowledged and not completely addressed because they feel that their lives will be changed in a drastic manner. (0383 03-01)

Public Comment: Oppose the proposed acquisition of one acre of their land for the construction of a stormwater retention pond. They suggest that a present noise problem would be exacerbated with the proposed construction of the retention pond, which would cause the destruction of at least 100 mature hardwood trees that provide auditory and visual buffers to the Dulles Toll Road. (0383 03-02)

> ***Response:*** *The locations shown in the final General Plans for Best Management Practice (BMP) and Stormwater Management (SWM) ponds throughout the corridor are approximate and were included to illustrate that a potential need for one of these facilities exists in the vicinity of the location shown. During preliminary engineering, a comprehensive drainage study will be undertaken for the entire corridor to address final locations of all BMP and SWM ponds. This effort should result in some facilities being eliminated, consolidated or relocated to further minimize impacts to the adjacent areas. Any acquisition required will be consistent with the Real Property and Relocation Assistance Act: Title 49, Part 24 of the Code of Federal Regulations (49 CFR Part 24).*
>
> *The proposed pond location in question currently is a natural depression with a culvert outfall. If a pond were constructed in this location, little or no grading would be required to convert existing depression into a stormwater management facility. It is unlikely that many of the trees would need to be removed.*

B. Supplemental Draft EIS Comments

<u>Local Agency Comments</u>

Magnitude of Impacts

Local Comment: Table 3.3-1 seems to have an error in the LPA Phase I (2025) and LPA Phase 1 (Opening Year) columns; Since Phase I will impact fewer properties than the Full LPA, the acreage impacted should be notably less than 139.3 acres. (0093 0109-13)

> ***Response:*** *This table has been corrected in the Final EIS. The Full LPA) would require approximately 32 acres of private property and 166 acres of government-owned or proffered property. The Wiehle Avenue Extension (formerly LPA Phase 1) would result in approximately 18 acres of private property and 15 government-owned or proffered properties. Additional information on property acquisition and displacements is provided in Section 3.3 of the Final EIS*

Public Comments

Property Acquisition Concerns

Public Comment: By this letter, I would ask that you confirm your intention (the authority's intention) to take the building at the corner of Gosnell and Leesburg Pike which The Business Bank currently occupies. We would not object to the placement of a transit system that would not result in a taking of the building. We strongly object to the proposed taking of our building. The taking of our headquarters building would result in a profound diminishment of our business and severely restrict our ability to serve our customers.

For these reasons, I formally ask that you revisit your plans such that they do not necessitate the taking of the building located at 8399 Leesburg Pike, Vienna, Virginia. On behalf of Building owners, The Board of Directors of United Financial Banking Companies, Inc. and The Business Bank, I thank you in advance for favorable consideration of our request to construct the underground rail by some other means than "cut and cover".(0148 03-01s)

> ***Response:*** *The Acquisition List of the Project does not include this property as a relocation. The Property Identification Plans do not show the bank building within a permanent easement. However, the construction of the underground Metrorail line will place its shoring of line of influence alongside the building; therefore, there will be construction effects upon the bank. The construction effects and the concerns of the property owner will be addressed during preliminary engineering, when construction methods, limits of construction, lines of influence, and a right-of-way acquisition plan are developed.*

Magnitude of Impacts

Public Comment: The SDEIS seems to indicate that 11 additional commercial properties need to be acquired in a phased project, vs. a non-phased project. This increment needs to be explained and assessed. (0068 0173-26)

> ***Response:*** *The change in effects identified in the Supplemental Draft EIS of 11 additional commercial properties refers to the difference in effects estimated for the Metrorail Alternative (T6/Y15) that was evaluated in the Draft EIS, as compared to the effects estimated for the Full LPA evaluated in the Supplemental Draft EIS. These changes are primarily due to changes in the design of proposed station facilities. See Section 3.3 of the Final EIS for a discussion of anticipated acquisitions.*

Impacts on Businesses

Public Comment: I don't believe this plan could have affected one business better in a more disastrous way than if it had tried. Not only will it eliminate an entire business, but it will disrupt all three locations. There will be impairment and blockage of ingress and egress of the two businesses on the south side of Route 7. It will take a significant portion of the Aston Martin lot and there is potential encumbrance of ingress and egress on the Mercedes lot. Now, all of this impact in this area for this West Tysons Station is focused one business, HBL. (0070 0079-1)

Public Comment: 3. A Bus transfer location at the Route 7 frontage removes prime commercial property. In the case of the Parcel 55 in the northeast quadrant of Route 7, the existing C-7 zoning allows commercial uses and is the location of the new Porsche-Audi, just opened last month and the site is completely within the County Highway Overlay District. (0053 0054-2)

Public Comment: Taking the entire Porsche-Audi lot on the northwest corner will eliminate between 100 and 150 jobs. It will eliminate nearly $4 million in tax revenues for the Commonwealth of Virginia and Fairfax County. It will eliminate approximately $100 million in business activity in the Tysons area. (0070 0079-2)

Public Comment: HBL operates three automobile dealerships at the corner of Tyco Road and Route 7, and under an L-shaped walkway plan proposed under the supplemental draft EIS, one HBL business would be completely closed. Portions of the other two may be taken, and both of those businesses would face serious impacts or disruptions at a significant loss of between 100 and 150 jobs over $100 million in business activity, and approximately $3-to-$4 million in lost state and local tax revenues. (0070 0138-1)

> ***Response:*** *For Tysons West Station entrance and facilities, the Project Team recommended, and the decision-makers selected Option E site plan to replace the plan presented in the Supplemental Draft EIS and revised General Plans. Option E has its station entrance at the inbound, east end of the station near Spring Hill Road. The bus bays and Kiss & Ride of Option E are located between Tyco Road and Spring Hill Road, set back from Route 7.*
>
> *Displacement impacts of the Full LPA are discussed in Section 3.3 of the Final EIS. The Project Team will work with the property owners to minimize impacts to the extent possible, while providing the necessary space required for station facilities. Upon completion of a more detailed design for the project, a comprehensive relocation plan would be developed to ensure that the orderly relocation of all displaced businesses would be accomplished. Relocation assistance would be available to all residential, business, and nonprofit entities and individuals that would be displaced, without discrimination.*

Public Comment: As owners of the above-referenced property, along with the tenant on the site, TBC Corporation, trading as Merchant's Tire, we wanted to express our opposition to the proposed plan for the total taking of the property before the following options are carefully considered: 1. The entrance pavilion shown on our site comprises a foot print of 75' x 90' or 6,650 square feet being approximately 25% of our total lot. There is a grassy area to the west of our lot that is a set back or green area for the neighboring property (SAIC). This grassy area measures approximately 50' x 60' or 3,000 square feet. By shifting the entrance pavilion into this unimproved grassy area, it would reduce the area required on our lot by 10% allowing our lot to still be functional. It could possibly be expanded further if the taking went into a row of parking that abuts this area. Utilizing this undeveloped area makes sense economically and logistically. (0092 0108-1)

Public Comment: 2. There is a 20' outlet road on the east side of our site, one half of which is on our property. This road gives access to the property behind ours. We could possibly utilize this as a new access into our property should we need to give up our existing entrance. As per discussions with the tenant, they would like to continue operating there and they feel the loss of a portion of the front area and existing access would not greatly impact their ability to continue to conduct business. They are willing to discuss limiting any claim for damage from any partial taking once the exact amount of the taking is determined. (0092 0108-2)

Public Comment: 3. There needs to be a thorough exploration of the possibility of switching the entrance to the west side of the platform which I understand has been requested by the owner of that property. (0092 0108-3)

> ***Response:*** *The proposed location of the north entrance pavilion for the Tysons 123 Station (formerly Tysons Central C Station) was developed to be consistent with the transit-oriented*

development goals of Fairfax County and trackwork alignment geometry for the Metrorail Extension. However, potential adjustments could occur during preliminary engineering and final design.

DRPT will work with the property owners and tenants to minimize impacts to the extent possible, while working to provide the necessary space required for the station entrance, associated circulation, and maintenance access. The proposed Metrorail Extension alignment and facilities can be viewed in the final General Plans (Final EIS Volumes IV and V).

Public Comment: As the owner of the Property [Tysons Corner Embassy Suites Hotel], and having reviewed the SDEIS, attended the hearings, and otherwise kept abreast of developments, CGLIC has very serious and sincere concerns as to the Project, as presently proposed. Please note that a proposed portal is to be located immediately in front of/adjacent to the Property, and it is planned that the service road fronting the Property, and portions of the Property itself, are to be used/condemned for, among other things, construction easements. Accordingly, CGLIC expects the Project in its present form could have a very detrimental impact on the Property, its operations and its value both long term and short term, including without limitation negative impacts as to noise, access and diminished alternative access, ingress and egress, parking, appearance, business interruption, and reduced utility of the Property. (0106 0124-1)

***Response**: As currently shown in the General Plans, there would be access and visual effects to this property from the selected LPA. The analysis of visual and aesthetic conditions in support of the EIS considered the relationship of the Project to Tysons Corner as whole and Route 7 for its entirety. The analysis considered the types of viewers and their sensitivity to visual changes and also the degree of visual impact to these viewers. DRPT will work with the property owners to minimize impacts to the greatest extent possible, while providing the necessary space required for station facilities.*

Public Comment: Let me first state for the record that at no time before the issuance of the supplemental draft, which I believe was in October of 2003, did anyone approach me from Fairfax County, The Commonwealth of Virginia or WMATA to discuss the proposed taking of my property, the 4.59 acres on Sunset Hills Road that is currently Reston Business Park and Mini Storage. It came as a complete shock to me in late October when someone who had seen the draft EIS called to tell me that the Reston Business Park was scheduled for demolition. (0130 0165-1)

Public Comment: As we ultimately discussed when we me[t] on December 17, 2003, this is by far the most valuable property in the entire Wiehle area for several reasons:

1. The existing office warehouse and storage business that has been built up over the last twenty-eight years generates very high net operating income making it more profitable than other commercial uses along the corridor.

2. The comprehensive plan for area G-4 (see attached Exhibit A) allows for up to a 2.5 FAR for rail oriented mixed use development. As we have discussed, mine is the only property that can be zoned at these densities because it is not restricted by the existing covenants for the area along the corridor that is the Reston Center For Industry And Government (RCIG) (see attached Exhibit B). There must be a residential component of no less than forty percent (40%) to get to these higher densities and the RCIG covenants do not allow residential development of any kind.

3. The comprehensive plan calls for consolidation of parcels and we also own the adjoining property to the south known as 11417 Sunset Hills Road with land area of 72,986 square feet (see attached Exhibit C). This parcel fronts directly on The Dulles Access Road and the proposed ramp to the Wiehle Station. By combining these sites, a probable 2.5 FAR could be achieved on the over 273,000 square feet of land. This could translate to a high-density mixed-use project of almost 700,000 square feet- supporting the tax district, WMATA operations and fulfilling the vision of the community.

4. We currently have fourteen (14) businesses that operate from Reston Business Park and 600 self-storage units. This property has always been a significant asset to the community.

5. We have worked in a cooperative effort with the community and the Fairfax County Government for a substantial number of years to achieve the planning and development of this property as envisioned by the County's Comprehensive Plan. Our ongoing planning process will soon result in a rezoning application consistent the Comprehensive Plan, which we expect to be approved in the near future, consistent with the highest and best use of this very valuable property. We would hope that the specter of rail would not interfere with our plans that we have been developing for so many years.

In the final analysis this parcel is far too valuable to be used as a parking lot, temporarily or permanently. I look forward to working with you on the future of Wiehle Station. (0130 0165-2)

> ***Response:*** *With the exception of a new roadway connection to Sunset Hills Road, the Wiehle Avenue station facilities would be situated upon the Reston East park-and-ride lot owned by Fairfax County. The final General Plans do not depict use of the Reston Business Park for temporary park-and-ride facility during the construction of the Wiehle Avenue Station facilities. During the construction of those facilities, DRPT would, if necessary, locate temporary bus facilities and parking on an alternative, but economical, site. The Reston Business Park owner may elect to participate in a joint development proposal to include the station facilities.*

3.4 Visual and Aesthetic Conditions

A. Draft EIS Comments

State Agency Comments

Concern for Visual and Aesthetic Impacts

State Comment: Visual pollution and loss of privacy. Many houses along the rail line will be in sight of the elevated tracks and areas for bus parking and the train yard [Westhampton neighborhood]. (0386, 0386-E –4) (0398, 0398-L –4) (0399, 0399-L –4) (0403, 0403-L –3) (0412, 0412-L –4) (0415, 0415-L –4) (0416, 0416-L –4) (0430, 0430-E –4) (0431, 0431-E –4) (0438, 0438-E –4) (0442, 0442-L –4) (0465, 0465-L –4) (0466, 0466-L –4) (0467, 0467-L –4) (0469, 0469-L –4) (0422, 0422-E –2) (0421, 0421-A –13) (0470, 0470-L –4)(0471, 0471-L –4) (0473, 0473-L –4) (0474, 0474-L –4)

> ***Response:*** *With the Supplemental Draft EIS and revised General Plans (October 2003), the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road. Visual impacts in the Westhampton neighborhood associated with construction of the Metrorail Extension were considered and evaluated in the Final EIS. The Project Team will work with surrounding landowners and local government to integrate Project elements into the surrounding development.*

Regional Agency Comment

Visual Effects of Ancillary Facilities

Regional Comment: DEIS Section 3.4.3 on visual and aesthetic effects indicates that views of the IAD tower and Main Terminal from the Dulles International Airport Access Highway (DIAAH) would not be blocked by the east rail portal or by traction power substations; however, the DEIS does not discuss whether views would be affected by fencing or other barriers in the DIAAH median, particularly near Sully Road. (0440, 0440-A –5)

Response: *The Section 106 Memorandum of Agreement in Appendix F of the Final EIS describes the Project's adverse effect on the remaining historic "peekaboo" views of the main terminal control tower for approaching travelers from the Dulles International Airport Access Highway (DIAAH) and the mitigation measures. One measure is that the vertical profile of the Metrorail tracks and the concrete safety barrier will be constructed as low as practicable given site conditions to minimize any obstruction of these views of the main terminal control tower. Fencing and other facilities in the median at this location will be minimal and the fencing itself would be transparent to the viewer and should not affect the peekaboo view. Any further design refinements of the approach to the airport will be coordinated with VDHR and MWAA.*

Local Agency Comments

Mitigation of Visual Impacts

Local Comment: Mitigate visual impact of the construction of Dulles Corridor Rapid Transit Project by incorporating innovative design features, enhanced lighting, public art and green space. (0437, 0437-E – 10)

Response: *Proposed mitigation measures for visual effects are summarized in Section 3.4 of the Final EIS.*

Public Comments

Potential Visual Pollution

Public Comment: Apparently there has been little effort to deal with the visual pollution that will be caused by elevated tracks, bus parking areas, and train storage and inspection yards. (0432, 0432-E –1)

Response: *The Final EIS describes proposed measures to mitigate unavoidable adverse effects. Some of the mitigation techniques include working with property owners to re-establish landscaping removed for facilities and making alignment adjustments. Elements of the land use in the corridor allow for public art and green space and FTA requires 0.5 percent of the Project's capital cost to go towards public art. The final Team recommendations state: "With respect to Metrorail aerial structures, the Project Team should consider aesthetic designs that are compatible with the surrounding environment."*

In the final General Plans, the station architecture of the Dulles Corridor Metrorail Project incorporates WMATA's "New Look" design that is now being completed for New York Avenue Station, and the two stations of the Largo Extension. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures. These are systemwide "signature" elements that support a unified system identity as well as economical design and construction. The project is expected to maintain a high level of design quality through the use of a special architectural consultant during preliminary engineering and final design.

Concern for Impacts to Neighborhoods and Community Facilities

Public Comment: Requests that the Project Team project the visual impact and loss of privacy for the homes in the Westhampton neighborhood and implement solutions so that the trains are not visible from the homes. (0117 03-01)

Response: *With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road. Visual impacts in the Westhampton neighborhood associated with construction of the LPA are evaluated in the Final EIS. The Project Team will*

work with surrounding landowners and local governments to integrate Project elements into the surrounding environment.

Concern for Visual and Aesthetic Impacts

Public Comment: The Rotonda has over 1000 units and slightly less than 5% of the units back up to Westpark Drive. There is sufficient permanent vegetation in the form of mature White Pines to block the view of Westpark Drive for those on the first three floors of building 2 and the majority of the remaining units would have sufficient elevation to see over the proposed line. (0120, 0120-L –3)

Response: *It is assumed that the comment refers to Alignment T4 of the Metrorail Alternative. Alignment T4 was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comment: In addition, the rail solutions create a number of design and aesthetic issues of concern, particularly in Tysons Corner. (0139, 0139-T –2) (0139, 0280-T-2)

Response: *The Final EIS describes in detail the various aesthetic and visual issues associated with the elevated alignments and stations throughout Tysons Corner. Section 3.4 of the Final EIS outlines the visual impacts of the project, including those impacts that are predicted to occur in Tysons Corner. The chapter includes a description of physical changes, where visibility is at issue, the types of viewers involved, the viewers' sensitivity to the physical changes, and what the impact of the visual changes is anticipated to be. In addition, the final Team recommendations state: "With respect to Metrorail aerial structures, the Project Team should consider aesthetic designs that are compatible with the surrounding environment."*

Public Comment: The other negative component on this alignment [T4] was the visual and aesthetic impact of aerial tracks along Westpark Drive. It is unfortunate that the underground alternative of this alignment was eliminated from the EIS, as this would have been preferable. However, I believe that Lincoln at Tysons residents and other renters along Westpark will be best served by and will strongly support the aerial line, given the huge benefit of transit service next door. Furthermore, the negative impacts of an aerial alignment would not be eliminated with any other rail alignments, since each of the alternatives includes some aerial segments through Tysons. I would, of course, support reexamination of undergrounding a segment of this alignment if it became necessary to mitigate this impact. (0084, 0458-E –4)

Public Comment: In addition, we argue that the visual and aesthetic impact of aerial tracks along Westpark Drive applies to all four proposed alignments for Tysons Corner. While we would support further exploration of tunneling all or a portion of the T4 alignment, we believe that the positive gains of providing Metro access to ALL of Tysons Corner will far outweigh this perceived negative. (0455, 0455-L –4)

Public Comment: What will be the change in the aesthetic character of those communities and/or neighborhoods located along the corridor? (0147, 0459-L –12)

Response: *The Final EIS describes in detail the various aesthetic and visual issues associated with the elevated Alignment T6 and its aerial stations throughout Tysons Corner. Section 3.4 of the Final EIS outlines the visual impacts of the Project, including those impacts that are predicted to occur in Tysons Corner. Alignment T4 was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. In addition, the final Team recommendations state: "With respect to Metrorail aerial structures, the Project Team should consider aesthetic designs that are compatible with the surrounding environment."*

Public Comment: Although we favor the metrorail option over the bus transit options for transit development on the Dulles Corridor, we are deeply concerned about the noise and visual impact to our community [Greenwich Street] that is directly adjacent to the proposed rail construction. Because our

neighborhood is below the grade of the proposed track site, and the rail is elevated, the effect for our homes in winter will be somewhat like living next to the monorail in a safari park. A visual barrier, such as a row of very tall evergreens (perhaps Norway spruce, white pine or other fast-growing, dense evergreen), strategically sited along the VDOT right-of-way is needed to separate the neighborhood from the transit route. (0389, 0389-E –1)

Public Comment: From what I understand of present planning, my neighbor, Scott Mays, eventually will endure the sight of an 8-car metro train, high in the air, whipping along at eye level every three minutes. His property is bounded by the sound barrier for the Dulles Connector Road…so the distance from his balcony railing to the metro rail action is only the length of his backyard, plus one half the width of the DCR. This situation = residences located below rail level = extends from approximately 745+00 to 785+00 on both sides of the DCR. Potential property buyers would have to weigh the convenience of having the West Falls Church Metro Station within walking distance against having the actual trains essentially in their back yards. Surely this would not be a positive sales feature and could only be a negative influence on property values. (0432, 0432-E –4)

> ***Response:*** *With the Supplemental Draft EIS and revised General Plans (October 2003) and as depicted in the final General Plans, the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road.*
>
> *Visual impacts in the Westhampton neighborhood associated with construction of the Metrorail Extension are evaluated in the Final EIS. In general, however, the Project Team will work with surrounding landowners and local government to integrate Project elements into the surrounding environment.*

Public Comment: The Reston area is rated in the draft (page 3-102, table 3.4-2) as that rail service will have "less than substantial visual impact." The rating neglects the fact that air rights and the adjacent Reston properties are planning to be of mixed use, including housing. In addition, the Rail Corridor will succeed in exacerbating the detrimental effects of the existing highway. Presently the highway includes some green landscaping that provides a modicum of relief from all the hot & noisy paving. Rail service will replace most of the green landscaping with the added noise, chain-link fencing, and that most ugly image of industry: railroad tracks. Most importantly, the combination of two highways and a railway will form a very formidable wall cutting Reston in two. We have the opportunity, instead, to use the rail service to improve the visual/aesthetic conditions and physically unite and encourage more efficient face-to-face interaction, by allowing more direct connections between north and south Reston. This can be accomplished by building the Reston stations below grade. (0441, 0441-E –3)

Public Comment: I submit that, based on the FHWA methodology, the route through Reston should be rated "substantial visual impacts" (see def. on page 3-71). Consequent mitigation should include grade cutting that places the Town Center and Wiehle Avenue stations (and highway) below grade. (0441, 0441-E –5)

> ***Response:*** *Chapter 3 of the Final EIS states that the actual physical change associated with the Metrorail Extension in the median will be minimal due to the removal of the landscaping for motorists, transit riders, and viewers in adjacent land uses, which would include any new residential development built as part of a mixed-use development. The stations were also determined to have a minimal impact since they are transportation facilities located within a transportation right-of-way and are not inconsistent in scale from the offices and major structures located on adjacent land uses.*
>
> *In the final General Plans, the station architecture of the Dulles Corridor Metrorail Project incorporates WMATA's "New Look" design that is now being completed for New York Avenue Station, and the two stations of the Largo Extension. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures. These are systemwide "signature" elements that support a unified*

system identity as well as economical design and construction. The project is expected to maintain a high level of design quality through the use of a special architectural consultant during preliminary engineering and final design.

The pedestrian bridges and stations are designed so that pedestrians may cross from one side of the corridor to the other without having to enter the stations and pay a fare.

Public Comment: As shown on Metro Alignment Exhibit T-4 (Exhibit C), the elevation of the first floor of 8484 Westpark Drive is at 472 feet, while the second floor is at 485 feet and the third floor is at 497 feet. As reflected in the August 27, 2002 letter from John F. Amatetti of VIKA, Incorporated (Exhibit D), "[t]he closest point between the road and building is approximately 84 feet. The distance from the existing wall and the edge of the rail is approximately 33 feet. …the elevation [of the T-4 alignment] at its closest proximity to the wall and building is at approximately elevation 490.00." At this point, the westbound track of the T-4 alignment is heading southbound on Westpark Drive, on a significant down gradient angle, and cuts sharply across the front of the property inside the curb line of the intersection. The train is an additional 11 feet above the rail, or elevation 501. This means that the rail and train will obscure the views of tenants located on the first, second and third floors of the building. Noise, vibration resulting from the short distance between the train, the retaining wall and the building pose serious economic concerns. (0461, 0461-E –3)

Public Comment: The building presently provides tenants with attractive surroundings at a prestige address conveniently located in the core of the Tysons Corner business center. These attributes enable Northwestern to successfully compete with similarly situated buildings in retaining and attracting tenants including, the high end restaurant and its customers. However, the eyesore of the above-grade alignment will so degrade the quality of the surroundings that this visual blight will obscure and overshadow any remaining positive attributes of the property, and will undermine the ability of Northwestern to retain and attract tenants. Because of the adverse impacts of visual blight, Northwestern will be forced to make significant financial concessions with respect to rates, tenant allowances and lease terms. The building's fair market value will decline substantially as a result of these financial concessions. (0461, 0461-E –4)

Public Comment: Apart from its ownership of its National Headquarters, NADA has a limited partnership interest in the Westpark Corporate Center adjacent to NADA's property. The visual impact from the immediate proximity of this segment of the T-4 alignment, coupled with the noise and vibration of the train, will invariably erode the value of NADA's investment in that property. As shown on Metro Alignment Exhibit T-4 Option, prepared by VIKA Incorporated and the NADA Impact Studies as set forth in five sketches prepared by VIKA Incorporated (Sketches), the horizontal proximity of the T-4 alignment to one of the Westpark Drive and Route 7 is about 33 feet from the existing wall and the edge of the rail. The foregoing Sketches show that the elevation of the first floor of the building is at 472 feet, while the second floor is at 485 feet and the third floor is at 497 feet. The rail elevation is at 490 feet. This means that the rail and train will obscure the views of tenants located on the first, second and third floors of the building. The noise, both during and after construction, will cause distraction. Vibration resulting from the short distance between the train and a retaining wall pose serious safety concerns. (0477, 0477-L –5)

Public Comment: The other source of visual blight upon NADA's headquarters is the above-grade alignment of T-4. As stated in the VIKA Incorporated letter dated August 27, 2002 (Engineering Report) "The first floor of the building is at elevation 502.00. The second floor is at 514.00. The third floor is at 526.00. Based on this, and the rail elevation of 530 feet, the views of most of the tenants on most of first, second, and third floors are obscured by the rail and train profile." (0477, 0477-L –7)

Public Comment: The Headquarters Building presently provides tenants with attractive surroundings at a prestige address conveniently located in the core of the Tysons Corner business center. These attributes enable NADA to successfully compete with similarly situated buildings in retaining and attracting tenants. However, the eyesore of the Substation and the above-grade alignment will so degrade the quality of the Headquarters' surroundings that this visual blight will overshadow any remaining positive attributes of the Headquarters property. (0477, 0477-L –9)

Response: *Alignment T4 was eliminated from further consideration after the public and interagency review and comment on the Draft EIS, due to its visual effects. However, the Locally Preferred Alternative (LPA) evaluated in the Final EIS includes four Tysons stations along Alignment T6. An assessment of project-related visual impacts is presented in Section 3.4 of the Final EIS.*

Public Comment: Aesthetics -- The appearance of the aerial structure and the aerial stations will have a tremendous impact on the ability of the Metro facilities to be integrated into the area aesthetically. Before the WMATA Board approves the Dulles line, the design configurations for both the stations and the aerial structures should be thoroughly vetted and approved by the community and the County. Obviously, little work has been done to date in this regard. For example, the engineering plans show one aerial structure configuration (similar to that used at National Airport and elsewhere on the Metro system), while the architectural drawings show a significantly different configuration, one that's entirely new to the Metrorail system. (0387, 0387-L –13)

Public Comment: General. The design of the aerial structure in the architectural plans does not match the design of the aerial shown with the alignment drawings. Is the design of the aerial structure as shown in the architectural plans even feasible? Which structure design will be used? Is there any difference in cost? (I would bet that there would be.) (0387, 0387-L –47)

Response: *The Project Team recognizes that the aerial guideway and stations are important visual elements that merit careful study and sensitive treatment. The final Team recommendations state: "With respect to Metrorail aerial structures, the Project Team should consider aesthetic designs that are compatible with the surrounding environment." This will occur during preliminary engineering and final design. The aerial guideway configuration has not been selected at this time; both configurations shown in the final General Plans are under consideration and both are structurally feasible. The cost difference between the two alternatives has not been determined. This selection will be based on an analysis of aesthetics, cost and structural performance.*

Public Comment: No specific information was provided on whether there were visual or vibration impacts and no commitments for mitigation were made. (0430 03-02)

Response: *With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road. Comments pertaining to potential visual impacts in the Westhampton neighborhood have been addressed in the Final EIS. Ground-borne vibration and ground-borne noise levels from activities at project facilities, such as a Metrorail Service and Inspection Yard, are expected to be well below the ambient background levels. Therefore, no exceedances of the FTA or WMATA impact criteria are expected.*

Public Comment: Additional study of the feasibility of running the feeder rail line to the West Falls Church S&I Yard underground near the Westhampton neighborhood to address visual and noise pollution concerns. (0500 03-01)

Public Comment: Additional study of the feasibility of running the feeder rail line to the West Falls Church S&I Yard underground near the Westhampton neighborhood to address visual and noise pollution concerns. (0501 03-01)

Response: *The planning for the connection to the Orange Line of the proposed Metrorail extension has always incorporated the use of at-grade and aerial methods of construction for connecting the flyover from the median of I-66 to the median of the Dulles Connector Road. Provisions for this connection were made with the original construction of the Orange Line in the early 1980s, including the construction of a pier and foundation in between the Orange Line tracks to facilitate such an aerial structure to minimize eventual disruption to the Orange Line during construction.*

The impacts and costs for underground construction of this connection were not evaluated as part of any current alternative in the Final EIS. Making this connection would present extremely complex construction challenges to keep the Orange line fully operational and not impact both directions of I-66, a major interstate highway. Due to its complexity, the cost of this underground construction for this segment would be significantly greater than typical cut-and-cover construction, and many times greater than the planned at-grade and aerial construction.

Public Comment: Concerned with visual and noise impacts since the community lies within 80 feet of the right of way, at the exact location where the Metrorail alignment would become elevated and curve into Tysons Corner. (0137 03-01)

Response: *Section 3.4 of the Final EIS describes in detail the various aesthetic and visual issues associated with the project. This chapter outlines the visual impacts of the LPA, including those impacts that are predicted to occur in Tysons Corner. In addition the chapter includes a description of physical changes, where visibility is at issue, the types of viewers involved, the viewers' sensitivity to the physical changes and what the impact of the visual changes is anticipated to be.*

Public Comment: Commenter says that Alignment T6 was recommended over Alignment T9 because it has less visual impact. Figure 3.4-7 in the Draft EIS conflicts with this reasoning. Figure shows that double column and extra track width of T6 has much greater visual effect than T9 for the entire length of the above grade section. Suggested architectural treatments do nothing to minimize shadow effect on the Route 7 corridor. This effect will have long term negative impact on property owners along the corridor, and will not balance the positives of increased transit options. (Bob Wilberg, Prentiss Properties)

Response: *In Section 3.4 of the Draft EIS, the visual impacts of the Alignments T6 and T9 alignments were listed as identical. Both alignments would have resulted in substantial visual effects to viewers such as motorists, transit riders, and office/commercial workers. These viewers have a moderate sensitivity to visual changes. Impacts to residents, who are more sensitive viewers but whose views are distant, would be less than substantial. With Alignment T6, the Tysons Central 7 Station is underground, while with Alignment T9; the Tysons Central C Station would have been high above ground and would have resulted in more visual effects. As shown in Figure 3.4-7 in the Draft EIS, the areas traversed by the aerial portions of Alignments T6 and T9 include relatively wide roadways surrounded by substantial office and retail development. The addition of an aerial transit alignment and stations would not be out of character with such areas and appropriate architectural treatments are planned.*

Public Comment: Concerned about direct effects on his property at 8521 Leesburg Pike. Transition from underground to aerial will cut off access to Route 7, and would relocate the service road into his front door. T6 will also have visual effects. (0488 03-01)

Response*: As currently shown in the General Plans, there would be access and visual effects to this property from Alignment T6 of the selected LPA. The analysis of visual and aesthetic conditions in support of the EIS considered the relationship of the Project to Tysons Corner as whole and Route 7 for its entirety. The analysis considered the types of viewers and their sensitivity to visual changes and also the degree of visual impact to these viewers.*

Mitigation of Visual Impacts

Public Comment: At any rate, what I wanted to say was in the statements that Mr. Dittmeier made, he mentioned that there were impacts and conflicts which were mitigated in the report. I wish to take exception to that. One of the statements in the report - I may be not exactly quoting verbatim, but it says that the aerial system will dominate the view from hundreds of apartments, many of them, hotel rooms, and certainly from office space. That's true. That is an impact. But it has not been mitigated in the report. (0160, 0160-T –1)

Response: *Alignment T4 was eliminated from further consideration after the public and interagency review and comment on the Draft EIS, in part due to its visual effects.*

Public Comment: Mitigation for visual pollution, such as additional and higher walls, tree plantings, and a structure to cover the rail line [near Westhampton]. (0386, 0386-E –8) (0398, 0398-L –8) (0399, 0399-L –8) (0403, 0403-L –7) (0412, 0412-L –8) (0415, 0415-L –8) (0416, 0416-L –8) (0430, 0430- E- 8) (0431, 0431-E –8) (0438, 0438-E –7) (0442, 0442-L –7) (0465, 0465-L –8) (0466, 0466-L –7) (0467, 0467-L –7) (0469, 0469-L –7) (0470, 0470-L –8) (0471, 0471-L –7) (0473, 0473-L –8) (0474, 0474-L –8)

Response: *With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road. Visual impacts in the Westhampton neighborhood associated with construction of the Metrorail Extension are evaluated in the Final EIS. The Final EIS states: "DRPT and WMATA would consider designs for Metrorail stations, aerial structures, and portals that are compatible with the surrounding environment."*

Public Comment: Use shrubs and trees to bring parking/storage/inspection/maintenance areas into harmony with residential areas. (0432, 0432-E-7)

Response: *The Project Team will work with property owners to re-establish landscaping removed for the construction of facilities and alignment.*

Public Comment: Visual pollution and loss of privacy at many of the houses in Westhampton due to elevated tracks, bus parking areas, and the train yard. Mitigation for visual pollution, such as additional and higher walls and tree plantings. (0483 03-01)

Public Comment: Visual pollution and loss of privacy at many of the houses in Westhampton due to elevated tracks, bus parking areas, and the train yard. Mitigation for visual pollution, such as additional and higher walls, tree plantings, and a structure to cover the rail line are needed. (0499 03-01)

Public Comment: Visual pollution and loss of privacy at many of the houses in Westhampton due to elevated tracks, bus parking areas, and the train yard. Mitigation for visual pollution, such as additional and higher walls, tree plantings, and a structure to cover the rail line are needed. (0500 03-02)

Public Comment: Visual pollution and loss of privacy at many of the houses in Westhampton due to elevated tracks, bus parking areas, and the train yard. Mitigation for visual pollution, such as additional and higher walls, tree plantings, and a structure to cover the rail line are needed. (0501 03-02)

Public Comment: Is concerned that the responses in the *Public Hearings Report* focused exclusively on adding rail to the median of the DAAR. Since their homes lie 20 to 30 feet below the level of the adjoining roadway, they will be exposed to both the sight and sound of the project. While the community supports the project and recognize its value, without mitigation, the Metrorail Alternative will substantially affect their quality of life. (0137 03-02)

Response: *With the Supplemental Draft EIS and revised General Plans (October 2003), the Project Team lowered the Metrorail profile such that the top-of-rail is, on average, 25 feet above the median of the Dulles Connector Road. Section 3.4 of the Final EIS describes in detail the various aesthetic and visual impacts associated with the Locally Preferred Alternative. The effects vary with respect to the type of visibility involved, the types of viewers involved, the viewer's sensitivity to the physical changes, and the level of physical change anticipated to occur. The final Team recommendations state: "DRPT and WMATA would consider designs for Metrorail stations, aerial structures and portals that are compatible with the surrounding environment."*

Opportunities for Aesthetic Enhancements

Public Comment: What we need here in Reston East is an inspired "gateway." (0072, 0072-CC-2)

***Response**: In accord with the final Team recommendations for Wiehle Avenue Station, the final General Plans include a site plan that accommodates future joint development at the station. The site of the joint development would be on the current Reston East park-and-ride facility along Wiehle Avenue.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.

While an "inspired gateway" is not explicitly part of the Metrorail Extension, it is possible that a joint development project at Wiehle Avenue Station could include "gateway" elements.

Need to Maintain and/or Improve Visual Quality of Area

Public Comment: County and Reston Center for government and industry architectural review priorities should be to maintain or improve the visual quality of the station areas. (0170, 0170-T –14)

Public Comment: County and RCIG Architectural Review priorities must be concerned about the visual quality of the station area. Reston is interested in innovative design of the corridor stations and measures that mitigate the visual impact of removing the grassy median and trees. (0233, 0426-M –10)

***Response:** The Fairfax County Comprehensive Plan is implemented through its Area Plans, which convey the Policy Plan's goals and objectives at the more-detailed Planning District and Community Planning Sector levels. The change in character at the transit stations is discussed in Chapter 5 of the Final EIS. The Fairfax County Comprehensive Plan includes several design guidelines for the Reston area to maintain or improve visual quality. These include guidelines on character and form, building design and height, access considerations, provisions to enhance the pedestrian environment such as the use of plazas and courtyards, subtle design features such as building facades and rooflines, and creating a sense of enclosure and defined space. Fairfax County and the Reston Association govern the refinement of design guidelines in Reston.*

In the final General Plans, the station architecture of the Dulles Corridor Metrorail Project incorporates WMATA's "New Look" design that is now being completed for New York Avenue Station, and the two stations of the Largo Extension. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures. These are systemwide "signature" elements that support a unified system identity as well as economical design and construction. The project is expected to maintain a high level of design quality through the use of a special architectural consultant during preliminary engineering and final design.

In addition, as discussed in Section 3.4 of the Final EIS, the removal of stands of trees from the median of the DIAAH would represent a minimal visual impact along the corridor.

Public Comment: Western Portal At Dulles Airport - The western rail portal at Washington Dulles International Airport should be moved to a point north of Rudder Road to preserve as much as possible the views of the historically-protected main terminal building [for T6]. It would also move the portal and the noise of the trains further away from the Dulles Airport Marriott hotel and its guests. (0071, 0214-M –7)

***Response**: With the Supplemental Draft EIS and revised General Plans (October 2003) the Project Team relocated northward the portal at the western end of the Dulles Airport tunnel so that the Project's effects on the Dulles Airport Marriott have been reduced. This relocation is part*

of the Full LPA and final General Plans.

The Section 106 Memorandum of Agreement, included as Appendix F of the Final EIS, describes the mitigation of the Project's effects on the Dulles Airport historic district. One mitigation measure is that "The design of aerial structures and portals located within the historic district boundaries will consider, and incorporate where appropriate, concepts and materials that are mutually agreed to be compatible with the historic terminal and other contributing elements of the historic district." Noise effects near the Marriott at Dulles Airport from Metrorail trains are not anticipated to exceed criteria require mitigation measures.

Public Comment: WATF welcomes the comments in Section 7.3.2 of the *Public Hearings Report* on page 595 regarding adequate landscaping and consideration to visual impacts. However, WATF believes that the responses should be strengthened and made a specific requirement for the project. Additionally believe that, project landscaping should be maintained as part of the project and should not be an airport cost. Believes good public architecture should be a requirement. (0133 03-01)

Public Comment: The WATF applauds the reduction in visual intrusion for aerial tracks reported in the revised DEIS, and urges project managers to continue to pay very careful attention to landscaping and architecture for the reasons stated earlier. In addition, good, well maintained landscaping and architecture can increase rider ship as some potential users take them as evidence of a safe and efficient system. Also, visual appeal saves money by generating good will and reduced complaints. (0108 0127-6)

Response: *Landscaping plans of station facilities will be developed during preliminary engineering and final design. In the final General Plans, the station architecture of the Dulles Corridor Metrorail Project incorporates WMATA's "New Look" design that is now being completed for New York Avenue Station, and the two stations of the Largo Extension. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures. These are systemwide "signature" elements that support a unified system identity as well as economical design and construction. The project is expected to maintain a high level of design quality through the use of a special architectural consultant during preliminary engineering and final design.*

Public Comment: Suggests depressing the rail line in a covered trench, as was done for Centennial Village near Addison Road on the Metrorail Blue Line. Believes that it is possible to cross under (instead of over) the two eastbound lanes of the Dulles Toll Road, and still be high enough to approach an elevated station at Tysons East. Suggests that it would be much more economical than tunneling, and that this cut and cover solution would be much better in terms of visual and noise impacts. (0137 03-03)

Response: *Placing the Metrorail Extension underground between the Dulles Connector Road and an aerial Tysons East Station presents several difficulties, foremost cost, which would be many times more expensive than the approved aerial segment. The Tysons East Station and adjacent alignment was carefully located horizontally and vertically to work in concert with current and future land-use and roadway plans for this area*

Importance of Neighborhood Compatibility of Stations

Public Comment: I would also like to make the following suggestions: Every effort should be made to provide high quality stations with ample parking to help ensure that the stations are not only convenient, but attractive additions to the surrounding neighborhoods. (0393, 0393-L –3)

Response: *In the final General Plans, the station architecture of the Dulles Corridor Metrorail Project incorporates WMATA's "New Look" design that is now being completed for New York Avenue Station, and the two stations of the Largo Extension. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis*

on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures. These are systemwide "signature" elements that support a unified system identity as well as economical design and construction. The project is expected to maintain a high level of design quality through the use of a special architectural consultant during preliminary engineering and final design.

B. Supplemental Draft EIS Comments

Public Comments

Potential Changes in Character of Neighborhoods

Public Comment: We anticipate the adverse visual impact of the rail link as described in current planning documents. While no longer raised as it passes by our immediate community, even the at-grade rail bed will have a visual impact due to the fact that we do not have the benefit of neither noise abating nor privacy fencing. I envision the effect to something akin to turn-of -the century New York City rail systems or current day "El" in downtown Chicago - neither of which is what my family and neighbors envisioned when acquiring our otherwise bucolic setting where we make our home. (0014 0015-2)

Response: *Comment noted. Chapter 3 of the Final EIS describes the visual effects of the Project and its effects on neighborhoods.*

In regards to the absence of conventional highway noise walls, the final Team recommendations state "With respect to the concerns of communities on the noise of the Dulles Connector Road, the Commonwealth of Virginia will seek to address the existing noise effects upon the residential communities with noise abatement measures. If the Commonwealth decides to proceed with noise abatement measures, it would bear most of the cost of the abatement, since this is an existing condition due mainly to traffic to and from the Dulles Toll Road. The Project itself would share in the cost of abatement proportional to the Project's contribution to the future levels of noise and to its visual effects. DRPT has been identified as the lead agency for the coordination among VDOT, MWAA, WMATA, FTA, Fairfax County officials and staff, and representatives of the affected communities."

Public Comment: The SDEIS needs to evaluate visual effects throughout the entire corridor and its affected environs, not merely in Tysons Corner, the W&OD Railroad Regional Park and the Dulles Airport Historic District (e.g., at TABLE 2-2). The evaluation needs to include not only an operational metrorail system, but also years of construction, resulting gridlock and the likely increase in traffic along arterial routes as drivers avoid the increased tolls due to this project. (0068 0173-27)

Response: *Section 3.4 of the Final EIS provides a visual analysis of the entire Project corridor, including a description of the existing visual character, quality of views, and important visual resources along the corridor; an assessment of the project's potential impacts on these resources; and a discussion of proposed mitigation measures in areas where any substantial impact was determined to possibly occur. The final Team recommendations state: "DRPT and WMATA would consider designs for Metrorail stations, aerial structures and portals that are compatible with the surrounding environment."*

Public Comment: n. The SDEIS needs to provide detailed explanation as to what is contemplated in the contention that east of Wiehle Avenue a change in visual character at stations will result (e.g., at TABLE 2-2). This explanation needs to be detailed in respect of both geographic extent – how far east? – and the type of visual character change anticipated in order for the public to be adequately informed for purposes of public comment. (0068 0173-31)

Response: *The Final EIS states that the visual impact of the project in the Tysons Corner area would be reduced relative to the impacts described in the Draft EIS. Based on comments received during the Draft EIS process, a segment of the proposed alignment immediately west of*

the Route 123/Dulles Connector Road interchange was revised to reduce visual impacts. By shifting a portion of the proposed alignment to the north side of Route 123, a series of structural bents for a lengthy oblique crossing of aerial structure over Route 123 was eliminated.

Public Comment: While your report states in Section 3.4.3 that "neither the proposed LPA nor the proposed LPA Phase I would result in any substantial visual impacts to resources along the corridor." As one of those "resources," our community will be exposed to 8 car trains running at speed (or braking) at a height of 52 feet over the level of our homes as they curve into Tysons. (0036 0037-2)

Public Comment: Second, the visual impact of the elevated and curved rail line at our location should also not be overlooked. While your report states, in Section 3.4.3, that "Neither the proposed LPA nor the proposed LPA Phase 1 would result in any substantial visual impacts." We feel that we will be impacted by that as we are exposed to eight-car trains running at speed or braking at a height, as I understand the profile, of about 52 feet over the level of our homes as they curve into Tysons. (0036 0062-2)

Response: *Potential visual impacts of the LPA are discussed in Section 3.4 of the Final EIS and noise impacts are discussed in Section 4.7. Proposed mitigation to alleviate potential impacts is discussed at the end of each section and summarized for all impact areas in Chapter 2. DRPT will continue to communicate with residents of the Hallcrest Heights neighborhood and other adjacent property holders throughout preliminary engineering and final design to address neighborhood concerns.*

3.5 Cultural Resources

A. Draft EIS Comments

State Agency Comments

Section 106 Process

State Comment: We are currently working with the FTA, USDOT, VDRPT, WMATA, the FAA, and their consultant, Parsons Engineering Science, Inc., on the identification of historic properties within the proposed transportation corridor. Currently, Parsons is drafting a Programmatic Agreement among the federal and state agencies and our department. This programmatic agreement will outline the procedures to be followed in the identification and evaluation of historic properties as well as plan for the mitigation of effects to properties eligible for listing on the National Register of Historic Places. We encourage the federal and state agencies involved to continue coordinating with our office as the project evolves. (0407, 0407-A –40)

State Comment: Historic Structures and Archaeological Resources. The Department of Historic Resources indicates that it is working with project management agencies and their consultant on the identification of historic properties in the proposed corridor. The agencies involved will sign a Programmatic Agreement with the Department of Historic Resources which outlines procedures for the identification and evaluation of historic properties and plans for mitigation of effects upon properties listed on or eligible for the National Register of Historic Places. We encourage the agencies involved to continue coordinating with the Department of Historic Resources as this project evolves. (0407, 0407-A – 7)

State Comment: Cultural Resources Technical Report - (June 2002)

§ As stated in previous comments, this study has not established which resources previously identified are in fact eligible for the National Register. This is a fundamental flaw. There are clearly a number of resources previously documented within the APE (for example Bois de Gosses, Shiloh Baptist

Church, Plantation, Wiehle/Sunset Historic District, etc) that have not been evaluated by the FTA or VDHR. Comments on eligibility for each resource need to be obtained from VDHR.

- § Without knowing which resources are eligible for listing in the National Register, an effect determination cannot be made.
- § Without knowing which resources are eligible and what their boundaries are, Section 4(f) evaluations cannot be made.
- § If documentation is provided by the FTA (or their consultants) to VDHR, several of the resources may well drop from consideration in the context of Section 106. There appear to be very few resources that will be eligible for listing in the National Register.
- § The report states on page 111, that additional architectural resources may exist beyond those previously documented. This is a potentially fatal flaw in the study. If there are other eligible historic properties they need to be identified now. Their location may well effect a location decision (via Section 4(f)).
- § Page 111 - Archaeological survey needs should be depicted on maps. (0421, 0421-A –8)

State Comment: To date the Section 106 process has not been initiated. Other than the meeting on held on February 28, 2001, agency has not received any information regarding NHPA compliance. Understand that the identification of previously identified historic properties is well under way and that the identification of previously unidentified properties will begin in the near future. (0516 03-01)

> ***Response****: Appropriate coordination regarding the Section 106 process continued through the development of the Final EIS. The executed Section 106 Memorandum of Agreement is included as Appendix F of the Final EIS. Additional information on impacts to the Dulles Airport historic district is included in Chapter 7 of the Final EIS (Section 4(f) Evaluation).*

Regional Agency Comments

Need for Appropriate Mitigation

Regional Comment: As the development of the IAD Metrorail station would occur below grade, it would not have direct visual impact on the Main Terminal or historic district; however, this new facility would still technically fall within the historic district and the architectural design would need to take into account the general historic character of the airport. The original Saarinen plan included a careful consideration of both the inbound and outbound "passenger experience." As the new facility will become a new element of that experience, architectural sensitivity to the character of the airport will need to be addressed. Further consultation with the Airports Authority and the review agencies (under the terms of a Programmatic Memorandum of Agreement) would be required to assess potential effects and develop mitigation measures (if required). (0440, 0440-A –7)

Response: *The Section 106 Memorandum of Agreement, included as Appendix F of the Final EIS describes the mitigation of the Project's effects on the Dulles Airport historic district. Per the terms of that agreement the design of the Dulles Airport Metrorail station and terminal connections will consider, and incorporate where appropriate, established airport design themes and finishes within the context of the WMATA design criteria, approved system-wide facility requirements and operational practices in effect at the time of the design. In addition, the design of aerial structures and portals located within the historic district boundaries will consider, and incorporate where appropriate, concepts and materials that are mutually agreed to be compatible with the historic terminal and other contributing elements of the historic district.*

Boundaries of the Washington Dulles International Airport (IAD) Historic District

Regional Comment: The eligible historic district at IAD is substantially larger than that shown in Figure 7.3-1b, and includes the proposed location of the rail tunnel portal and elevated track northwest of the Main Terminal. The effects of these structures need to be addressed in the context of cultural resources and the Section 4(f) evaluation. (0440, 0440-A –6)

***Response*:** *Further coordination occurred during the preparation of the Final EIS and Section 106 Memorandum Agreement to confirm the boundaries of the Dulles Airport historic district. Additional information on impacts to the Dulles Airport historic district is included in Section 3.5, Cultural Resources, and Chapter 7 (Section 4(f) Evaluation) and Appendix F (Section 106 MOA) of the Final EIS.*

Local Agency Comments

Concern for Impacts to Previously Identified and Potential Cultural Resources

Local Comment: From the standpoint of this office, site 44FX1569 is of particular interest from an overall resource planning perspective. The site was subjected to a phase 2 assessment in the 1980s. The results were conclusive from a functional standpoint but without chronological data the functional data is largely worthless. To justify the phase 2 cost to the public this situation should be rectified. I urge the oversight agencies to build additional phase 2 testing or construction monitoring into the plans for any construction that will destroy this site. Arrangements can be made with FCAS for this archeological work. (0306, 0306-A –8)

Response: *As noted in Section 3.5 of the Final EIS, the referenced site underwent Phase II testing in 1989 during studies related to the Dulles Toll Road Extension. The site was determined to be eligible for the NRHP and Phase III testing was recommended, prior to construction. No record of Phase III excavations was found. No impacts to this site are anticipated to occur as a result of implementing the LPA. In addition, this site as well as the other archaeological sites within the Area of Potential Effect (APE) for the project would be avoided in siting construction staging areas. Therefore, no testing at Site 44FX1569 is warranted as a part of this project.*

Local Comment: The Cultural Resource Protection Group (CRP) of the Fairfax County Park Authority has reviewed the alignments for the Dulles Rapid Transit Corridor. Construction along this corridor will impact six parks owned by the Fairfax County Park Authority. The parks included in this assessment are Scott's Run, McLean Hamlet, Ashgrove, Difficult Run, Olney and Hutchison School Site. A number of important archaeological resources were found to exist in these parks. Important sites found within the parks include 44FX 2470 (Odrick Site), 44FX1597 (Ashgrove and other related sites, including 44FX2205 and 44FX2203). The CRP recommends complete avoidance of these sites. All of these sites are important to the history of Fairfax County, and as such, deserve special attention. (0306, 0306-A –5)

Response: *All resources potentially affected by the LPA were identified in the Final EIS. See Section 3.5, and Chapter 7for a discussion of historic resources and anticipated effects.. Mitigation commitments for adverse effects to historic properties are detailed in the Section 106 MOA (Appendix F).*

Local Comment: As noted on the figures from County Archaeological Services, areas of moderate or high potential for archaeological sites should also be surveyed prior to any construction. (0306, 0306-A –6)

Response: *Areas with moderate or high potential for archaeological sites within the APE of the LPA were investigated and discussed in the Final EIS. No effects to archaeological resources are anticipated. The Section 106 Memorandum of Agreement in Appendix F of the Final EIS discusses the mitigation of one adverse effect to a historic property.. See Section 3.5, Chapter 7, and Appendix F (Section 106 MOA) for a discussion of all potential impacts and mitigation measures associated with cultural resources.*

Coordination with Local Entities

Local Comment: Areas of cultural and historical resources were identified in the DEIS primarily based on information provided by the State Historic Preservation Officers (SHPO). To augment the information provided by the SHPO, we have attached an archeology impact assessment, analysis and

recommendations from the County Archeologist and FCPA Cultural Resource Protection Group. Please note that the County Archeologist has offered to assist in any archeological work that may be undertaken. (0306, 0306-A –2)

> ***Response*****:** *See Section 3.5, Chapter 7, and Appendix F (Section 106 MOA) for a discussion of all potential impacts and mitigation measures associated with cultural resources.*
> *. The Project Team will continue to coordinate with VDHR, the County Archaeologist, and the FCPA Cultural Resource Protection Group throughout preliminary engineering and final design.*

Public Comments

Concern for Impacts to Previously Identified and Potential Cultural Resources

Public Comment: The Draft EIS makes the common mistake of presuming that adequate cataloguing has occurred with respect to archaeological and architectural resources so that planners would have advance knowledge of any adverse impact. Based on recent experience, adequate cataloguing has not taken place and resources have been destroyed. The project should not further this loss. (0510 03-02)

> ***Response:*** *As described in Section 3.5 of the Final EIS, identification of historic and archaeological resources was conducted in accordance with applicable laws and regulations. The Project Team continued to coordinate with VDHR, the County Archaeologist, and the FCPA Cultural Resource Protection Group throughout preparation of the Final EIS to ensure that all resources were identified. .*

Public Comment: How will the new traffic patterns and traffic volumes generated by this project affect the scenic and historic character of Hunter Mill Road, which was declared eligible for listing as an historic district in state and national historic registries in 2002 and has been named a Virginia Byway? (0460, 0460-L –3)

Public Comment: The Draft EIS does not recognize that the Hunter Mill Road corridor was declared eligible for listing as a historic district in 2002 and has been named a Virginia Byway. The impact that the proposals would have on this resource should be assessed. (0510 03-03)

> ***Response:*** *. The proposed Hunter Mill Road historic district was included in the assessment of effects to cultural resources in Section 3.5 of the Final EIS. No effects from the Project are projected for communities in proximity to Hunter Mill Road. The increase in densities allowed by Fairfax County is also not anticipated to occur within these neighborhoods.*

Need for Section 106 Review

Public Comment: Finally, the Westhampton neighborhood, which is a 50 year-old subdivision would experience a significant architectural impact from the development of any raised structures which are located in or near the neighborhood. Therefore, we believe that any development under the Dulles Rail Corridor be done in accordance with the National Historic Preservation Act, and that an A-106 analysis be conducted and impacts to the Westhampton view shed be incorporated in the mitigation plans for the Dulles Corridor Project. (0388, 0388- L- 5)

> ***Response:*** *As noted in the Final EIS, an Area of Potential Effect (APE) was identified for the project in coordination with the Virginia Department of Historic Resources. Although a portion of the Westhampton neighborhood was within the APE, this neighborhood not identified as an historic resource eligible for the National Register of Historic Places (NRHP).*
>
> *Since the Westhampton neighborhood was not identified as an eligible historic resource impacts related to the view shed were only evaluated as part of the visual conditions Analysis presented in Chapter 3*

B. Supplemental Draft EIS Comments

State Agency Comments

Need for a Programmatic Agreement

State Comment: We welcome the opportunity to discuss this project further at our next scheduled Section 106 meeting on December 16, 2003. At that meeting we will also continue our dialogue regarding the development of a Programmatic Agreement (PA) for the undertaking. We request that you continue to consult with DHR through the Section 106 process on this undertaking. (0010 0010-3)

> ***Response:*** *DRPT continued to coordinate with the Department of Historic Resources on a Section 106 Memorandum of Agreement for the Project. The executed MOA is included as Appendix F of the Final EIS.*

Issues Related to the Dulles Airport Historic District

State Comment: Similarly, the report cites "further analysis" confirming that the proposed LPA would not cause an adverse visual effect on the "peekaboo" sequence along the approach to Dulles Airport. We have not had the opportunity to review and comment on the aforementioned analysis. Therefore, we cannot agree that your assertion is correct. In fact, the issue of an appropriate National Register boundary for the airport is still an outstanding issue that must be settled before the discussion of effect can happen. (0010 0010-2)

State Comment: Regarding the potential establishment of an eastern boundary of the Dulles International Airport Historic District, any decision/actions that would lead to minimization of harm to the district should not preclude (or should take into account) any future surface transportation improvements on the DTR/DAAR (Sections 3.5 & 7) for the entire length of the Project. (0091 0106-22)

> ***Response:*** *The executed Section 106 Memorandum of Agreement, included as Appendix F of the Final EIS, describes the Project's adverse effect on the remaining historic "peekaboo" views of the main terminal control tower for approaching travelers from the Dulles International Airport Access Highway (DIAAH) and the mitigation measures. One measure is that the vertical profile of the Metrorail tracks and the concrete safety barrier will be constructed as low as practicable given site conditions to minimize any obstruction of these views of the main terminal control tower.*
>
> *Based on further consultation with MWAA and VDHR during the preparation of the Final EIS and Section 106 Memorandum Agreement, the eastern boundary of the Dulles Airport historic district has been confirmed.*

Issues Related to Hunter Mill Road

State Comment: The revised EIS asserts that there would be no adverse effect to architectural resources as a result of the LPA. We cannot concur with this statement. The project corridor crosses the boundary of the Hunter Mill Road Historic District. Despite the claim that "because the Hunter Mill Road Historic District is located within an existing transportation corridor, impacts to the district associated with this project would be minimal," you have not provided the Department of Historic Resources (DHR) sufficient information in order for us to agree with this statement. (0010 0010-1)

> ***Response:*** *DRPT continued coordination with the Virginia Department of Historic Resources during the preparation of the Final EIS and Section 106 Memorandum of Agreement. The results of this work are contained in Chapter 7 (Section 4(f) Evaluation) and Appendix F (Section 106 MOA). That coordination and the analyses in support of the Final EIS and the Section 106 process did not identify any adverse effects on the Hunter Mill Road Proposed Historic District.*

Regional Agency Comments

Issues Related to the Dulles Airport Historic District

Regional Comment: Regarding the discussion of the Dulles Airport Historic District (page 3-33), the Airports Authority maintains that the eastern boundary of the eligible historic district does not extend east of the location on the DIAAH where westbound travelers are first able to view the Main Terminal and the original Air Traffic Control Tower. (0131 0166-5)

> ***Response:*** *DRPT continued to coordinate with the Metropolitan Washington Airports Authority and the Virginia Department of Historic Resources regarding the eastern boundary of the Dulles International Airport historic district during development of the Final EIS. The Section 106 Memorandum of Agreement in Appendix F of the Final EIS describes the Project's adverse effect on the remaining historic "peekaboo" views of the main terminal control tower for approaching travelers from the Dulles International Airport Access Highway (DIAAH) and the mitigation measures. One measure is that the vertical profile of the Metrorail tracks and the concrete safety barrier will be constructed as low as practicable given site conditions to minimize any obstruction of these views of the main terminal control tower. The*
>
> *Based on further consultation with MWAA and VDHR during the preparation of the Final EIS and Section 106 Memorandum Agreement, the eastern boundary of the Dulles Airport historic district has been confirmed.*

Local Agency Comments

Definitions of the Area of Potential Effect

Local Comment: The County should continue to be a consulting party as impact mitigation strategies are discussed. Additionally, the Area of Potential Effect (APE) was defined as 200 feet beyond station footprints to allow for possible variation during construction. The County should be contacted if variations to the proposed alignment will impact additional sites. (0084 0099-2)

> ***Response:*** *Coordination efforts undertaken by DRPT during the preparation of the Final EIS have resulted in the development of both a Section 4(f) Evaluation and Section 106 Memorandum of Agreement (MOA) outlining potential effects and proposed mitigation to address impacts to cultural resources.*

Issues Related to Hunter Mill Road

Local Comment: Section 3.4.1.2 Under the last bullet on this page, the text refers to the "Hunter Mill Road Historic District". This area is not a "District"; the area is eligible for being considered for placement on the state or national registers; in other words a proposed "District". The bullet should be corrected by referring to this area as a "proposed District". References to this area are throughout the SEIS; (0093 0109-14)

Local Comment: Section 3.5 the last row of the third column indicates that the Road [Hunter Mill] has "not yet" been designated a Scenic Byway, which is not correct. The Road has been designated a Scenic Byway. (0093 0109-15)

> ***Response:*** *Thank you for your comments on the status of the Hunter Mill Road Proposed Historic District. Both of the items identified by the commenter have been clarified in the Final EIS.*

3.6 Parklands and Recreation Areas

A. Draft EIS Comments

State Agency Comments

Impacts on Existing or Planned Recreational Facilities

State Comment: Lastly, the proposed project is not anticipated to have any adverse impacts on existing or planned recreational facilities. Nor will it impact any streams on the National Park Service Nationwide Inventory, Final List of Rivers, potential Scenic Rivers, or existing or potential State Scenic Byways. Please contact DCR for an update on this information if a significant amount of time passes before it is utilized. (0407, 0407-A –29)

Response: *Comment noted.*

Regional Agency Comments

Construction Impacts to Parklands

Regional Comment: The Draft EIS states that construction would be timed for low-use periods and continued access to the park would be maintained during hours of peak use. The Draft EIS also states that construction would be in compliance with the Park Authority's Guidelines for the Development of W&OD Trail Bridge Crossings. It is Park Authority policy and the intent of the Guidelines that the trail is to remain open and safe at all times during bridge construction. Overhead protection for the trail, phased construction across the park property, trail detours, and other safety features will be required as necessary. Although not addressed in the Draft EIS, it is assumed that construction access to the Toll Road easement area will be along the Toll Road and not along the W&OD paved or gravel trails. (0456, 0456-L –2)

Response: *DRPT will continue coordination with the Northern Virginia Regional Park Authority to maintain safe access to the W&OD Railroad Regional Park during construction.*

Maintenance Responsibilities

Regional Comment: Section 7.3.2. of the *Public Hearings Report* states that any artificial lighting, which might be required by the project, would be the maintenance responsibility of the park owners. Since the artificial lighting is proposed as mitigation for the project's negative visual and safety impacts on park property, its maintenance would be the responsibility of the project sponsor.(0456 03-01)

Response: *Based on further coordination with the Northern Virginia Regional Park Authority during preparation of the Final EIS, it was determined that artificial lighting was not necessary.*

Local Agency Comments

Enhancing Accessibility to Parklands

Local Comment: FCPA comments on the NEPA EIS Scoping Process were provided on August 15, 2000. These comments stated that FCPA favors the rail alternative for the Dulles Rapid Transit Project. FCPA continues to support this alternative as the best alternative for improving regional transportation options, enhancing public accessibility to parkland and long term protection of Park resources. Further, our previous comments, a copy of which is attached, identified potential areas of impact to FCPA-owned properties. The impacts to FCPA properties are relatively similar for each alternative and have been adequately identified in the DEIS. (0306, 0306-A –1)

Response: *Comment noted. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative.*

Local Comment: FCPA reiterates its concerns that trail crossings within Stream Valley Parks adjacent to the transit alignment be included in design efforts. Further, connections from existing and planned trails to the planned stations should be designed to enhance station access. Accommodations for pedestrian and bicycle access and trail connections should be coordinated with FCPA and the County trails planner and incorporated into right of way acquisition and rail alignment planning and development. (0306, 0306-A – 3)

> ***Response:*** *The Project Team will continue coordination with the FCPA regarding the trail crossings within Stream Valley Parks that will be spanned by the LPA. The responsibility for modifications of sidewalks and trails as part of station access is with Fairfax County, Loudoun County, Town of Herndon, City of Falls Church and VDOT. DRPT will, coordinate with these jurisdictions and agencies during preliminary engineering and final design on issues related to station access .*

Incorporation of Park-related Amenities at Stations

Local Comment: Potential partnerships with FCPA to incorporate park and recreation related amenities at station locations should be explored. As mentioned in our previous comments, features such as green space, landscaping, picnic tables, cultural or natural resource interpretive areas or open space design with fountains or other elements creating a sense of place should be explored. (0306, 0306-A –4)

> ***Response:*** *Most station facilities would include landscape elements. Other amenities cited in this comment could be provided by others, and would be subject to coordination with project site access, functional requirements, risk management, real estate constraints and regulations of local government. Further coordination will occur as the project moves through preliminary engineering and final design.*

B. Supplemental DEIS Comments

State Agency Comments

Issues Related to the W&OD Trail

State Comment: the SDEIS does a thorough job of addressing the impacts of crossings of the Washington and Old Dominion (W&OD) Trail. It should be noted that a planned future greenway/trail in the area is not addressed in the SDEIS. That trail, the Fairfax Cross-Country Trail, is to connect Great Falls National Park with Fort Belvoir. The transit corridor will cross this trail corridor; accordingly, the proponents should consider, and provide accommodation for, this trail in final plans. (0080 0094-8)

> ***Response:*** *The Fairfax Cross-Country Trail is identified in Section 3.6 of the Final EIS.*

Issues Related to Other Trails and Recreational Areas

State Comment: Although there is "no change" in effects from the DEIS, this table [Table 3.6-1] indicates that there may be possible impacts to future trails from Tysons East Station, Tysons Central 7 Station, Tysons 7 Station, Tysons Central 123 Station, and Wiehle Avenue Station. Please indicate actions the Project will take to address these possible impacts. It is important to provide non motorized facilities for transit riders to access these stations, particularly in Tysons Corner. (0091 0106-6)

State Comment: "Increased vehicle traffic at Wiehle Avenue Station may impact future trails proposed in Fairfax County's Countywide Trails Plan (June 2002)." Please indicate actions the Project will take to address these possible impacts. (0091 0106-7)

Response: *Should any of the future trails included in the Fairfax County* Countywide Trails Plan *be constructed prior to construction of the Wiehle Avenue Extension (formerly LPA Phase 1), mitigation measures would be similar to those discussed in Section 3.6 of the Final EIS for existing park and recreation facilities.*

Regional Agency Comments

Issues Related to the W&OD Trail

Regional Comment: The Supplemental Draft EIS states that at the W&OD Railroad Regional Park, access to the park would be maintained during hours of peak use. As stated in previous comments on the Draft EIS, it is Park Authority policy and the intent of the Guidelines for the Development of W&OD Trail Bridge Crossings that the trail is to remain open and safe at all times during bridge construction. Overhead protection for the trail, phased construction across the park property, trail detours, and other safety features will be required as necessary. (0086 0101-1)

Response: *All bridge design and construction would be completed in accordance with the Northern Virginia Regional Park Authority's Guideline for the Development of W&OD Trail Bridge Crossings. Details relating to park access during construction activities would be coordinated with the Northern Virginia Regional Park Authority.*

Regional Comment: Also, please confirm that construction access to the Toll Road easement area will be along the Toll Road and not along the W&OD paved or gravel trails. (0086 0101-2)

Response: *Access for the construction of the Metrorail Extension in the median of the DIAAH will be via the DIAAH and would not be along the W&OD Railroad Regional Park's paved or gravel trails.*

Local Agency Comments

Issues Related to Other Trails and Recreational Areas

Local Comment: The document states that temporary construction impacts at the Moorefield Station recreation center and athletic fields will be mitigated, but does not provide any information as to how impacts will be mitigated. (0084 0099-3)

Response: *Although temporary increases in noise, vibration, and air-borne particles could occur in the vicinity of the proposed recreation center and athletic fields at Moorefield Station during the construction of the Route 772 Station, construction activities would occur at least one-half mile from these sites. Therefore, no potential impacts to facility use or access during construction have been identified and mitigation measures are not recommended.*

3.7 Safety and Security

A Draft EIS Comments

Federal Agency Comments

Concern About Airport Security

Federal Comment: Concerned about security at Dulles Airport. Concerned that the project, particularly the Service and Inspection (S&I) Yard (Site 15) would be a substantial intrusion into airport property. Would not be comfortable with anything unless the Transportation Security Agency (TSA) "signs off" on the project. (0485 03-02)

Response: *During preliminary engineering, DRPT will coordinate with TSA, MWAA, and the Federal Aviation Administration (FAA) regarding airport security issues.*

State Agency Comments

Protection Against Potential Hazards

State Comment: SWM ponds may require access for maintenance - show how this is to occur. Also these are regarded as hazards to be protected by guardrail - If joint pond, the pond will need to meet state or county design standards as appropriate. (0421, 0421-A –30)

Response: *The pond locations are preliminary. Access for maintenance and protection of roadways adjacent to proposed ponds would be designed in accordance with applicable federal, VDOT, or local jurisdiction design criteria. This will be further defined during preliminary engineering and final design.*

State Comment: Review guard rail / barrier requirements beyond normal roadway warrants if a vehicle striking obstruction would result in hazard or result in collateral hazard to road or rail if hit. IE would damage to facility cause further injury or loss of life (power stations/control facilities). (0421, 0421-A –31)

Response: *Preliminary engineering and final design will comply with current federal or VDOT standards for roadside barrier design.*

State Comment: Limited access facilities have special requirements that must be met even for the infrequent access to maintain ponds/power stations. If access can be reasonably or economically provided from other than the limited access facility this is recommended. (0421, 0421-A –32)

Response: *No access points are currently planned for ponds or ancillary facilities directly from the limited access freeways (Dulles Connector Road, Dulles Toll Road or Dulles Greenway). Access points currently shown along interchange ramps would be evaluated during preliminary engineering to determine if they can be safely implemented without impacting operations of the freeway.*

Safety of Structural Design

State Comment: All structures including columns should be of adequate design, location and depth so that planned / future interchanges shall not have to replace, reinforce or underpin these structures. (0421, 0421-A –33)

Response: *The Project Team has developed and coordinated the preliminary structural designs with planned/future interchange locations to ensure that there is no reconstruction of rail structures during implementation of identified, planned roadway improvements. This coordination would continue through preliminary engineering and final design.*

State Comment: In general, structures/ column placement at intersections should be placed to meet sight distance requirements for streets, side road and entrances. (0421, 0421-A –34)

Response: *Design of columns and structures will comply with federal and VDOT standards for sight distance criteria, which will be examined in more detail during preliminary engineering.*

Regional Agency Comments

Public Safety and Security Concerns

Regional Comment: As stated in the Draft EIS, the planned widening of the Dulles Toll Road overpasses and the new bridge for Metrorail would nearly eliminate the existing light well between the

existing overpasses resulting in "a visual impact to the trail." The Draft EIS states that the visual impact can be mitigated with the incorporation of natural and artificial lighting under the bridge. It should also be noted that elimination of the light well might result in safety and security impacts such as reduced visibility and crime. The Final EIS should address safety and security issues related to elimination of the light well and related mitigation, such as lighting and call boxes. Moreover, the Park Authority must be involved in the development of mitigation measures during all design phases. (0456, 0456-L –1)

Response: *DRPT will continue coordination with the Northern Virginia Regional Park Authority regarding appropriate mitigation measures for effects to the W&OD Railroad Regional Park. The current design for the Metrorail bridge shown in the final General Plans (Volume IV of the Final EIS is a three-span overpass. Based on further coordination with the Northern Virginia Regional Park Authority during preparation of the Final EIS, it was determined that requested artificial lighting was no longer necessary.*

Local Agency Comments

Public Safety and Security Concerns

Local Comment: The draft EIS has failed to adequately address public safety and infrastructure issues regarding pedestrian traffic (especially students) conflicting with vehicular traffic in and around the West Falls Church Metro Station, given the prediction for increased vehicle trips per day. (0122, 0122-A –4)

Local Comment: We suspect there may be tremendous safety concerns if proper evaluations are not conducted. We believe our neighborhood streets will be inundated with motor vehicles and that the project will be considered a failure by our citizens. Existing infrastructures will be adversely affected and must be effectively remedied by operational plans and new facilities. (0122, 0164-T –10)

Response: *Based on the analysis of the forecast traffic volumes for the East and West Falls Church Metrorail Stations, the Project Team does not feel that overflow parking onto residential streets will be a problem. Moreover, since completion of the Draft EIS analysis, WMATA has programmed a 960-space parking facility at West Falls Church to be completed in early 2005. The Project Team also initiated meetings with the City of Falls Church to discuss the issues of overflow parking and cut-through traffic.*

Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level. Nevertheless, the Project Team does not anticipate any increases in project-related cut-through traffic in the Westhampton neighborhood.

Local Comment: Provide safety and security to the community and the rail system by delineating law enforcement roles and through early implementation of rail to provide needed transportation capacity in the corridor for emergency or disaster events. (0437, 0437-E –11)

Response: *WMATA operates a police force that has jurisdiction in the stations, trains, buses, and parking lots of the Metrorail, Metrobus and MetroAccess systems. Outside the WMATA system, law enforcement is handled by local jurisdictions or agencies. In some cases, WMATA operates with local and state police agencies under mutual aid agreements. A similar mutual aid agreement would need to be finalized before the start of operations of the Metrorail Extension.*

Public Comments

Protection Against Potential Hazards

Public Comment: Underground emphasis enhances anti-terrorism defense and facility security. This should enable additional federal funding to be provided. (0047, 0047-CC-2)

> ***Response:*** *Comment noted. Security was a major concern for both the airport and the Project Team throughout the project. Safety and security issues are discussed in further detail in Section 3.7 of the Final EIS.*

Public Safety and Security Concerns

Public Comment: Safety is a serious concern! Boys from "the hood" will try to scale the high iron perimeter fence just replaced in 2001, at considerable expense. (0058, 0058-CC-2)

Public Comment: Bus safety is inferior to rail safety. Official Federal Transit Administration records show that rail service averages less than one injury or very rare fatality per million passenger-miles. Urban bus service averages closer to two such, at least seventy (70) percent more dangerous. (0013, 0013-L –11)

> ***Response:*** *The Project Team agrees that safety is a serious concern and, as standard practice, WMATA employs many measures to ensure patron safety at each of the stations and on the trains. Section 3.7 of the Final EIS addresses safety and security issues related to existing and proposed Metrorail stations, park-and-ride facilities, and vehicles.*

Public Comment: One extremely negative aspect of Bus Rapid Transit for Dulles is the double crossover at stations. Diagrams show buses at center island stations below a mezzanine. Buses have doors on the right hand (curb) side, so to use island platforms they have to operate a British style on the left lane. This means they must cross in front of each other in opposite directions both entering and leaving stations. This is extremely dangerous when there will be a bus every 72 seconds in each direction. On most days there will be no problem, but with over a million such conflicts a year, it is too much to assume perfection. A safety rate of 99.999 per cent would still result in one head-to-head collision per month. A safety signal system would slow travel, but should be required by the National Transportation Safety Board. (0013, 0013-L –18)

Public Comment: As I said in the hearing, the double cross-overs create unnecessary vehicle conflicts. But one can simply get around that by putting outside platforms at the stations. If you're not worried about a passing lane for the buses, this can be shoe-horned into 52 feet, with elevators, with ADA access. If you want a passing lane in the center, which would be a good idea of you're looking for a permanent Bus Rapid Transit system, then you could put that into 66 feet. This might require, in some locations, a minor adjustment to a half-lane adjustment to the Dulles Toll Road alignments, which would run up the cost somewhat. But if this is a permanent solution, it would be well worth it. (0255, 0420-T –1)

Public Comment: One of the first things I noticed in looking at the [BRT] plans is the actually crossing the buses over each other at each station to get to a metrorail type transit station twice. This kind of vehicle conflict is just asking for trouble. (0255, 0255-T –2)

> ***Response*****:** *BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Public Comment: Big parking lots and empty walkways over highways at night are creepy and dangerous. The West Falls Church Metro is a good example. Please keep safety and accessibility at the top of your priorities in planning the new stations and surrounding developments. Let's give teenagers, women, men, children, all of us, the chance to use the Metro line at all times. Our community will truly benefit. (0232, 0232-L –4)

Public Comment: My major point for the public record is that we need to make the Metro stations and ways to access them safer and less creepy, especially at night, or citizens will choose their cars. I would

like a study to be done on a few stations to understand how people use the station - what time of day, do they walk there, bicycle, drive, avoid it at certain times? I lived in Arlington on N. 17th St., a 15 minute walk to the Ballston Station, for three years. I tried to take the Metro a few times in the evening, but there was no one around when I walked. I've had a big knife pulled on me once in a similar situation. Isolation and a woman walking at night in a non-pedestrian friendly station and surroundings is a dangerous combination. I chose my car. (0232, 0232-L –2)

> ***Response***: *WMATA operates a police force that has jurisdiction in the stations, trains, buses, and parking facilities of the Metrorail, Metrobus and MetroAccess systems and will continue to work hard to ensure patron safety. Section 3.7 of the Final EIS addresses safety and security issues related to existing and proposed Metrorail stations, park-and-ride facilities and vehicles.*

Public Comment: Include in the project's draft environmental impact statement an analysis of and mitigation strategies for human health and environment impacts of pollution and cut-through traffic on the public safety and compliance with federal Clean Air and Water Acts of surrounding communities [Westhampton]. (0386, 0386-E –10) (0398, 0398-L –10) (0399, 0399-L –10) (0403, 0403-L –9) (0412, 0412-L –10) (0415, 0415-L –10)(0416, 0416-L –10) (0430, 0430-E –10) (0431, 0431-E –10)(0438, 0438-E –9)(0442, 0442-L –9)(0465, 0465-L –10)(0466, 0466-L –9)(0467, 0467-L –9) (0469, 0469-L –9) (0470, 0470-L –10) (0471, 0471-L –9) (0473, 0473-L –10) (0474, 0474-L –10)

Public Comment: Requests that the Project Team include an analysis of human health and environmental impacts of pollution and cut-through traffic on surrounding communities in terms of public safety and compliance with the federal Clean Air and Water Acts in the Final EIS. Also requesting appropriate mitigation strategies to address impacts. (0117 03-02)

Public Comment: Public safety hazards and pollution from increased cut-through traffic. The new facility will result in increased Metro ridership. This will in turn result in many more cabs and cars dropping off passengers at the West Falls Church Kiss and Ride and an increased volume of traffic cutting through our neighborhood to avoid the light at Haycock and Great Falls Streets. The cut-through traffic will create a public safety hazard to pedestrians and increased pollutants from cars in the form of exhaust; fugitive dust; and routine gasoline and oil leaks affecting the health of residents and contaminating Pimmit Run, a tributary of the Potomac River that passes through our neighborhood. (0386, 0386-E –5) (0398, 0398-L –5) (0399, 0399-L –5) (0403, 0403-L –4) (0412, 0412-L –5) (0415, 0415-L –5) (0416, 0416-L –5) (0422, 0422-E –3) (0430, 0430-E –5) (0431, 0431-E –5) (0465, 0465-L –5) (0470, 0470-L –5)(0473, 0473-L –5) (0474, 0474-L –5)

> ***Response:*** *Based on the analysis of the forecast traffic volumes for the East and West Falls Church Metrorail Stations, the Project Team does not feel that overflow parking onto residential streets will be a problem. Moreover, since completion of the Draft EIS analysis, WMATA has programmed a 960-space parking facility at West Falls Church to be completed in early 2005. The Project Team also initiated meetings with the City of Falls Church to discuss the issues of overflow parking and cut-through traffic.*
>
> *Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level. Nevertheless, the Project Team does not anticipate any increases in project-related cut-through traffic in the Westhampton neighborhood.*
>
> *While some of the proposed improvements near the West Falls Church Yard and in the median of the Dulles Connector Road would be located near an unnamed tributary to Pimmit Run, there would be virtually no impacts to the floodplain elevation, water quality, hydrology, or the CBPA and EQC designations of this resource. As discussed in Chapter 4 of the Final EIS, best management practices would be employed during the construction and operation of the transit improvements. With the use of these best management practices for stormwater management*

and erosion and sediment control during the construction and operation of the LPA, degradation of surface water and groundwater quality would be minimal and would be limited to the immediate vicinity of the proposed improvements. Therefore, resources such as the Potomac River would not be affected.

Public Comment: In addition, the traffic congestion on Haycock Rd. has already produced cut-through traffic in the Westhampton Neighborhood, as cars attempt to avoid the light at Haycock Road and Great Falls St. This is a danger to residents of the Westhampton neighborhood. We believe that the mitigation strategies in the plans for the Dulles Corridor Project should include measures such as speed bumps on Grayson Place and signs forbidding cut-through traffic in the Westhampton neighborhood. This should be coupled with increased traffic enforcement by Fairfax County. Such measures would help reduce mobile source air pollution impacts on the health of residents in the neighborhood and improve compliance with the provisions of the federal Clean Air Act. (0388, 0388- L-3)

Public Comment: There is a current problem with motorists who cut through our Westhampton neighborhood to avoid stoplights at the intersection of Haycock Road and Great Falls Street. Instead, they detour via Reynolds Street, to Grayson Place, to Romney Street, to Hutchison, to Great Falls. Narrow streets; fast driving; no sidewalks, curbs, or gutters; abrupt turns with several visual barriers; and occasional one-way "choke points" because [of] shoulder parking create safety hazards that can only grow worse. Residents have asked for help to "calm" the traffic, but according to Fairfax County guidelines, the neighborhood does not currently meet traffic volume criteria. With completion of the Dulles Corridor Rapid Transit Project…including construction of a new, 2,000-car park-and-ride facility…the cut-through problem will become more acute. It seems reasonable that traffic control features should be put into place along with construction of the Dulles Project/park-and-ride in anticipation of future traffic volumes. Therefore, it seems to me that there is a need for WMATA, VDT, and Fairfax County to coordinate planning and installation measures to deal with this potentially dangerous situation in a timely manner. (0432, 0432-E –14)

Response: *Based on the analysis of the forecast traffic volumes for the East and West Falls Church Metrorail Stations, the Project Team does not feel that overflow parking onto residential streets will be a problem. Moreover, since completion of the Draft EIS analysis, WMATA has programmed a 960-space parking facility at West Falls Church to be completed in early 2005. The Project Team also initiated meetings with the City of Falls Church to discuss the issues of overflow parking and cut-through traffic.*

Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level. Nevertheless, the Project Team does not anticipate any increases in project-related cut-through traffic in the Westhampton neighborhood.

It is not the responsibility of the Dulles Corridor Rapid Transit Project to mitigate existing roadway/traffic issues, such as cut-through traffic on Grayson Place. Since the project would not be increasing vehicle traffic within the station area, but would actually be ameliorating the number of vehicle trips, speed bumps an/or additional signage would not be required as mitigation measures as part of this Project.

Based on the analysis provided in Chapter 6 of the Final EIS, mitigation would not be warranted at the Haycock Road/Great Falls Street intersection for the LPA. . For the traffic analysis, the Project Team used the Synchro software package, which optimizes consecutive traffic signals as a unit so that they all run on the same cycle. The traffic signals that were optimized/synchronized for the traffic analysis include the Great Falls Street/Haycock Road, Haycock Road/West Falls Church Metrorail Station entrance, and Haycock Road/Route 7 intersections.

Public Comment: Need to analyze project impacts of cut-through traffic and related safety and air quality effects. Was not done in the Draft EIS. (0430 03-03)

> ***Response:*** *The Project Team does not anticipate any increases in project-related cut-through traffic in the Westhampton community. Additionally, since the project would not be increasing cut-through traffic, the Project would not have additional negative effects on air quality.*

Public Comment: Concerned that the pond will create a drowning and fall hazard for children and that the pond could serve as a breeding ground for mosquitoes, which could increase the threat of West Nile Virus. (0383 03-03)

> ***Response:*** *None of the proposed dry ponds would have a permanent water surface elevation, and all will have security fencing discouraging unauthorized access.*

Emergency Evacuation Using Rail

Public Comment: Use of Metrorail during 9/11 evacuation demonstrated utility of heavy rail to move large # of people in an emergency. (0047, 0047-CC-4)

> ***Response:*** *The LPA would provide the ability to move large numbers of people during emergencies that do not affect the transit system (e.g., loss of power).*

Need to Integrate the Project within the Context of the National Transportation Emergency System

Public Comment: The only rational way to discuss the transportation problems of the Dulles Rail Corridor is within the context of the National Transportation Emergency which currently exists. The ongoing breakdown of the rail and airline systems of the United States currently represents a grave threat to the national security of our country, as well as to the integrity of our nation and national economy. We don't need patchwork; we need a federally funded, national emergency program. (0482, 0482-E –1)

> ***Response:*** *The Final EIS considered rapid transit improvements within the Dulles Corridor. The development of a federally funded national emergency program is beyond the scope of the study and would not be within the control of the Project Team.*

B. Supplemental Draft EIS Comments

Public Comments

Safety Hazards Related to Construction

Public Comment: The noise is so severe in our neighborhood that one cannot walk along our streets safely due to the inability to hear an approaching automobile from behind. This is a public safety hazard that will only be made worse by the construction of Metrorail without the construction of sound walls along the Dulles Toll Road. (0116 0141-5)

> ***Response:*** *Comment noted. A discussion of noise impacts and proposed mitigation along the corridor is contained in Section 4.7 of the Final EIS.*

Safety Hazards Related to Stormwater Retention

Public Comment: The pond that is to be constructed on my property is said to be a dry pond. I have consulted a licensed PE who was formerly employed by Fairfax County that actually maintain these ponds. He informed me there would always be some moisture in these ponds which provides for an excellent breeding ground for mosquitoes, which raises the threat of West Nile virus, especially for the senior citizens and immuno compromise who live within the bounds of our neighborhood. (0116 0141-7)

Response: *The locations shown in the General Plans of Best Management Practice (BMP) and Stormwater Management (SWM) ponds throughout the corridor are approximate and were included to illustrate that a potential need for one of these facilities exists. During preliminary engineering, a comprehensive drainage study will be undertaken for the entire corridor to address final locations of all BMP and SWM ponds. This effort should result in some facilities being eliminated, consolidated, or relocated to further minimize impacts to the adjacent areas.*

Final design of stormwater management facilities would meet all jurisdictional standards and approval requirements of Fairfax County. According to the Fairfax County Department of Public Works and Environmental Services, "dry" stormwater retention ponds, as designed, are meant to hold water for brief periods of time. Typically, a "dry" facility is designed to hold water for a maximum of 48 to 72 hours. However, proper maintenance would be required to ensure that these facilities operate as designed. Mosquito larvae require 7 to 10 days in standing water to produce mosquitoes. Properly maintained "dry" retention ponds should not provide adequate conditions for mosquito larvae to survive long enough to produce mosquitoes. For more information, please refer to the Fairfax County government website and practices relating to mosquito control.

3.8 Environmental Justice

A. Draft EIS Comments

No comments pertaining to this topic were received.

B. Supplemental Draft EIS Comments

Public Comments

Outreach Efforts to Minority Groups

Public Comment: A question was asked that you identify the public outreach programs to minority groups. Your responded by referring me to the DEIS. On p II-8 of the DEIS, there is a lack of evidence noting the public outreach to minority groups. Therefore, my environmental justice question has not been appropriately answered.(0109 03-01)

Response: *Chapter 11 of the Final EIS provides additional detail regarding the comprehensive public involvement effort employed by the Project Team, including media outlets, project information, and press statements prepared in both Spanish and English.*

Issues Related to Potential Discrimination

Public Comment: Discriminates against the Less Affluent: The proposal is to spend as much to enhance an existing rapid transit service to the wealthiest single community in Virginia as the Governor's Six-Year Plan proposes to spend on all transportation projects in Northern Virginia from now through 2009. Meanwhile, the State provides over that same period no transit service enhancements at all to the un-served and under-served less affluent communities in N. VA and the rest of the state. (0072 0150-7)

Response: *The Dulles Corridor Rapid Transit Project is an important part of the region's approved constrained long-range transportation plan. The project was designed to link the region's busiest activity centers and bring Metrorail to Washington Dulles International Airport.*

The Project will also offer an opportunity for reverse commuting from the District of Columbia and other jurisdictions to the Corridor. Job-seekers from across the region will be able be reach employment opportunities in one of the nation's fastest-growing business centers.

Public Comment: What are the environmental justice issues that will be present when Reston East to West Falls Church is eliminated? (0107 0125-14)

> ***Response:*** *The existing bus service between the Reston East Park-and-Ride and West Falls Church would be replaced by Metrorail service upon the start of operations of the Wiehle Avenue Extension. The impacts of the Project on communities considered for environmental justice impacts under Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, are discussed in Section 3.8 of the Final EIS.*

Public Comment: What is the minority bus ridership on the present Reston East to West Falls Church? (0107 0125-13)

Public Comment: What percentage of ridership from Reston East bus riders is drawn from minority groups? Please do not state that this analysis was not done. This analysis is an environmental justice issue that is required by the NEPA process. If this analysis was not done, then please explain why not and what steps you will take to rectify. (0109 0128-14)

Public Comment: The SDEIS must contain meaningful data concerning the disproportionate impacts to Minority/Low income populations (e.g., TABLE 2-2).

This aspect demonstrates the critical importance of conducting a meaningful, objective Alternatives Analysis, since the issue is not whether phasing a Metrorail project will disproportionately affect minority/low income populations, but whether rail vs. some other mode of mass transit would have a less disproportionate impact on those populations. (0068 0173-28)

> ***Response:*** *Data on minority bus ridership between Wiehle Avenue and West Falls Church Station is not collected because it does not support any of the route and service planning done by Fairfax County.*
>
> *Section 3.8 of the Final EIS explains the methodology used to conduct the environmental justice analysis for the project. This analysis was completed in accordance with Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, as well as relevant guidance from the Council on Environmental Quality, U.S. DOT, and U.S. EPA.*

Public Outreach to Minority Groups

Public Comment: What public outreach programs were implemented to reach minority groups? Be very specific and identify. The listing in the back of the DEIS and SDEIS fails to clearly identify this type of outreach. How was the environmental justice requirement met? How many DEIS and SDEIS were distributed to minority groups? How many community meetings were held with minority groups? (0109 0128-24)

> ***Response:*** *Section 3.8 of the Final EIS describes the methodology used to meet federal requirements on environmental justice, per Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations. Since the start of the Project's environmental review, extensive public outreach to all communities has been conducted through the use of various types of media, public displays, community meetings, and public hearings. The largest minority community identified throughout the Dulles Corridor is Spanish-speaking. Therefore, all newsletters and updates have a section in Spanish that informs Spanish-speaking individuals how to obtain more detailed project information in Spanish. In addition to Spanish-speaking communities, other minority groups were informed through various communications outlets directed toward minority populations. All communities and minority groups were encouraged to participate in the public outreach process. Chapter 11 of the Final EIS outlines the public outreach efforts throughout the course of the project. A list of document recipients can be found in Appendix B of the Final EIS.*

4.0 ENVIRONMENTAL EFFECTS

4.1 Geologic Resources

A. Draft EIS Comments

Impacts to Soils and Prime Farmland

Federal Agency Comments

Federal Comment: NRCS has reviewed this document to ensure that impacts to soils and prime farmland were adequately documented. Section 4.1.3.3 - Soils and Section 4.1.3.4 - Prime Farmland provide this documentation. Virginia NRCS has no objection to this proposal. (0001, 0001-A –1)

Response: *Thank you for your input.*

State Agency Comments

Submittal of Erosion and Sediment Control Specifications to the Virginia Department of Conservation and Recreation

State Comment: On behalf of the Virginia Soil & Water Conservation Board, the Virginia Department of Conservation and Recreation (DCR) requests Erosion & Sediment Control (ESC) Specifications for 2003 for your company per Section 10.1-563 of the Virginia Erosion & Sediment Control Law. The deadline for submitting these specifications is September 15, 2002. (0002, 0002-A –1)

State Comment: Additionally, please provide updated company contact person information along with your ESC Specifications, and route this letter to the appropriate engineer or regulatory person within your company. (0002, 0002-A –2)

Response: *A Locally Preferred Alternative (LPA) has been selected that is detailed in the Final EIS. More specific erosion and sediment control specifications will be developed during preliminary engineering and the appropriate Project staff person will contact the DCR for further coordination required.*

Comments on Natural Resources Technical Report

State Comment: Natural Resources Technical Report (June 2002). The 95% Draft EIS Technical Report was reviewed and deemed to adequately address Natural Resources issues. Since the Final Draft Technical Report appears to be essentially unchanged, we have no further comments on this section of the report. (0421, 0421-A –10)

Response: *Thank you for your input.*

Virginia Department of Mines, Minerals, and Energy Determination of No Impact

State Comment: States that the Virginia Department of Mines, Minerals, and Energy determined that the project would have no impact on the geology or mineral resources of the corridor. (0517, 4-01)

Response: *The Natural Resources Conservation Service and the Virginia Soil and Water Conservation Board made similar comments.*

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received.

4.2 Water Resources

A. Draft EIS Comments

State Agency Comments

DEQ's Water Division's Comments on Mitigating Impacts on Water Resources

State Comment: According to DEQ's Division of Water Program Coordination, Office of Water Permits Support (hereinafter "DEQ's Water Division"), any of the "build alternatives" would affect surface waters and wetlands. The limitation of proposed construction to the median of existing roads, as much as practicable, will be helpful in avoiding and minimizing wetland and waterway impacts of the project; we encourage additional efforts in this regard as the project progresses. Examples of avoidance and minimization efforts include completely spanning wetlands to avoid impacts, and shifting the alignment of road or rail structures. Unavoidable impacts to wetlands and streams may require compensatory mitigation, as the Draft EIS explains (pages 4-54 through 4-58, section 4.2.6). (0407, 0407-A-8)

> ***Response:*** *Through an iterative design process, impacts to wetlands, streams, and floodplains were avoided to the extent practicable. In many cases, these efforts avoided direct impacts to these resources completely. As described in Section 4.2 of the Final EIS, compensatory mitigation will be implemented where unavoidable effects remain.*

Consistency with the Chesapeake Bay Preservation Area Designation and Management Regulations

State Comment: Chesapeake Bay Preservation Act Compliance. Road and railway projects are conditionally exempt from the requirements of the Chesapeake Bay Preservation Area Designation and Management Regulations (9 VAC 10-20-10 et seq.) provided such projects are constructed, operated, and maintained in accordance with the Virginia Erosion and Sediment Control Law and the Virginia Stormwater Management Act (or an equivalent local program). This conditional exemption also requires that road alignments and design prevent or otherwise minimize (i) encroachment in Resource Protection Areas, as defined in the Regulations, and (ii) adverse effects on water quality. Non-linear features of the project, such as parking lots and stations, are not exempt and must be consistent with the General Performance Criteria and the Development Criteria for Resource Protection Areas. (Both the General Performance Criteria and the Development Criteria are found in the Regulations.) During planning and design phases, site-specific surveys should be concluded to verify the presence or absence, and boundaries, of any Resource Protection Areas. (0407, 0407-A –10)

> ***Response:*** *The boundaries of Resource Protection Areas (RPA) have been identified in the Final EIS. A discussion of Chesapeake Bay Preservation Areas including Resource Management Areas (RMA) and RPA can be found in Section 4.2 of the Final EIS and are illustrated in Figure 4.2-4. Impacts to RPAs from the Build Alternatives studied were minimized through an iterative design process.*

Department of Conservation and Recreation of No Impact on Certain Water Resources

State Comment: The Department of Conservation and Recreation has indicated that the proposed project will not affect any streams on the National Park Service Nationwide Inventory, Final List of Rivers, or existing or potential State Scenic Rivers. Nor will the project affect existing or potential State Scenic Byways. (0407, 0407-A –11)

> ***Response:*** *This information is included in Section 4.2 of the Final EIS.*

Recommendation to Develop an Environmental Management System

State Comment: Consider development of an effective Environmental Management System (EMS). An effective EMS will ensure that the proposed facility is committed to minimizing its environmental impacts, setting environmental goals, and achieving improvements in its environmental performance. DEQ offers EMS development assistance and recognizes facilities with effective Environmental Management Systems through its Virginia Environmental Excellence Program. (0407, 0407-A –13)

> ***Response:*** *The Virginia DEQ Internet site states: "In April, 2000, DEQ launched the Virginia Environmental Excellence Program, a voluntary program designed to encourage Virginia organizations to develop environmental management systems and pollution prevention plans. As part of its efforts to promote the use of environmental management systems (EMS), DEQ announced in June 2001 that it had developed an EMS of its own." At this time, the Project Team has not made any decision regarding the Virginia Environmental Excellence Program for the Dulles Corridor Rapid Transit Project, but has already minimized impacts to natural resources through an iterative design process.*

Comments on Virginia Pollutant Discharge Elimination System Stormwater General Permits

State Comment: Water Quality and Wetland Permitting. The Draft EIS addresses the need for obtaining Virginia Pollutant Discharge Elimination System (VPDES) Stormwater General Permits for construction activity that disturbs 5 or more acres of land (page 4-19, section 4.2.1). The project manager should be aware that the regulation on this subject is changing; sites that are between 1 and 5 acres will also be required to apply for coverage under this General Permit by March 10, 2003. (0407, 0407-A –21)

State Comment: Stormwater management facilities are proposed along the route to handle storm flow from the system (Draft EIS, section 2, Figure 2.3-16). The project manager should work with DEQ to ensure that necessary VPDES permits are obtained for these facilities. If de-watering of the tunnels for the underground Metrorail stations is necessary, a VPDES permit might be necessary for discharges resulting from this activity. (0407, 0407-A –22)

State Comment: Site-specific VPDES permits and/or VPDES Stormwater General Permits may also be needed for BRT stations and the Maintenance and Storage Facility contemplated under the BRT alternative. Similarly, if the Metrorail alternative is selected, permits may be required for discharges from the Service and Inspection Yard. The Yard is to include a car wash and stormwater management facilities of its own. If flow from the car wash is discharged to the sanitary sewer, then an industrial user permit is likely to be required for the wastewater treatment plant accepting the flow. (0407, 0407-A –23)

State Comment: The Draft EIS indicates that both VPDES and Virginia Water Protection Permits (VWPP) will be required for construction of the underground sections of the Metrorail, according to DEQ's Northern Virginia Regional Office. However, VWP permits will only be required if wetlands will be involved. (0407, 0407-A –24)

State Comment: This project may require a Virginia Water Protection Permit, which includes coordination of this project with the Virginia Marine Resources Commission, the Army Corps of Engineers and the DEQ through the Joint Permit Application process. (0407, 0407-A –35)

> ***Response:*** *All permits that are required for implementation and construction of the LPA, a Metrorail Extension, will be identified through coordination with resource agencies and permits will be obtained prior to construction. The information contained in the above comments is reflected in Section 4.2 of the Final EIS, as appropriate. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. The LPA is described in more detail in Chapter 2.*

Avoiding and Mitigating Effects on State Waters

State Comment: The DEIS indicates all Build Alternatives will impact state waters, including wetlands. All attempts should be made to select the most feasible alternative that also avoids and minimizes potential direct and indirect impacts to wetlands and streams to the greatest extent practicable. We understand that impacts have been avoided and minimized by limiting proposed construction to the median of existing roadways as much as practicable. As the project progresses, please continue to investigate ways for additional avoidance and minimization of direct and indirect impacts to wetlands and streams to the greatest extent practicable. Examples of avoidance and minimization efforts include completely spanning wetlands to avoid impact and shifting the alignment to avoid or minimize wetland impacts. The selected alternative's unavoidable impacts to wetlands and streams will require full compensatory migration as explained in the DEIS. (0407, 0407-A –34)

> ***Response:*** *The Metrorail Extension was selected as the LPA after public and agency review of and comment on the Draft EIS. Impacts to water resources such as wetlands are described in Section 4.2 of the Final EIS. Preliminary efforts have been made to minimize direct and indirect impacts to wetlands. During preliminary engineering and final design, the Project Team will continue to investigate methods for additional avoidance and minimization of direct and indirect impacts to wetlands and streams, as suggested. Where impacts are unavoidable, compensatory mitigation measures will be developed in coordination with resource agencies.*

Avoiding and Minimizing Effects on State Waters During Construction

State Comment: Appropriate design and construction measures should be employed to avoid and minimize impacts to state waters during construction. All applicable best management practices should be used to minimize potential impacts. Machinery should be kept out of waterway and wetlands when possible. Machinery that must be operated within wetland areas should be maintained on mats in order to prevent tire rutting. In general, DEQ encourages the use of erosion and sediment control measures, adherence to storm water management regulations, and careful construction practices to minimize temporary impacts to state waters during site construction activities. (0407, 0407-A –36)

State Comment: In general, DEQ recommends that stream and wetland impacts be avoided to the maximum extent practicable. For unavoidable impacts, DEQ encourages the following practices to minimize the impacts to wetlands and waterways: operate machinery and construction vehicles outside of stream-beds and wetlands; use synthetic mats when in-stream work is unavoidable; erosion and sedimentation controls should be designed in accordance with the most current edition of the Virginia Erosion and Sediment Control Handbook. These controls should be in place prior to clearing and grading, and maintained in good working order to minimize impacts to State waters. The controls should remain in place until the area is stabilized. (See item 6, below.) Place heavy equipment, located in temporarily impacted wetland areas, on mats, geotextile fabric, or use other suitable measures to minimize soil disturbance, to the maximum extent practicable. Restore all temporarily disturbed wetland areas to pre-construction conditions and plant or seed with appropriate wetlands vegetation in accordance with the cover type (emergent, scrub-shrub, or forested). The project managers should take all appropriate measures to promote re-vegetation of these areas. Stabilization and restoration efforts should occur immediately after the temporary disturbance of each wetland area instead of waiting until the entire project has been completed. Place all materials which are temporarily stockpiled in wetlands, designated for use for the immediate stabilization of wetlands, on mats or geotextile fabric in order to prevent entry into State waters. These materials should be managed in a manner that prevents leachates from entering state waters and must be entirely removed within thirty days following completion of that construction activity. The disturbed areas should be returned to their original contours, stabilized within thirty days following removal of the stockpile, and restored to the original vegetated state. The project may require a Virginia Water Protection Permit, and it is likely to require a Virginia Pollutant Discharge Elimination System (VPDES) Stormwater permit. (0407, 0407-A –9)

Response: *As discussed in Section 4.2 of the Final EIS, the Project Team will follow the Public Facilities Manual, Virginia Erosion and Sediment Control Handbook, and all other applicable requirements.*

Coordination with Federal, State, and Local Governments to Minimize Effects

State Comment: In general, the document states in numerous sections that all necessary environmental permits will be obtained, which satisfies the thrust of NRO concerns. However, close coordination with the various federal, state, and local governments will be key to ensuring that a project of this magnitude is completed with minimal environmental damage. (0407, 0407-A –39)

Response: *Coordination with key agencies will be conducted throughout the life of the Project.*

Commending the Project Team for Addressing Agency Comments on Water Resources

State Comment: Thanks the Project Team for addressing comments regarding water quality and water permitting issues including impacts to wetlands and streams. Requests that the Project Team continue to investigate ways to reduce the impact on state waters. (0518, 4-01)

Response: *During preliminary engineering and final design, the Project Team will continue to coordinate with the Virginia Department of Environmental Quality (VDEQ) on any future water quality issues.*

Requirements for Submission of a Joint Permit Application

State Comment: All work performed in, over, or under waters within the Commonwealth of Virginia would require the submission of a Joint Permit Application (JPA) to the Virginia Marine Resources Commission (VMRC). VMRC would then act as a clearinghouse, distributing copies of the application to state, local, and federal agencies for review and comments. Detailed engineered plans showing the exact location of all water crossings will be required to determine whether or not a permit will be required. (0518, 4-02)

Response: *The Project Team will coordinate with VMRC on these issues during preliminary engineering and final design.*

Regional Agency Comments

Notice of Need to be Consistent with the Virginia Coastal Zone Management Plan

Regional Comment: DEIS Section 4.2.3.5 states that the project is not in the coastal zone. It is our understanding that Fairfax County is part of the Virginia Coastal Zone, and that consistency with the Virginia Coastal Zone Management Plan should be addressed in the EIS. (0440, 0440-A –9)

Response: *Thank you for the correction. The portion of the Project that extends through Fairfax County is considered to be within the coastal zone. Section 4.2.of the Final EIS has been updated accordingly.*

Local Agency Comments

Addressing Effects on Water Resources in the City of Falls Church

Local Comment: The draft EIS has failed to address the environmental impact to surface and groundwater as it might affect the City [of Falls Church], the City's water distribution system that serves much of the Corridor, and Four Mile Run. (0122, 0122-A-5)

Local Comment: The Draft EIS addresses possible impacts to surface and ground water. Section 4.1.5.2 acknowledges the possibility of ground water degradation from contaminates, but the ground water study does not address Falls Church ground water. (0122, 0122-A –24)

Local Comment: Furthermore, the inventory of surface water sources that might be negatively impacted within the watershed of the affected project area omits the Four Mile Run and its tributaries. This is a significant omission that must be addressed. (0122, 0122-A –25)

Local Comment: Additionally, Section 4.1.3.2 addresses consideration of Fairfax and Loudoun County public water and waste water systems, but omits consideration of possible impact to the Falls Church water system, which not only serves Falls Church City but also a substantial portion of the project area. This omission is very significant and must be addressed by analyzing possible impacts and proposing mitigation measures. (0122, 0122-A –26)

Local Comment: The draft EIS has failed to address the environmental impact to surface and groundwater as it might affect the city's [of Falls Church] water distribution system that serves much of the corridor and Four Mile Run. (0122, 0164-T –6)

> ***Response:*** *The residents of the City of Falls Church obtain their water from the Public Utilities Division of the City of Falls Church Department of Environmental Services, a water distribution agency that purchases water from the Washington Aqueduct Division of the Baltimore District Army Corps of Engineers (WAD). WAD gets its water from the Potomac River through intakes at Great Falls and Little Falls in Maryland. WAD has two water treatment plants, the McMillan and Dalecarlia plants. Generally, Falls Church receives its water from the Dalecarlia plant. None of the improvements proposed under the Locally Preferred Alternative (LPA) would affect the Potomac River or the water distribution system that serves the City of Falls Church. Likewise, groundwater within the City of Falls Church is not expected to be affected.*
>
> *Four Mile Run is situated outside of the study area for water resources. Some of the proposed improvements near the West Falls Church Yard and in the median of the Dulles Connector would be located near an unnamed tributary to Pimmit Run. These water resources do not drain to Four Mile Run. None of the proposed improvements are located close enough to Four Mile Run or its watershed to cause effects. In addition, the water intake pipes for the Great Falls and Little Falls plants are located upstream of Pimmit Run (and well upstream of Four Mile Run).*
>
> *As referenced in Section 4.2 of the Final EIS, best management practices (BMPs) would be employed during construction and operation of the transit improvements. With the use of these BMPs for stormwater management and erosion and sediment control during the construction and operation of the selected alternative, degradation of surface water and groundwater quality would be minimal and be limited to the immediate vicinity of the proposed improvements. Therefore, resources such as the Potomac River, the water supply controlled by the WAD, and Four Mile Run, would not be affected.*

Local Comment: Continuous coordination with the Department of Public Works and Environmental Services and the Department of Planning and Zoning should be maintained to ensure compliance with the requirements of Virginia's Chesapeake Bay Preservation Area Designation and Management Regulations and the County's Chesapeake Bay Preservation Ordinance (to be amended in March 2003). (0479, 0479-L –5)

> ***Response:*** *Thank you for your input. Coordination with these agencies will continue throughout the life of the Project.*

Public Comments

Suggestion to Employ Bio-Retention Techniques

Public Comment: Suggest employing "bio-retention techniques" in stormwater management design. This concept uses vegetative media to filter out contaminants and often decreases pipe sizes and swm pond sizes, as well as looks nicer as vegetation than pavement. I've heard Loudoun county is receptive to this attractive alternative. It can be used in landscaped strips. (0079, 0079-CC-2)

> ***Response:*** *During preliminary engineering and final design, bio-retention techniques will be explored further for possible incorporation into stormwater management design. Furthermore, as referenced in Section 4.2 of the Final EIS, adequate measures for stormwater management would be in accordance with the requirements of the Commonwealth of Virginia, and Fairfax and Loudoun counties that encourage minimization of clearing and use of bio-retention facilities whenever practical.*

Mitigation of Cut-Through Traffic in the Westhampton Neighborhood

Public Comment: The issue of cut-through traffic also raises problems of pollution for the branch of Pimmit Run which goes through the Westhampton Neighborhood. Pimmit Run is a tributary of the Potomac River and therefore is a Water of the United States under the federal Clean Water Act. If cut-through traffic is allowed in Westhampton, leaking gasoline and oil from automobiles will find its way directly into Pimmit Run through the culvert under Grayson Place every time it rains. The branch of Pimmit Run in that area provides a source of drinking water for wildlife in the Westhampton neighborhood including migratory birds which are protected by federal law. We have seen over thirty species of birds, including migratory waterfowl, four species of reptiles, and at least six species of wild mammals on our property alone. Therefore protection of wildlife is another important reason to mitigate to reduce cut-through traffic in the Westhampton neighborhood. (0388, 0388- L-4)

> ***Response:*** *The present condition of Pimmit Run has been rated "Poor" by Fairfax County for both water quality and habitat due to the intense development that surrounds this stream corridor. Concrete-lined channels draining the area surrounding Pimmit Run have already contributed numerous amounts of highway constituents into the stream. Pimmit Run may provide a source of drinking water for wildlife in this area, but the water source is already receiving pollutants from upstream highway runoff. Implementation of the LPA is not anticipated to alter these existing conditions; the wildlife patterns associated with the Pimmit Run corridor would not be altered due to anticipated cut-through traffic.*

Addressing Section 4(f) Regulations in the Tysons Central B Station Area

Public Comment: I could not see any reference to the EQC area that would be taken for the Tysons Central B station area on Westpark Drive. Although it is not a park per se, subject to Section 4(f) it should be sacrosanct with regard to the Fairfax County Comprehensive Plan. (0429, 0429-E –6)

> ***Response:*** *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. This comment concerned the potential effects of Alignment T4, which was eliminated from further consideration after the public and agency review and comment on the Draft EIS.*

Effect on the Difficult Run Watershed

Public Comment: How will construction activities and increased traffic congestion on Hunter Mill Road affect Fairfax County's largest watershed, the fragile Difficult Run Watershed, water and air quality? (0460, 0460-L –8)

Public Comment: For water resources, the Draft EIS states "minor additional long-term effects to water resources, potential additional runoff impacts from increases in allowable density at station/stop areas". Each of these factors needs to be quantified and evaluated, particularly in view of the fragility and burdens placed on scarce water resources in the area and in light of the downstream attributes of Difficult Run. (0510, 4-02)

> ***Response:*** *These effects are discussed in Section 4.2 of the Final EIS. Mitigation of Project-related impacts would be through a series of BMPs. With these BMPs in place, long-term Project-related impacts to water resources would be minimal. As discussed in Chapter 9 of the Final EIS, the mitigation of secondary development effects would be done through the county development permitting processes.*

Effects on Well Water Used by Residents in the Mid-Corridor

Public Comment: Some homes in the Mid-Corridor use well water and depend on the aquifer for water needs. The Draft EIS does not adequately address the potential for aquifer contamination. (0510, 4-06)

> ***Response:*** *Section 4.1 of the Final EIS discusses the Project-related impacts to groundwater resources. Because the Metrorail Extension would result in a small increase in impervious surface, there would be minor effects to the groundwater recharge capacity of the local aquifers. However, this effect would be partially offset by the increased aquifer recharge that would occur as a result of the proposed stormwater management facilities.*

Secondary Development Effects on the Difficult Run Ecosystem

Public Comment: Potential effects due to secondary development on aquatic biota and habitat are summarily stated as "no additional impacts are projected". I find this astounding particularly in light of the fragility of the Difficult Run Ecosystem. The dramatically increased footage of the impervious surfaces in higher-density bonus areas near stations can only result in intensification of runoff, yet the Draft EIS states that there will be no additional impact. (0510, 4-03)

> ***Response:*** *As discussed in Section 4.3 of the Final EIS, since the streams located in the Mid-Corridor have been channelized, and since the Metrorail Extension, and therefore new development, would be located in the median of the Dulles International Airport Access Highway (DIAAH), no additional impacts to aquatic biota are anticipated. Permanent stormwater management ponds would be located along the DIAAH and Dulles Toll Road to replace the grassy swales currently in the median of the DIAAH. These ponds would add a marginal amount of aquatic habitat to the area. However, as discussed in Chapter 9 of the Final EIS, the mitigation of secondary development effects would be done through the county development permitting processes.*

Concern About Run-Off from Stormwater Management Pond

Public Comment: Concerned about a proposed stormwater management facility on part of his property. Concerned that the potential pollutants from run off will stay in the pond and eventually seep into local groundwater. (0464 4-01)

> ***Response:*** *The pollutants in these ponds settle out as solids through the sediment residue at the bottom of the pond. Through regular maintenance of the ponds and protective layers of the pond bottom, the pollutants would be removed without seeping into the local groundwater and underlying aquifers.*

B. Supplemental Draft EIS Comments

Federal Agency Comments

Issues Related to the Chesapeake Bay Resource Management Area

Federal Comment: According to the Northern Virginia Regional Commission, Fairfax County and the Town of Herndon have enacted jurisdiction-wide Chesapeake Bay Resource Management Area (RMA) designations. This designation requires that all development result in a no-net-increase standard for phosphorus loadings, based on the jurisdiction's average imperviousness. In addition, since a Resource Management Area is one of two classifications of a Chesapeake Bay Preservation Area, the threshold for application of the Erosion and Sediment Control Plan is 2,500 square feet of land disturbance, rather than 10,000 square feet in areas not so designated. (0080 0094-7)

Response: *The boundaries of Resource Protection Areas (RPA) have been identified in the Final EIS. A discussion of Chesapeake Bay Preservation Areas including Resource Management Areas (RMA) and RPA can be found in Section 4.2 of the Final EIS and are illustrated in Figure 4.2-4. Impacts to RPAs from the Build Alternatives studied were minimized through an iterative design process.*

State Agency Comments

Consistency with Regulations for Stormwater Management

State Comment: Special attention should be given to post-construction stormwater quality management, according to the Northern Virginia Regional Commission. The project proponents must adhere to the post-development water quality requirements set out in the Virginia Stormwater Management Regulations. (0080 0094-5)

State Comment: A Virginia Water Protection Permit will be required for this project pursuant to 9 VAC 25-210-10 et seq. In addition, because it is likely to disturb one acre or more of land area, the project will require a Virginia Pollutant Discharge Elimination System (VPDES) Stormwater General Permit for Construction Activities. (0080 0094-10)

State Comment: The Marine Resources Commission has permit jurisdiction over any encroachments in, on, or over any state-owned rivers, streams, or creeks. If any portion of the project involves any encroachments channelward of ordinary high water along natural rivers and streams, a permit may be required from the Commission. (0080 0094-11)

State Comment: Pursuant to the Coastal Zone Management Act of 1972, as amended, the applicant agency for federal licensing or permitting is required to certify the consistency of it activities affecting Virginia's coastal resources or coastal uses with the Virginia Coastal Resources Management Program (VCP) (see section 307(c) (1) of the Act and the Federal Consistency Regulations at 15 CFR Part 930, sub-part D, section 930.57. (0080 0094-15)

State Comment: DEQ's Water Division recommends strict adherence to erosion and sediment control practices and stormwater management requirements, and effective monitoring of construction activities to ensure that erosion controls and stormwater management practices are adequately preventing sediment and pollution from entering adjacent surface waters. (0080 0094-2)

State Comment: [T]he project proponents should prepare and implement Erosion and Sediment Control Plans and Stormwater Management Plans that comply with state law. The project proponents are ultimately responsible for achieving project compliance through oversight of on-site contractors, regular field inspection, prompt action against non-compliance, and/or other mechanisms consistent with agency policy. (0080 0094-4)

Response: *All necessary permits required for the implementation of the LPA will be identified through coordination with resource agencies and obtained prior to construction. All Project activities will be completed in accordance with all relevant federal, state, and local laws and regulations.*

State Comment: The Regional Commission also recommends that the proponents explore opportunities, where possible, for retrofit of existing stormwater quantity facilities to stormwater quality facilities through new construction activities. (0080 0094-6)

Response: *As documented in Section 4.2 of the Final EIS, the Project Team will follow the Public Facilities Manual, Virginia Erosion and Sediment Control Handbook, and all other applicable requirements.*

Issues Related to Watershed Management, Wetlands, and Water Quality

State Comment: The document should reference Fairfax County's development of a watershed management plan for the Difficult Run watershed (Section 4.2). (0091 0106-23)

Response: *Thank you for the information. The Project Team will design the Project to appropriate federal, state, and local standards.*

Regional Agency Comments

Issues Related to the Chesapeake Bay Resource Management Area

Regional Comment: Please be advised that Fairfax County and the Town of Herndon have enacted jurisdiction-wide Chesapeake Bay Resource Management Area (RMA) designation. This RMA designation requires that all development result in a no-net-increase standard for phosphorus loadings, based on the jurisdiction's average imperviousness. (0006 0006-1)

Response: *The boundaries of Resource Protection Areas (RPA) have been identified in the Final EIS. A discussion of Chesapeake Bay Preservation Areas including Resource Management Areas (RMA) and RPA can be found in Section 4.2 of the Final EIS and are illustrated in Figure 4.2-4. Impacts to RPAs from the Build Alternatives studied were minimized through an iterative design process.*

Consistency with Regulations for Stormwater Management

Regional Comment: Special attention should be given to post-construction stormwater quality management. The developing agency must adhere to the post-development water quality requirements set forth by the Virginia Stormwater Management Regulations (VR 215-02-00 Part IV and S2.3). Meeting the Virginia Stormwater Management Regulations should comply with the requirements that state agencies meet the local ordinances pursuant to the Virginia Chesapeake Bay Act.

Please refer to the Northern Virginia BMP Handbook for calculation procedures. A copy of the handbook is available on NVRC's website, www.novaregion.org. (0060 0006-2)

Response: *All necessary permits required for the implementation of the LPA will be identified through coordination with resource agencies and obtained prior to construction. All Project activities will be completed in accordance with all relevant federal, state, and local laws and regulations.*

Regional Comment: We would also suggest that, where possible, opportunities for retrofit of existing stormwater quantity facilities to stormwater quality facilities through new construction activities should be explored. NVRC's Guidebook for Maintaining BMPs in Northern Virginia is available, without charge, should you need it, and can also be downloaded from our website, or call me if you would like to receive a copy to use as a reference. (0060 0006-3)

Response: *As documented in Section 4.2 of the Final EIS, the Project Team will follow the Public Facilities Manual, Virginia Erosion and Sediment Control Handbook, and all other applicable requirements.*

Local Agency Comments

Issues Related to Watershed Management, Wetlands, and Water Quality

Local Comment: Please ensure that all the elements of the RSCOD [River and Stream Corridor Overlay District] have been taken into account when determining impacts to water resources. (0084 0099-4)

Response: *All necessary permits required for the implementation of the LPA will be identified through coordination with resource agencies and obtained prior to construction. All Project activities will be completed in accordance with all relevant federal, state, and local laws and regulations.*

Local Comment: The County prefers any wetland impacts incurred in Loudoun County from the proposed project be mitigated within the Suburban Policy Area. However, if a wetland mitigation bank is not available within the Suburban Policy Area at the time the impacts are incurred County staff prefers that impacts to wetlands within Loudoun County be mitigated at the Bull Run Wetland Bank as shown on Figure 4.2-2. (0084 0099-5)

Response: *DRPT and WMATA will continue to coordinate with Loudoun County regarding the mitigation of wetland impacts within the County.*

Public Comments

Stormwater Management Ponds Locations and Potential Effects

Public Comment: The second issue is the storm water pond. This decision, the location of it, we believe will cause various health and safety hazards for children, will remove valuable ground cover, and will have an ecological impact on the wildlife and provide an insect breeding ground. We recommend that the pond be constructed in the cul-de-sac at the end of Chathams Ford Drive, where the impact would be far less. (0174, 0174-T –6)

Public Comment: The proposed location of the [stormwater] pond will cause various health and safety hazards for children, will also remove valuable ground cover and will provide an insect breeding ground. Construct the pond in the cul-de-sac at the end of Chathams Ford Drive where the impact would be less direct. (0174, 0300-L –12)

Public Comment: The Draft Environmental Impact Statement and Proposed General Plans for the project propose that a stormwater pond be created on the property of 9620 Chathams Ford Drive. This property backs up to the Toll Road. In order to create the pond, at least 100 trees will have to be cut down. Our concerns about the pond are as follows:

1. It will remove valuable ground cover in the form of the 100 trees.
2. These trees also provide sound protection to 9620 Chathams Ford Drive and to other homes in the neighborhood. The trees are also an important visual barrier from the Toll Road.
3. The pond will also create a drowning hazard to children because it will hold standing water. Chathams Ford Drive is already hazardous to children because of inadequate safety barriers between the street and the Toll Road.
4. The pond will create a breeding ground for mosquitoes and other predatory insects, which multiply rapidly in standing water. This situation raises the threat of West Nile virus, especially for senior citizens and immuno-compromised residents who live in the neighborhood.

5. In addition, it will create a place where children may fall and injure themselves because of the depth of the pond.
6. The pond will impair the value of 9620 Chathams Ford Drive.
7. Finally, the pond will destroy one of the last remaining natural habitats in the area. Destruction of the trees to construct the pond will take away shelter and food from the deer, and likely will drive them more actively onto streets and highways, thereby creating life-threatening conditions for both humans and animals. (0174, 0300-L –13)

Public Comment: In addition, the proposed Stormwater pond to be located on the property of 9620 Chathams Ford Drive would remove approximately 100 trees which provide at least some sound protection. (0174, 0300-L –8)

Public Comment: We recommend that the Task Force consider moving the pond to the cul-de-sac at the end of Chathams Ford Drive. This area will have less of a direct impact and no additional homes can be built there because of its proximity to the Toll Road. (0174, 0300-L –14)

Public Comment: Although the "pond" is said to be a dry pond, I have consulted a licensed professional engineer who was formerly employed by a division of Fairfax County that maintained these ponds. He informed me there will always be some moisture that will serve as an excellent breeding ground for mosquitoes. This situation raises the threat of West Nile Virus, especially for the senior citizens and immunocompromised who live in our [Chathams Ford] neighborhood. (0383, 0383- L- 3)

Public Comment: The pond [Chathams Ford] will create a drowning hazard for my children and other neighborhood children. I understand the "pond" will not hold water all the time, however, after storms, this area will be a drowning hazard of which the county and state will be directly liable for. It will also create hazards of which my children and other neighborhood children can fall and injure themselves. (0383, 0383- L-2)

Public Comment: The acquisition of my land and the construction of this pond will severely impact the monetary resale value of my home [Chathams Ford]. My wife and I had planned on remaining in this home for the next 20-30 years. It is very difficult to predict the monetary impact over this time period, however, I would estimate it to be in excess of one million dollars. (0383, 0383- L-4)

Public Comment: My wife and I are in favor of the Rapid Transit Project, however, we are vehemently against the acquisition of our property for the construction of a storm water retention pond. If the pond were located at the end of Chathams Ford Drive in the vacant cul de sac, this would provide for minimal resident disruption and impact. This area is not adjacent to any homes. (0383, 0383- L-6)

Public Comment: This letter is written in regards to the proposed Dulles Corridor Rapid Transit Project. My wife and I reside in Vienna and our backyard borders the Dulles Toll Road. It is proposed that approximately 1 acre of our land be acquired for the construction of a storm water retention pond if the transit project is approved for Metrorail service. The construction of this retention pond will adversely affect our lives and property in a drastic manner. The following points describe the severe impact that this portion of the project will have on our family and our property: The construction of the "pond" will remove valuable mature trees and ground cover. These trees are the only natural sound and visual protection from the Toll Road. Removal of these trees will provide not only the eye sore of the Toll Road but will also increase the already intolerable noise from the highway. At this time, no sound wall/barrier exists in the neighborhood nor is there a plan for the construction of a wall in the Environmental Impact Statement. (0383, 0383-L –1)

Response: *The locations shown in the General Plans of Best Management Practice (BMP) and Stormwater Management (SWM) ponds throughout the corridor are approximate and were included to illustrate that a potential need for one of these facilities exists in the vicinity of the location shown. During preliminary engineering, a comprehensive drainage study will be undertaken for the entire corridor to address final locations of all BMP and SWM ponds. This effort should result in some facilities being eliminated, consolidated, or relocated to further*

minimize impacts to the adjacent areas. See the final General Plans (Final EIS Volumes IV (Line) and V (Facilities)) for more information.

Issues Related to Watershed Management, Wetlands, and Water Quality

Public Comment: That Phase 1 would not adversely affect streams and water quality, and that a full-project would only affect 245 linear feet of streams and water quality (E.g., at TABLE 2-2). Again, this claim fails to evaluate the protracted impact of a massive construction project, the increase in impervious surfaces while construction is underway, and the likely shifting of vehicular traffic onto non-toll roads if Route 267 tolls increase as a funding mechanism. (0068 0173-20)

Response: *The Final EIS provides an estimate of the direct impacts to streams and wetlands within the corridor that would be caused by the Project based on current design assumptions. This information will be updated and refined as necessary as part of preliminary engineering and final design. Both Section 4.2 of the Final EIS and the Natural Resources Technical Report (June 2002) provide a detailed explanation of the methodology used to calculate stream and wetland impacts in the corridor. Both the Full LPA and the Wiehle Avenue Extension would be constructed in accordance with all relevant federal, state, and local laws and permitting regulations. DRPT and WMATA have committed to use accepted Best Management Practices (BMPs) to ensure that areas other than those directly impacted would not be affected by the construction and operation of the Project.*

Public Comment: Moreover, the claim is all the more suspect since Phase 2 of the envisioned project goes through wetlands throughout the Materials Road-Greenway-Anane Way areas (Sheet 10) and various project sites abut or go through wetlands shown in Sheet 11. (0068 0173-21)

Response: *The potential long-term impacts to wetlands caused by the Project were identified and calculated in coordination with the U.S. Environmental Protection Agency (EPA), the U.S. Army Corps of Engineers, and the Virginia Department of Environmental Quality. This information will be updated and refined as necessary throughout preliminary engineering and final design. The Project would be constructed in accordance with all relevant federal, state, and local laws and permitting regulations. DRPT and WMATA have committed to use accepted Best Management Practices (BMPs) to ensure that areas other than those directly impacted would not be affected by the construction and operation of the Project.*

Public Comment: not to mention the negative environmental impact that widening [Wiehle] will inflict on Lake Anne and its drainage system. (0105 0123-3)

Response: *Lake Anne is located outside the study area for water resources and is not part of any of the drainage systems that would be affected by the proposed improvements associated with the Project. DRPT and WMATA have committed to use accepted Best Management Practices (BMPs) during construction and operation of the proposed Full LPA and the Wiehle Avenue Extension. With the use of these BMPs for stormwater management and erosion and sediment control, degradation of surface water quality would be minimal and would be limited to the immediate vicinity of the proposed improvements. Therefore, resources such as Lake Anne would not be affected.*

Public Comment: Our final concern is one of drainage. The runoff of water from the very steeply graded existing berm has caused some major drainage problems in the back of our property. We are at a low spot along the Dulles Connector Road corridor and the runoff from the berm along the entire section of homes in our neighborhood ends up accumulating at the back of our property. During this admittedly very wet year we had standing water in the back along the berm area all year long, which resulted in an infestation of mosquitoes. We would hope that during the construction phase the drainage problems at the back of the properties in our area will be addressed. (0081 0096-2)

Response: *The Dulles Corridor Rapid Transit Project is not responsible for mitigating existing drainage problems along the corridor. If the area in question is disturbed by any grading associated with temporary or permanent facilities of the Project, the area will be provided adequate drainage during and following construction in compliance with all applicable drainage codes and standards.*

Public Comment: The adoption of the Wetland, EQC and RPA standards by Fairfax and Loudoun Counties may conflict with the objective of providing concentrated, mixed use, high density projects at rail stops. The Tysons East Station will provide a challenge to balance the Scotts Run and Pimmit Run RPAs and yet maximize development densities. Provisions such as "no net loss" of wetlands, EQCs and RPAs provision must be adopted to meet both environmental and smart growth objectives. Compensatory replacement area(s) or prorate share contributions for downstream channel stabilization projects should be limited to the Scotts Run Stream Valley below the DAAR and connector. (0113 0132-2) (0123 0158-3)

Response:*. DRPT and WMATA will continue to coordinate with both Fairfax and Loudoun counties and property holders regarding these issues during preliminary engineering and final design.*

Impacts on Water Resources caused by Ancillary Development

Public Comment: That Phase 1 will result in "Reduced Impervious" areas as compared with the full LPA project (i.e., described as "more impervious") (e.g., at TABLE 2-2). Defensible, informative data quantifying the incremental addition of impervious surfaces from the current baseline needs to be presented, and its impact assessed. Further, the impact of a protracted construction period in this regard needs to be quantified and evaluated. (0068 0173-22)

Public Comment: 4.2, page 4-4. The Board of Supervisors did not adopt IDA for Tysons which would have provided a mechanism for developing in areas adjacent to stations that had been designated for preservation based on environmental factors. Therefore special considerations for RPAs and EQCs around the four Tysons stations must be carefully coordinated. Discussions of no net loss mitigation by providing downstream improvements to offset RPA encroachments at rail stations appears to be an acceptable alternative to the environmental community. Wetland mitigation will be addressed on a case by case basis through the Corps of Engineers, but mitigation will be required for Tysons East Station and the WEST*GROUP master plan does not contemplate onsite mitigation. (0113 0132-7)

Public Comment: special considerations for RPAs and EQCs around the four Tysons stations must be carefully coordinated. Discussions of no net loss mitigation by providing downstream improvements to offset RPA encroachments at rail stations appears to be an acceptable alternative to the environmental community. Wetland mitigation will be addressed on a case by case basis through the Corps of Engineers, but mitigation will be required for Tysons East Station and the WEST*GROUP master plan does not contemplate onsite mitigation. (0123 0158-9)

Response: *The Final EIS provides an estimate of the direct impacts to streams and wetlands within the corridor that would be caused by the Project based on current design assumptions. This information will be updated and refined as necessary during preliminary engineering and final design. Both Section 4.2 of the Final EIS and the Natural Resources Technical Report (June 2002) provide a detailed explanation of the methodology used to calculate stream and wetland impacts in the corridor. Both the Full LPA and Wiehle Avenue Extension would be constructed in accordance with all relevant federal, state, and local laws and permitting regulations. DRPT and WMATA have committed to use accepted BMP to ensure that areas other than those directly impacted would not be affected by the construction and operation of the Project. DRPT and WMATA will continue to coordinate with both Fairfax and Loudoun counties and property owners regarding these issues during preliminary engineering and final design.*

4.3 Aquatic Biota and Habitat

A. Draft EIS Comments

Federal Agency Comments

Concern About Effects From Rail Yard Leads at Site 7 and 15

Federal Comment: Concerned that the rail yard lead for Site 15 would cut through 2,500 feet of forested wetlands and cross Horsepen Run. Feel that Site 7 is the most viable both operationally and environmentally since it would have floodplain but not wetland impacts. Suggest that the Project Team coordinates with the U.S. Army Corps of Engineers and VDEQ to provide documentation of impacts in the Final EIS. The Final EIS must demonstrate that Site 15 is the least damaging practicable alternative if it were to be approved. (0485, 4-01)

> ***Response:*** *The Project Team is aware of these concerns and will continue to coordinate with the Federal Aviation Administration (FAA) during preliminary engineering and final design. Every effort will be made to avoid and/or minimize impacts to natural resources during the design process. Yard Site Y7 was eliminated from consideration after the public and agency review and comment on the Draft EIS.*

B. Supplemental Draft EIS Comments

Public Comments

Affected Upland
Public Comment: f. A detailed evaluation of affected prime upland areas and streams with glade habitats needs to be presented and assessed for Phase 1 construction. (0068 0173-23)

> ***Response:*** *Sections 4.3 and 4.4 of the Final EIS describes the potential effects of the full LPA and the Wiehle Avenue Extension on aquatic and terrestrial biota and habitats in the corridor. Additional detail on the analysis was provided in the Natural Resources Technical Report (June 2002). Impacts to upland areas are minimal, most of which are of limited importance for terrestrial wildlife and serve mostly as foraging areas. There would be no additional effects to aquatic habitat as a result of the Wiehle Avenue Extension. If the Full LPA is not implemented by 2025, then an additional 0.1 acres of wetland W-80 would be affected near the Herndon-Monroe Park-and-Ride to accommodate an expansion of park-and-ride capacity.*

4.4 Terrestrial Biota and Habitat

A. Draft EIS Comments

State Agency Comments

Mitigate Effects on Forest Lands During Construction

State Comment: Forest and Tree Protection. According to the Department of Forestry, this project will not significantly affect forest lands of the Commonwealth. In order to protect trees in project construction areas from the effects of this project, the trees should be marked and fenced at least to the dripline or the end of the root system, whichever extends farther from the tree stem. Marking should be done with highly visible ribbon so that equipment operators see the protected areas easily. Parking and stacking of heavy equipment, construction materials, or soil stockpiles near trees can damage root systems by compacting the soil. Soil compaction, from weight or vibration, affects root growth, water and nutrient uptake, and gas exchange. If parking and stacking are unavoidable, temporary crossing bridges, or mats to minimize soil compaction and mechanical injury to plants, should be used. Soil stockpiles should be covered to prevent

soil erosion and fugitive dust. (0407, 0407-A –12)

> ***Response:*** *The Project Team will comply with federal and state laws and will implement BMPs during construction of the Project.*

Public Comments

Effect of Stormwater Facilities on Natural Resources

Public Comment: The [Stormwater management] pond [near Chathams Ford] will destroy one of the last remaining natural habitats in the area. Destruction of the trees to construct the pond will take away shelter and food from the deer, and likely will drive them more actively into streets and highways, thereby creating life-threatening conditions for both humans and animals. (0383, 0383- L-5)

> ***Response:*** *Construction of the pond would reduce the available habitat for deer, but not to the point that deer would be forced onto nearby roads. Several wildlife corridors are accessible from the Chathams Ford Road vicinity and include Difficult Run, Wolftrap Run, and Courthouse Spring. Forested corridors parallel the Dulles Toll Road from Beulah Road to Route 7 providing a transportation route for wildlife.*

Public Comment: Draft EIS does not refer to effects to terrestrial biota and habitat from 888% increase in density at mid-corridor stations. (0510, 4-04)

> ***Response:*** *Secondary effects to terrestrial habitat would be minimal and would primarily be the result of clearing and grading areas of habitat. See Chapter 9 of the Final EIS for a discussion of the secondary and cumulative effects of the Project.*

Replace Trees Destroyed During Construction

Public Comment: Provide replacement trees within the corridor for those destroyed. Use sustainable species for the area's climate and soils. (0487 4-01)

> ***Response:*** *The Project Team will comply with federal and state laws and will implement BMPs during construction.*

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received.

4.5 Rare, Threatened, and Endangered Species

A. Draft EIS Comments

State Agency Comments

Timing of Survey for Rare, Threatened, and Endangered Species

State Comment: Commenter would like to look at the survey for rare, threatened, and endangered species performed by Coastal Resources, Inc. in April and August of 2000, prior to its inclusion in the Final EIS. Commenter needs to verify the results and verify that the survey was conducted during the appropriate time of year. Concerned that the rare diabase plant, earleaf foxglove *(Agalinis auriculata)* may have been missed in the August survey due to the difficulty in verifying the plant in its vegetative state. The actual flowering period for the plant is in September. (0519, 4-01)

Response: *According to the Manual of Vascular Plants of Northeastern United States and Adjacent Canada by Gleason and Cronquist (New York Botanical Garden, 1991), the flowering period of the ear-leaf foxglove (Agalinis auriculata) occurs between August and September. All field surveys relating to rare, threatened, and endangered species known to occur in diabase glades were based on the information presented in this manual. The survey for the presence of state and/or globally rare diabase glade plant species was conducted on Dulles Airport property for potential Yard Site 15 on August 16, 2002. The Project Team will forward the documentation to Rene Hypes at the Department of Conservation and Recreation as part of the agency coordination process.*

DCR Recommendation for Survey of Potential Suitable Habitat For Rare Diabase Plans

State Comment: Natural Heritage and Wildlife Resources. According to the Department of Conservation and Recreation (DCR), "natural heritage resources" are defined as the habitat of rare, threatened, or endangered plant and animal species, unique or exemplary natural communities, and significant geological formations. According to DCR files, several rare plants may occur in project locations if suitable habitat is present. These plants are typically associated with prairie vegetation and inhabit semi-open diabase glades in Virginia. Diabase glades are characterized by historically fire-dominated grassland vegetation on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flatrock, a hard, dark-colored volcanic rock, is found primarily in northern Virginia and located within the geologic formation known as the Triassic Basin. Where the bedrock is exposed, a distinctive community type of drought-tolerant plant occurs. Diabase flatrocks are extremely rare natural communities that are threatened by activities such as quarrying and road construction. In Northern Virginia, diabase supports occurrences of several globally rare and state rare plant species (see the "Definition of Abbreviations" on pages 2 and 3 of the attached August 1, 2002 comments from DCR). These include: earleaf foxglove (*Agalinis auriculata*) white heat aster (*Aster ericoides*), blue-hearts (*Buchnera americana*), hairy beardtongue (*Penstemon hirsutus*), downy phlox (*Phlox pilosa*), stiff goldenrod (*Oligoneuron rigidum var. rigidum*), marsh hedgenettle (*Stacbys pilosa var. arenicola*). The earleaf foxglove is currently tracked as a species of concern by the U.S. Fish and Wildlife Service; however, this designation has no legal status, according to DCR. Because the project corridor has the potential to support populations of these natural heritage resources, DCR recommends an inventory of suitable habitat in the study area. With the survey results, DCR can more accurately evaluate potential resource impacts and recommend specific protection measures to minimize the impacts. In this regard, the Department of Conservation and Recreation's Division of Natural Heritage employs biologists who are qualified and available to conduct inventories for rare, threatened, and endangered species. We recommend that the project manager (Department of Rail and Public Transportation, the Washington Metropolitan Area Transit Authority, or other project management agency) contact the Division of Natural Heritage (Christopher Ludwig, Natural Heritage Inventory Manager, telephone (804) 371-6206) to discuss arrangements for field survey work. The Department of Conservation and Recreation has not surveyed any sites within the project area (see Draft EIS, pages 4-77 through 4-81, section 4.5.3), but recommends doing so before September ends if possible. The Draft EIS concludes that there is no suitable habitat for rare diabase plants (page 4-81); this conclusion should be re-evaluated during the appropriate season. (0407, 0407-A –2)

State Comment: According to the information currently in our files, several rare plants, which are typically associated with prairie vegetation and inhabit semi-open diabase glades in Virginia may occur at this location if suitable habitat is present. Diabase glades are characterized by historically fire-dominated grassland vegetation on relatively nutrient-rich soils underlain by Triassic bedrock. Diabase flatrock, a hard, dark-colored volcanic rock, is found primarily in northern Virginia counties and is located within the geologic formation known as the Triassic Basin. Where the bedrock is exposed, a distinctive community type of drought-tolerant plants occurs. Diabase flatrocks are extremely rare natural communities that are threatened by activities such as quarrying and road construction (Rawinski, 1995). (0407, 0407-A –25)

State Comment: In Northern Virginia, diabase supports occurrences of several global and state rare plant species: earleaf foxglove (*Agalinis auriculata*, G2/S1/SOC/NS), white heath aster (*Aster ericoides*, G5/S2/NF/NS), blue-hearts (*Buchnera americana*, G3G4/S1/NF/NS), hairy beardtongue (*Penstemon hirsutus*, G4/S2/NF/NS), downy phlox (Phlox pilosa, G5T5/S2/NF/NS), stiff goldenrod (*Oligoneuron*

rigidum var. rigidum, G5/S2/NF/NS), marsh hedgenettle (*Stacbys pilosa var. arenicola*, G5/S1/NF/NS). Please note that earleaf foxglove is currently tracked as a species of concern by the United States Fish and Wildlife Service (USFWS); however, this designation has no official legal status. (0407, 0407-A –26)

State Comment: Due to the potential for this site to support populations of natural heritage resources, DCR recommends an inventory of suitable habitat in the study area. With the survey results we can more accurately evaluate potential impacts to natural heritage resources and offer specific protection recommendations for minimizing impacts to the documented resources. DCR-Division of Natural Heritage biologists are qualified and available to conduct inventories for rare, threatened, and endangered species. Please contact J. Christopher Ludwig, Natural Heritage Inventory Manager, at (804) 371-6206 to discuss arrangements for field work. A list of other individuals who are qualified to conduct inventories may be obtained from the USFWS. Any absence of data may indicate that the project area has not been surveyed, rather than confirm that the area lacks other natural heritage resources. DCR's Biological and Conservation Data System is continuously revised. Please contact DCR for an update on this natural heritage information if a significant amount of time passes before it is utilized. (0407, 0407-A –27)

State Comment: The Draft Environmental Impact Statement discusses some of these issues in 4.5.3: Existing Conditions, pp. 4-77 thru 4-81, and states on page 81, the indication of the "absence of suitable habitat for rare diabase plants". That should be re-evaluated with a survey during the appropriate season. DCR has not surveyed any sites within the project area, but recommends doing so either this month or during September, if possible. As stated above, DCR-Division of Natural Heritage biologists are qualified and available to conduct inventories for rare, threatened, and endangered species. Please contact J. Christopher Ludwig, Natural Heritage Inventory Manager, at (804) 371-6206 to discuss arrangements for field work. (0407, 0407-A –28)

> ***Response:*** *As documented in Section 4.5f the Final EIS, the Project Team has delineated the areas where suitable habitat to support the rare plants referenced above would occur. It was determined that one area, which could be developed under the Metrorail Extension, could contain rare plants associated with diabase glades.*
>
> *Mr. Lugwig of the Department of Conservation and Recreation's Division of Natural Heritage was contacted and agreed to allow a wildlife biologist from Coastal Resources, Inc., a member of the Project Team, conduct an assessment of potential diabase habitat to determine the absence or presence of Rare, Threatened, or Endangered (RTE) plant species. Surveys were conducted based on flowering periods of the RTE plant species, which occurred in April and August 2002. Survey results indicated that there were no RTE plant species found within the study area.*

Statement of No Comment from the Department of Agriculture and Consumer Services

State Comment: The Department of Agriculture and Consumer Services, which is responsible for protection of state-listed plant and insect species, indicates that it has nothing to add to the discussion of rare, threatened, and endangered species (Draft EIS, pages 4-76 through 4-81, section 4.5). (0407, 0407-A –3)

> ***Response:*** *Thank you for your input.*

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received.

4.6 Air Quality

A. Draft EIS Comments

Federal Agency Comments

Project Will Help Improve Air Quality by Reducing Auto Trips

Federal Comment: Projected opening year ridership is estimated to be 27,000 to 72,000 average weekday riders depending on the alternative chosen. This project will provide a clean air alternative transportation mode for many commuters and travelers. (0303, 0303-A –2)

> ***Response:*** *If the Dulles Corridor Rapid Transit Project were to reduce auto trips in favor of transit, then a reduction in regional emissions and pollutant concentrations would also be expected*.

Virginia DEQ's Statement that Build Alternatives are Preferable to No Build

State Comment: Air Quality. According to DEQ's Division of Air Program Coordination (hereinafter "DEQ's Air Division"), the project is in an ozone non-attainment area, which means that the project managers should take all precautions to limit the emissions of volatile organic compounds (VOCs) and oxides of nitrogen (NOx). Detailed modeling studies have established that none of the alternatives under consideration will significantly affect air quality. It appears to us that any of the "build" alternatives would be preferable to the no-action alternative, given the widely acknowledged beneficial air quality impacts of improved mass transit, particularly in the Northern Virginia ozone non-attainment area. (0407, 0407-A –6)

> ***Response:*** *In addition to the decrease in the exhaust emission factors from 2000 to 2025 as a result of the Federal Motor Vehicles Emission Control Program), the Dulles Corridor Rapid Transit Project is also expected to improve the air quality in the region due to the diversion of passenger vehicles to transit. As stated in Section 4.6 of the Final EIS, the Dulles Corridor Rapid Transit Project is included in the Financially Constrained Long Range Plan, which conforms to the federally approved State Implementation Plan (SIP). The Dulles Corridor Rapid Transit Project is presumed to conform to the SIP by reducing regional emission levels under implementation of the LPA.*

Local Agency Comments

Build Rail in the Dulles Corridor to Help Improve Air Quality

Local Comment: The summer of 2002 has been one of the worst in terms of air quality as measured by Code Red days for the region. It is time to cease debate and studies. The matter of relieving congestion and addressing the severe damage to the region's air quality requires that we act now. This project is long overdue. It is time to build rail in the Dulles Corridor, now. (0437, 0437-E –3)

> ***Response:*** *The Dulles Corridor Rapid Transit Project is expected to improve the air quality in the region due to the diversion of passenger vehicles to transit.*

Local Comment: The public hearing report should include a discussion of the extent to which each build alternative would contribute to the attainment of air quality standards, particularly as related to emissions of ozone precursors. One would expect ozone benefits to be greatest for those alternatives that will have the highest transit capacity, particularly if the benefits of high density, transit-oriented, development near transit stations are considered. The DEIS does not, however, address this issue. The DEIS should, ideally, identify differences among alternatives in terms of emissions of ozone precursors (or some surrogate, such as vehicle miles traveled in the region). (0479, 0479-L –7)

Response: *In addition to the decrease in the exhaust emission factors from 2000 to 2025 as a result of the Federal Motor Vehicles Emission Control Program (, the Dulles Corridor Rapid Transit Project is also expected to improve the air quality in the region due to the diversion of passenger vehicles to transit. As stated in Section 4.6 of the Final EIS, the Dulles Corridor Rapid Transit Project is included in the Financially Constrained Long Range Plan, which conforms to the federally approved State Implementation Plan (SIP). Therefore, the Dulles Corridor Rapid Transit Project is presumed to conform to the SIP by reducing regional emission levels. If the Dulles Corridor Rapid Transit Project were to result in a reduction in regional emissions of VOC and NOx, then a reduction in ozone concentrations would also be expected.*

Public Comments

Statements on Effects on Air Quality of Metrorail Extension Versus BRT Alternative

Public Comment: Air quality is a very important consideration to us. We'd like to point out that metrorail will not start improving air quality until it begins service, which will be at least 2010 and we think much later. BRT, on the other hand, which uses compressed natural gas buses, CNG buses, can be in operation soon and can bring relief to this foul air we're breathing today. (0138, 0138-T –6)

Public Comment: It is our understanding that due to a recent ruling in a federal appeals court related to extending the clean air deadline for the Washington, DC area, the region will soon be re-designed as "serious nonattainment"' for ozone pollution. This action demonstrates the deterioration of the air quality in the region and will require additional controls to address smog. Ozone is the principle component of ground-level smog. It is formed when hydrocarbon and nitrogen oxide pollution from vehicles, power plants, refineries and other sources react in the atmosphere in the presence of sunlight. Ozone is a powerful oxidizing agent that damages lung tissue. Recent research has found that health effects from ozone include increased respiratory symptoms, damage to cells of the respiratory tract, pulmonary inflammation, declines in lung function, increased susceptibility to respiratory infections, increased risk of hospitalization and premature death. Groups most sensitive to ozone pollution are children, people with chronic respiratory disease like asthma or emphysema, people who exercise or work outdoors, and "responders", people who, for reasons that remain unknown, are more sensitive to ozone pollution. Fifty-two percent of nitrogen oxide emissions in the northern Virginia area come from on-road mobile sources. The expansion of rail in the Dulles Corridor will help reduce vehicle miles traveled and support development that is not road-centered but designed to encourage bike and pedestrian friendly modes of travel. The American Lung Association of Virginia believes these outcomes will help improve the quality of the air in the region. Thank you for the opportunity to share our support for rail today! (0198, 0198-L –2)

Public Comment: Air quality is enhanced by MetroRail. The typical suburban automobile gets about 22.5 passenger-miles per gallon of fuel. The typical urban bus gets 31 such passenger-miles. Light Rail produces 41 passenger-miles per gallon if the electricity is made from oil. MetroRail and commuter rail get 54 passenger-miles per gallon of fuel. When a motorist converts to transit there is a saving of at least 58 percent. Fewer trips may be made, increasing the saving. (0013, 0013-L –35)

Public Comment: Air quality, which I said before, is enhanced by metrorail. The typical suburban automobile gets 22.5 passenger miles pre gallon of fuel. The typical urban bus gets 31 such passenger miles, depending on what they're using. Light rail produces 41 passenger miles per gallon if the electricity is made from oil. Metrorail and commuter rail get 54 passenger miles per gallon of fuel. When a motorist converts to transit, there is a savings of at least 58 percent. Fewer trips may be made. That also increases savings. (0244, 0244-T –3)

Response: *From an air quality standpoint, the Dulles Corridor Rapid Transit Project is expected to improve the air quality in the region due to the diversion of passenger vehicles to transit, which would result in an overall reduction in vehicle miles traveled, as discussed in Section 4.6 of the Final EIS.*

EIS Should Reflect Positive Air Quality Effects of Reducing Carbon Monoxide (CO)

Public Comment: From a review of the Air Quality Technical Report, it appears that only the intersections in the vicinity of the corridor were modeled. Because many of these are in close proximity to the future station sites, many of these intersections would be expected to be encumbered with additional station generated traffic. The good news from the report is that despite the additional station generated traffic added by the project, air quality won't be any worse at these intersections. Just because the EPA and VDEQVDEQ don't REQUIRE an assessment of CO concentrations from highway mainlines, the air quality improvement resulting from the elimination or trip length reduction of up to 38,000 trips per day from the road system along the corridor has got to be significant. Clearly, this very important benefit needs to be quantified and reflected in the EIS. (0387, 0387-L –18)

> ***Response:*** *Agency requirements focus on intersections as the "worst case" (i.e., highest carbon monoxide (CO) concentrations) for assessment of Project impacts. Compared to intersection conditions, the more efficient operation of vehicle engines at highway mainline speeds, along with the greater right-of-way widths, results in much lower CO levels at locations where people may be exposed. If the Dulles Corridor Rapid Transit Project were to reduce auto trips on highway mainlines, then a reduction in CO levels near the mainlines would be expected. At the regional level, a reduction of auto trips in favor of transit would be expected to result in a reduction in overall CO emissions, which would benefit air quality.*
>
> *The adverse levels of CO due to traffic on highway mainlines are very unlikely to occur because of the relatively low emission rates from recent model year vehicles as well as the distances from the travel lanes to receptors at or beyond the right-of-way boundary. For these reasons, EPA and the Virginia Department of Environmental Quality do not require assessment of CO concentrations from highway mainlines.*

Conclusion that the Build Alternatives Will Reduce CO

Public Comment: The conclusion that none of the transit alternatives will reduce CO is ridiculous. How can the reduction of as many as 38,000 trips NOT reduce pollution? That's simply not possible. The air quality improvements associated with transit improvements such what's proposed in the Dulles Corridor are well known and essential if the Washington area is to solve its air quality problem. (0387, 0387-L –17)

> ***Response:*** *In addition to the decrease in the exhaust emission factors from 2000 to 2025 as a result of the Federal Motor Vehicles Emission Control Program, the Dulles Corridor Rapid Transit Project is also expected to improve the air quality in the region due to the diversion of passenger vehicles to transit. As stated in Section 4.6 of the Final EIS, the Dulles Corridor Rapid Transit Project is included in the Financially Constrained Long Range Plan, which conforms to the federally approved SIP. Therefore, the Dulles Corridor Rapid Transit Project is presumed to conform to the SIP by reducing regional emission levels.*
>
> *Additionally, the air quality analysis focused on "worst-case" locations where localized traffic impacts of the Dulles Corridor Rapid Transit Project would be expected to result in the highest CO concentrations. At the regional level, a reduction of auto trips in favor of transit would be expected to result in a reduction in overall CO emissions, which would benefit air quality.*

Air Quality Improvements Will Come From Technological Advances, Not Rail

Public Comment: None of the rail proposals do anything for air quality and the impact on the environment is greater than with buses. (0112, 0269-M-8)

Public Comment: That the study says that this project provides no long-term regional air quality benefit, that technological advances, not transit, generate the real benefits over the next 25 years. (0446, 0146-T –10)

Public Comment: That the DEIS says this project provides no long-term regional air quality benefit. Technological advances, not transit, generate the real benefits over the next 25 years. (0446, 0218-M – 10)

> ***Response:*** *In addition to the decrease in the exhaust emission factors from 2000 to 2025 as a result of the Federal Motor Vehicles Emission Control Program, the Dulles Corridor Rapid Transit Project is also expected to improve the air quality in the region due to the diversion of passenger vehicles to transit. As stated in Section 4.6 of the Final EIS, the Dulles Corridor Rapid Transit Project is included in the Financially Constrained Long Range Plan, which conforms to the federally approved SIP. Therefore, the Dulles Corridor Rapid Transit Project is presumed to conform to the SIP by reducing regional emission levels.*

EIS Should State that Air Quality Would Worsen Under Metrorail Extension

Public Comment: The final EIS should clearly state that as a result of the implementation of rail in the Dulles Corridor, air quality would be worse than what would be expected without rail. The basis of this statement is that under both scenarios (e.g., with and without rail) air quality would supposedly improve because EPA requirements for decreased automobile emissions. The draft EIS states that with rail, traffic in the corridor would increase over what would be expected without rail. Ergo, the level of pollution that could be expected as a result of implementation of rail would be higher than that expected without rail. (0203, 0384-L –1)

> ***Response:*** *The air quality analysis does not support the reviewer's assertion that air quality would be worse under the Metrorail Alternative than under the No Build Alternative. As shown in Section 4.6 of the Final EIS, predicted maximum CO concentrations differ only slightly between the No-Build Alternative and the Metrorail Alternative. All of the maximum CO levels are well below the National Ambient Air Quality Standards (NAAQS). Localized increases in traffic volumes predicted along the access routes to rail stations and Park-and-Ride facilities are responsible for slightly higher CO levels at some locations. Similarly, other locations, which would experience decreases in traffic volumes because drivers would choose to ride Metrorail, would experience slightly lower CO levels.*
>
> *Furthermore, the Final EIS shows that CO levels are predicted to improve under both the No-Build Alternative and the Metrorail Extension, compared to the existing conditions, because of EPA requirements for decreased vehicle emissions. This improvement will occur with all of the alternatives and is not an impact of the project.*

Buses Will Not Help Improve Air Quality

Public Comment: The National Capital area suffers an air pollution problem that may bring sanctions under the Clean Air Act as amended. Buses are not clean. Greatly improved buses have been developed, but some are too heavy to comply with highway weight laws and pavement strength. Some are too costly to maintain. All are experimental when considered in relation to the fifteen (15) year bus life expectancy. Some are underpowered. (0013, 0013-L –10)

Public Comment: To complicate this problem, our region has severe air quality problems and we are struggling to meet the requirements of the Clean Air Act. As you may know, today was another Code Orange day indicating poor air quality, one of 12 we've already had this year, in addition to four Code Red days, those days when air quality is at its worst. If we cannot reach our air quality goals, we run the risk of losing billions of Federal transportation dollars while allowing the increased health risks of breathing polluted air. (0142, 0142-T –3)

> ***Response:*** *The Dulles Corridor Rapid Transit Project is expected to improve the air quality in the National Capital area due to the diversion of passenger vehicles to transit. As illustrated in*

Section 4.6 of the Final EIS, improvements in CO concentrations over existing conditions are predicted at intersections throughout the Project area under the two Build Alternatives.

Metrorail Extension Will Help Reduce Use of Motor Fuel

Public Comment: With the Dulles MetroRail estimated to carry 290 million annual passenger-miles of travel, it would consume about 13 million gallons of motor fuel per year to move these people by automobile. Saving at least 13 millions gallons of motor fuel per year may be worth $18 million per year in addition to the clean air benefits. (0013, 0013-L –36)

Response: *Thank you for your input.*

Questions on Consideration of Increased Density in Air Quality Analysis

Public Comment: Second, I have not had enough time to thoroughly analyze the information presented, but I do have reservations about three of the factors impacting the air quality. First, it was not clear to me that the study took into account the significant increase in the number of people who will be working and residing in the areas around the stations as a result of the increases in FAR within a mile of the stations. (0203, 0203-L –2)

Public Comment: Second, with the new FAR increase, it is not clear to me that the models take into account the canyoning effect of the higher buildings. This will tend to keep the exhausts from all those cars in the area longer and at higher concentrations. (0203, 0203-L –4)

Response: *The air quality analysis is based on traffic volumes and growth projections developed by the Metropolitan Washington Council of Governments (MWCOG) and the Counties of Fairfax and Loudoun. These projections include anticipated land-use and density changes as discussed in Section 3.1 of the Final EIS.*

As described in Section 4.6. of the Final EIS, the air quality analysis was conducted using EPA's CAL3QHC Version 2.0 dispersion modeling program. The effects of taller buildings on CO concentrations near intersections (canyoning effect) are negligible. CO concentrations may even decrease due to higher wind speeds between buildings. The canyon effect is typically only applicable in dense metropolitan areas where buildings are over 400 feet tall.

Air Quality Analysis Should Reflect EPA's Decisions on Emissions in the Mid-West

Public Comment: While increases in fuel efficiency and reduced emissions play a significant part in maintaining the air quality in Reston and other areas over the next 20 to 50 years, given the EPA's recent move to reduce the required reductions for petrochemical and power plant emissions in the mid-West need to be factored into any model and certainly indicates to me that we cannot count on the reductions in automobile exhausts to actually take place. (0203, 0203-L –5)

Response*: Potential changes to the current federal emissions regulations for petrochemical facilities and power plants are not included in the Final EIS modeling analysis and are outside the scope of this Project. These effects may be reflected in future revisions to the SIP as mandated by the EPA. Regardless of these potential effects, emission rates from motor vehicles will continue to decline over time due to the requirements of the Federal Motor Vehicles Emission Control Program as mandated under the Clean Air Act. Newer cleaner-burning vehicles will replace the automobile fleet over time.*

EIS Should Address Cumulative Impacts of Increased Traffic on Noise and Air Quality

Public Comment: Cumulative impacts resulting from increased vehicular traffic on noise and air quality need to be assessed. (0150, 0150-T –12)

Public Comment: The effect of increased vehicular traffic on noise and air quality has not been sufficiently addressed and there is a lack of planning for adequate parking facilities, particularly within Tysons, where only a 2000-space facility is planned at Tysons West. (0150, 0150-T –6)

> ***Response:*** *As described in Section 4.7 of the Final EIS, the Virginia Department of Transportation "State Noise Abatement Policy" (January 1997) established evaluation criteria for vehicular traffic. The VDOT noise criteria, which utilize the FHWA Noise Abatement Criteria (NAC), were used to evaluate Project impacts using the peak hour cumulative noise level (or Leq) for those residences located adjacent to the proposed realignment of the Dulles Connector Road, DIAAH, and Dulles Toll Road.*
>
> *The cumulative impacts on air quality as a result of vehicular traffic were evaluated as part of the region's Financially Constrained Long Range Plan and in Chapter 9 of the Final EIS. As stated in Section 4.6 of the Final EIS, the Dulles Corridor Rapid Transit Project is included in the Financially Constrained Long Range Plan, which conforms to the federally approved SIP. Therefore, the Dulles Corridor Rapid Transit Project is assumed to conform to the SIP by reducing cumulative emission levels within the region.*
>
> *Park-and-ride capacity at each station/stop was designed and sized based on projected demand for spaces, site constraints, cost, and projected funding availability. Consultation with local governments was also an integral part of the sizing of park-and-ride facilities. The park-and-ride capacity identified in the Final EIS (see Table 6.3-3) and supporting documents such as General Plans – Facilities reflect this analysis and design process.*

Give More Consideration of Positive Air Quality Effects of Density Bonuses

Public Comment: Considering Northern Virginia has already stated that it will not be able to comply with the Clean Air Act by the deadline, the density bonus that would be given would have a greater impact than has adequately been considered. (0159, 0159-T –3)

> ***Response:*** *An evaluation of the cumulative effects of the transit alternative and secondary development due to the density bonuses is included in Chapter 9 of the Final EIS. Increasing the densities at the transit station areas results in much higher non-Single Occupancy Vehicle (SOV) splits in traffic and a much greater increase in walk and bike trips to the transit stations. The increase in SOV trips and in pedestrian and bicycle trips to transit stations, attributable to the density bonus, would have a positive impact on air quality.*

Air Quality Analysis is Not Adequate

Public Comment: I think also your air quality section is lacking and remiss. I have two examples. In your ozone, where you talk about ozone on page 4-89, you use the hour standard, and I understand that your data is only good through 2000 in the draft EIS, but there is 2001 data and there is some 2002 data, and I would recommend that you update your data in the study. (0258, 0258-T –4)

> ***Response:*** *With respect to the 1-hour standard, the NAAQS for ozone have been subject to continuing judicial challenges. In 1997, EPA promulgated new NAAQS for ozone, based on a new 8-hour average standard intended to replace the 1-hour average standard. On May 14, 1999, the U.S. Court of Appeals for the District of Columbia Circuit invalidated portions of the rules establishing the 8-hour ozone standard. In the July 20, 2000 Federal Register, EPA reinstated the 1-hour ozone standard in counties where the standard was previously revoked. This action returned the affected areas of Virginia, including the Project corridor, to the Serious ozone non-attainment designation that was in place when the 1-hour standard was revoked. In February 2001, the Supreme Court overruled the Circuit Court's decision on a number of grounds and remanded the case back to the Circuit Court for further proceedings. In the interim, the 8-hour ozone standard has not been vacated but also is not being implemented. EPA has not designated areas in attainment or non-attainment of the 8-hour ozone standard. Accordingly, the*

1-hour standard was the only applicable NAAQS for ozone at the time that the air quality analysis was performed.

With respect to the use of year 2000 data, the most recent ambient air quality measurements available at the time that the air quality analysis was performed were used. The most current data do not alter the results or conclusions of the air quality analysis.

Disagree with EIS that Regional Air Quality has Improved

Public Comments

Public Comment: But the statement that you make that says a number of violations of the ozone standard has been generally decreasing over time as a result of emission controls mandated by the Clean Air Act and the Virginia SIP, I would argue is not a true statement. It may be based on your three data points that you used, '98, '99, and 2000, but if you look at 2001 and look at 2002, I don't think that that data substantiates that statements. (0258, 0258-T –5)

Public Comment: Air Quality-- First of all, I would strongly suggest that the statement indicating the number of Code Red days was decreasing over the past several years be eliminated. We have already had more code red days this year than in any of the past ten years. (0387, 0387-L –15)

Response: *The decreasing trend in the number of violations of the ozone standard was based on the most recent data (1990-2000) that was available at the time the air quality analysis was performed. These data are available in the annual Virginia Ambient Air Monitoring Data Report from the VDEQ, Office of Air Quality Assessment, and online at http://www.deq.state.va.us/. The most current data do not alter the results or conclusions of the air quality analysis.*

Findings in a George Washington University Report on Regional Air Quality

Public Comment: Specifically I would refer you to a George Washington University recent publication that reported -- and here I'm going to talk about the eight-hour average standard rather than the one-hour, but in Ashburn, here in Ashburn, taken at Broad Run High School, the measurements from '98 to 2002, although, yes, from '98 to 2000, they show a declining number of eight-hour exceedance hours, when you look at 2001, it's the number of nine. '98 was 15, '99 was 7, 2000 was 1. But 2001 was 9, and already for 2002, we have had 9 occasions to exceed the eight-hour standard. We're not even through the summer yet. The forecast is this might be the worst year yet. I would argue that your ozone statement in here is not quite accurate. (0258, 0258-T –6)

Response: *With respect to the use of year 2000 data, the Draft EIS used the most recent ambient air quality measurements available at the time that the air quality analysis was performed. The statement that the number of violations of the ozone standard has been generally decreasing over time was based on 1990-2000 data for the number of days on which the primary standard of 0.112 parts per million was exceeded at any VDEQ monitoring station in the Northern Virginia Ozone Non-attainment Area. Therefore, it is possible that 8-hour data for 2001-2002 from the single site, such as the Ashburn monitoring station, might show a different trend from the 1999-2000 regionwide data discussed in the Draft EIS.*

The decreasing trend in the number of violations of the ozone standard was based on the most recent data (1990-2000) that was available at the time the air quality analysis was performed. These data are available in the annual Virginia Ambient Air Monitoring Data Report from the VDEQ, Office of Air Quality Assessment and online at http://www.deq.state.va.us/. The most current data do not alter the results or conclusions of the air quality analysis.

Review Analysis of Effects on Carbon Monoxide

Public Comment: And then moving to the carbon monoxide. I had hoped to be able to see in the draft EIS some quantitative data that shows that air quality is improved as a result of building metro or bus rapid transit to Dulles, and I was disappointed to find what I think is data that doesn't give full credit for the air quality -- I won't say improvements, because I kind of suspect our air quality is going to stay the way it is. I think hopefully we can keep it as good as it now. But if you look at the base line alternative, if you look at page 4-93, Table 4.6-5, the base line alternative is to build nothing, and you in your table show that carbon monoxide improves in 2006, 2010 and 2025. And I am told that the reason for that is the assumptions you have used in your model, that you assume that there will be compliance as is regulated, and I would argue that that's not a realistic assumption. I would argue that you need to go back and look at your assumptions. (0258, 0258-T –7)

> ***Response:*** *CO concentrations with the No-Build Alternative decrease from 2000 to 2025 because emission rates from motor vehicles will continue to decline over time due to the requirements of the Federal Motor Vehicles Emission Control Program mandated under the Clean Air Act. Additional decreases in emission rates are projected due to the Virginia Inspection and Maintenance (I&M) Program. For the Draft EIS air quality analysis, the assumptions regarding compliance with these programs were taken from* the *State Implementation Plan Revision, Phase II Attainment Plan, for the Washington DC-MD-VA Non-Attainment Area, Appendix G: Mobile Emissions Factors and Mobile Emissions Inventory Projections (MWCOG, February 2000). The VDEQ and the U.S. Environmental Protection Agency (EPA) have approved this document.*

Comment on Methodology for Air Quality Analysis

Public Comment: I would argue that your using regulations as the assumption in your models causes you to understate what you will gain if you were allowed to do some sensitivity analysis that would put in some better data. I do not think that not building anything we will see carbon monoxide improve the rate that it shows in the table on the page. And then if you take the base line alternative of carbon monoxide and how it improves by doing nothing, in terms of build, and compare that to the metro alternative on the table 4.6-9, it appears that the quantity of improvement is very, very slim, and therefore, I think that the draft EIS is subject to, and I've seen some data that says, most of the air quality improvement is not due to mass transit, but is due to technological advances over the next 25 years. I would argue that if you look at the data for the past five years in terms of air quality carbon monoxide that no one can say that with any amount of assurance or with any accuracy that using the regulations and the standards as your assumption is a reasonable thing to do. (0258, 0258-T –8)

> ***Response:*** *As the commenter suggests, fleet-wide technological advances in emission controls generally have a greater effect in reducing regional CO concentrations than could any one mass transit project. For the Draft EIS air quality analysis, the assumptions regarding technological advances and regulatory compliance were taken from the State Implementation Plan Revision, Phase II Attainment Plan, for the Washington DC-MD-VA Non-attainment Area, Appendix G: Mobile Emissions Factors and Mobile Emissions Inventory Projections (MWCOG, February 2000). This document has been approved by the VDEQ and the U.S. EPA. Notwithstanding the assumptions made about technological advances and regulatory compliance, the purpose of the Draft EIS and Final EIS has been to report the specific impacts of the Dulles Corridor Rapid Transit Project. The impacts of the project would occur regardless of background trends in technology or compliance rates.*

Do Not Constrain Air Quality Analysis to Federal Regulations

Public Comment: I think if you look at the last five or however many years you want to look at, pick out several data points and project them forward based on the population and the amount of transit increase projected in your draft EIS and see what that comes out to. Don't constrain it by of course we're going to meet the laws and do the right thing, because I think the data will show that we are not headed to do that

currently. And I don't think that the technology -- I don't think we are seeing evidence that there will be technology that will make those things get better. Otherwise, in terms of air quality, your draft EIS, in my mind, doesn't give you enough credit for the air quality improvements, and I think you need to do some modeling outside the box. I think you need to not be constrained by assumptions that might not be realistic. (0258, 0258-T –9)

> ***Response:*** *The purpose of the Draft EIS and Final EIS has been to report the specific impacts of the Dulles Corridor Rapid Transit Project. The impacts of the Project will occur, and the Project alternatives can be compared, regardless of background trends in technological advances and regulatory compliance. The assumptions used in the Draft EIS and Final EIS air quality analysis regarding technology or compliance rates were taken from the State Implementation Plan Revision, Phase II Attainment Plan, for the Washington DC-MD-VA Non-attainment Area, Appendix G: Mobile Emissions Factors and Mobile Emissions Inventory Projections (MWCOG, February 2000). This document has been approved by the VDEQ and the U.S. EPA.*
>
> *Furthermore, if the assumptions about air quality regulations and emission control technology were altered from those in the Draft EIS and Final EIS, the magnitude of the predicted concentrations might vary, but the conclusions of the analysis with respect to the impacts of the Dulles Corridor Rapid Transit Project would remain the same.*

Assumption of Metrorail Extension in Regional State Implementation Plan

Public Comment: The use of the Metrorail as a basic assumption (though unfunded) in the Regional Air quality (AQ) State Implementation Plan (SIP) essentially makes the argument for rail to Dulles. If the decision were made to not do one of the alternatives in this EIS, the region would have to re-run the AQ models to determine if we will remain in compliance with the National Ambient Air Quality Standards (NAAQS) especially for ozone for which we are not in non-compliance. It is highly unlikely that we could meet the NAAQS and this would have disastrous consequences: 1) it will shut off any new Federal Highway funds and 2) it would require the addition of new lanes of traffic where no additional lanes are possible without tremendous dislocations of land uses along the corridor. (0287, 0287-T –2)

> ***Response:*** *The regional air quality conformity analysis and the State Implementation Plan Revision, Phase II Attainment Plan, for the Washington DC-MD-VA Non-Attainment Area include Metrorail as one of the anticipated alternatives for implementation of the Dulles Corridor Rapid Transit Project. The commenter suggests that if none of the Draft EIS alternatives were implemented, the region would not be able to demonstrate attainment of the NAAQS for ozone. In that event, the VDEQ and the MWCOG would be required to implement additional emission controls in order to demonstrate attainment. However, based on the proportion of the Dulles Corridor Rapid Transit Project to all the other projects included in the Plan, it is highly unlikely that the Plan's conformity status depends on the Dulles Corridor Rapid Transit Project alone to maintain conformity.*

Concern About Assumption of Rail Fleet Turnover

Public Comment: The assumptions of ridership using metro or one of the other options is an important element of the Metropolitan SIP but the other assumption made in this EIS which is that fleet turnover (newer cars with tighter emissions standards taking the place of older ones having lower exhaust and engine emissions) which over the next 30 years will keep us in compliance with the NAAQS is while technically possible a chancy bet. Metrorail will reduce emissions by hundreds of tons because it keeps autos out of the peak hour of traffic and provides relief from the necessity of creating additional transportation lanes. (0287, 0287-T –3)

> ***Response:*** *The purpose of the Draft EIS and Final EIS has been to report the specific impacts of the Dulles Corridor Rapid Transit Project. The assumption made in the Draft EIS about fleet turnover is the same assumption as was made in the State Implementation Plan Revision, Phase II Attainment Plan, for the Washington DC-MD-VA Non-Attainment Area, Appendix G: Mobile*

Emissions Factors and Mobile Emissions Inventory Projections (MWCOG, February 2000). The benefits of Metrorail in reducing emissions would occur regardless of the assumption made about fleet turnover.

Metrorail Has Better Air Quality Effects than More Highway Lanes

Public Comment: Adding highway lanes as opposed to the Metrorail option will exacerbate AQ concerns and our ability to remain in attainment for the NAAQS. If we are out of attainment for the NAAQS we will lose new Federal highway funds. (0287, 0287-T –4)

Response: *The commenter correctly states that one of the potential consequences of inability to remain in attainment of the NAAQS for ozone is a loss of federal highway funds. More specifically, a failure to maintain conformity of the Financially Constrained Long Range Plan (National Capital Region Transportation Planning Board, MWCOG, Washington, DC) with the SIP could lead to a cutoff of federal highway funds. The regional air quality conformity analysis for the Financially Constrained Long Range Plan includes Metrorail as the anticipated alternative for implementation of the Dulles Corridor Rapid Transit Project. In the event of a failure to maintain conformity with the SIP, the VDEQ and the MWCOG would be required to implement additional emission controls in order to demonstrate attainment and ensure restoration of federal highway funds.*

Suggestions for Alternative Scenarios to Air Quality Analysis

Public Comment: Since the EPA requirements which form the basis for improved air quality in the corridor are a) subject to change, b) subject to revocation, or c) may not be attainable, the final EIS should consider three scenarios for air quality. The first would be no change for the current emissions rates; the second would be some intermediary reduction; and the third would be the level of reduction forecast in the draft EIS. (0203, 0384-L –2)

Response: *The scenarios proposed by the reviewer involve potential trends in emission rates that would occur with or without the Dulles Corridor Rapid Transit Project (i.e., they would be included in the No-Build Alternative and all Build Alternatives). However, the purpose of the Draft EIS and Final EIS has been to disclose and compare the impacts of the project alternatives. The impacts of the project would occur regardless of trends in emission rates. Therefore, the analysis proposed by the reviewer is not necessary for purposes of the Draft or Final EIS.*

Explain How CO Relates to Ozone Concentrations

Public Comment: The DEIS doesn't make clear why one needs to model CO concentrations when the only non-attainment pollutant is ozone. An apparent "statement of fact" as presented in the first sentence of the second paragraph of Section 4.6.1.4 in the DEIS is insufficient. Instead, why not just include all of Section 3.8 (Pollutants of Concern) from the Air Quality Technical Report. Providing this explanation of how CO relates to ozone concentrations would make it perfectly clear to the readers of the report -- and especially the project's critics. (0387, 0387-L –16)

Response: *The NAAQS were established using criteria based on protection of human health. The NAAQS specify a different concentration standard for each pollutant, and the NAAQS for CO are relatively stringent. Emissions rates from vehicles are also different for each pollutant, and the pollutant emitted in greatest quantities from vehicles is CO. As a result, under adverse air quality conditions, the CO standard would be the first NAAQS to be exceeded due to local traffic impacts. If the CO standard is not exceeded, then the ambient concentrations of the other pollutants that have localized impacts also should be less than the NAAQS. Therefore, CO is used as the indicator pollutant in evaluating air quality impacts from vehicles.*

CO concentrations tend to be highest in localized areas because they are most affected by local traffic congestion. By comparison, motor vehicles do not emit ozone. Rather, cars and trucks are

responsible for precursor pollutants (primarily volatile organic compounds and nitrogen oxides), which react in the presence of sunlight to form ozone in the atmosphere. These reactions occur over periods of hours and days, while the pollutants are diluted and transported downwind. Consequently, ozone is considered a regional pollutant.

The effects to air quality from all planned transportation improvements are evaluated as part of the region's Financially Constrained Long Range Plan. The Dulles Corridor Rapid Transit Project is included in this plan, which conforms to the federally approved State Implementation Plan (SIP). The air quality analysis was performed in accordance with EPA guidance (U.S. Environmental Protection Agency, Office of Air Quality Planning and Standards). Guideline for Modeling Carbon Monoxide From Roadway Intersections (EPA-454/R-92-005, November 1992.)

Provide More Information on Impact of Preferred Alternative on Regional Air Quality

Public Comment: Further refine the impact the preferred alternative will have on metropolitan Washington's air quality. The public deserves more definitive information on addressing these two critical issues. (0396, 0396-L –7)

Response: *The air quality analysis was performed in accordance with National Environmental Policy Act (NEPA) requirements to evaluate and disclose the impacts of the Dulles Corridor Rapid Transit Project. The air quality analysis followed the guidance of EPA, VDEQ, and MWCOG.*

Draft EIS Should Evaluate the Potential Negative Impact of Increased Density

Public Comment: Tables 9.3-3 and 9.3-5 state that no exceedance of the NAAQS are anticipated. But exceedance is not the appropriate way to assess whether or not an impact is adverse. Instead, the Draft EIS would quantify and evaluate the extent to which the increased density would contribute to a deterioration in air quality. (0510, 4-05)

Response: *Air quality analysis was conducted in accordance with all standard procedures and followed the guidance of EPA, VDEQ, and MWCOG. Since the Project was determined to meet be in conformance with the federally approved SIP, and since no exceedance of NAAQS are anticipated, no secondary or cumulative effects would occur.*

Analyze the Impacts of Generating Electric Power for the Metrorail Extension

Public Comment: The use of Metrorail must include an analysis for the pollution impacts on the Washington metropolitan region resulting from the generation of the electrical power for the system. (0487 4-02)

Response: *Power-generation facilities were not evaluated. Electricity for public transportation operations would be purchased from existing sources. Analyzing power-generation methods is beyond the scope of this study.*

Need to Improve Regional Air Quality

Public Comment: We face a future that will include many new residents and jobs. Over the next 25 years the Greater Washington region will add 1.4 million people (+32%) and 1.1 million jobs (+39%). In the Dulles Corridor alone, this increase will amount to an additional 206,000 people (+56%) and 203,000 jobs (+71%) - a rate of growth nearly twice the rate of the region as a whole. For purposes of perspective, this rate of growth will be equivalent to the corridor accommodating the populations of Arlington and the City of Fairfax and approximately the number of workers who are currently employed in Loudoun, Prince William and Manassas. At the same time, the Council of governments also forecasts that vehicle miles traveled (VMT) in our region will increase by 46% by 2025, while freeway and arterial lane miles are forecast to increase by only 13 percent - a recipe for further gridlock compounding our current ranking as the nation's third most congested region. To complicate this problem, our region has severe air quality

problems, and we are struggling to meet the requirements of the Clean Air Act. As you may know, today was a "code orange" day, indicating poor air quality - one of 12 this year already. In addition, we have already had four "code red" days - those days when air quality is at its worst. If we cannot reach our air quality goals we run the risk of losing billions of federal transportation dollars, while allowing the increased health risks of breathing polluted air. (0142, 0219-M –1)

> ***Response:*** *As outlined in detail in Chapter 1 of the Final EIS, the purpose of the Dulles Corridor Rapid Transit Project is to provide transit system enhancements that would provide a direct connection to the existing Metrorail system. These enhancements would offer an alternative means of travel for the growing number of residents, employees, and visitors in the Dulles Corridor as well as a high quality transit link to the Metrorail system in order to improve mobility throughout the region. These proposed improvements would help to address the issues raised in the comment, namely improving transportation service, providing an alternative mode of travel to that of the automobile, increasing transit ridership, and supporting current and future population growth and development in the Dulles Corridor and region.*

B. Supplemental Draft EIS Comments

Federal Agency Comments

Control of Emission

Federal Comment: DEQ's Air Division reiterates its earlier guidance relative to open burning and fugitive dust emissions. The Division also continues to recommend restricting emissions of volatile organic compounds and oxides of nitrogen because the project will take place in an ozone non-attainment area and an emissions control area for volatile organic compounds and oxides of nitrogen, the precursors to atmospheric ozone. (0080 0094-1)

> ***Response:*** *The air quality analysis conducted for the Dulles Corridor Rapid Transit Project was developed in accordance with EPA and Federal Transit Administration (FTA) requirements for NEPA evaluations. All air quality effects associated with the construction and long-term operation of the Dulles Corridor Rapid Transit Project are discussed in the Section 4.6 of the Final EIS.*

Public Comments

Control of Emission

Public Comment: g. The claim (e.g. at TABLE 2-2) that Phase 1 will “improve vehicular emissions” needs to be supported with detailed data, based on an objective study meeting industry standards that takes account of likely use patterns (e.g., congestion resulting in the rush to/from stations, as well as revised traffic patterns resulting from avoidance of increased tolls by motorists that will increase, not decrease vehicular emissions along arterial routes and in neighborhoods radiating out from the Dulles Toll Road corridor both to the north, south, east and west). (0068 0173-24)

> ***Response:*** *Although improvements in regional air quality are anticipated in conjunction with the development of the Dulles Corridor Rapid Transit Project, it is true that most improvements are attributable to the reduction of high emission vehicles over time as mandated by EPA regulations. The Dulles Corridor Rapid Transit Project would help support regional air quality goals by providing an alternative mode of transportation to single occupant automobiles and additional transit capacity within the region.*

Impacts on Air Quality

Public Comment: Many parties claim that Dulles Rail will enhance air quality. Our research indicates that air quality would be the same regardless of whether Dulles Rail is built or alternate methods are employed. I believe this conclusion falls from the table shown in the DEIS but if this conclusion is not

correct please explain. (0061 0069-6)
Public Comment: Statements that Dulles Rail improves air quality attainment are not supported by fact. (0016 0122-14)

Public Comment: The claim has been made that Dulles Rail will enhance air quality. Our research indicates that air quality will be the same regardless of whether Dulles Rail is built or alternate transit methods are employed. If you disagree with this conclusion, please provide evidence. Figure in your calculations extra emissions to generate the electricity to keep Dulles Rail running and its impact on NOx. (0061 0117-8)

Public Comment: Parties claim the Dulles Rail will enhance air quality. We don't think that that's indicated or in the DEIS, and we dispute that conclusion. (0061 0136-5)

> ***Response:*** *Although improvements in regional air quality are anticipated in conjunction with the development of the Dulles Corridor Rapid Transit Project, most improvements are attributable to the reduction of high emission vehicles over time as mandated by EPA regulations. The Dulles Corridor Rapid Transit Project would help support regional air quality goals by providing an alternative mode of transportation to single occupant automobiles and additional transit capacity within the region.*

Public Comment: Please explain how it is possible for both the DEIS and the SDEIS to ignore the emissions associated with operating Metrorail. These emissions are among the most significant environmental impacts of the project. (0063 0151-12)

Public Comment: l. The SDEIS needs to evaluate Air Quality (e.g., TABLE 2-2) with data and discussion that accounts for the years of MetroRail-related construction, gridlock emissions and delay that would continue to make this “Severe Non-Compliance” area for Clean Air Act NAAQS parameters suffer. This blinders approach is particularly evident in the SDEIS contention that no NAAQS violations will occur – an indefensible assertion given the fact that at the earliest, 2009 would be the beginning of operation of mass transit in an area of severe non-compliance. (0068 0173-29)

> ***Response:*** *The air quality analysis conducted for the Dulles Corridor Rapid Transit Project was developed in accordance with EPA and FTA requirements for NEPA evaluations. Air quality effects associated with the construction and long-term operation of the Dulles Corridor Rapid Transit Project are discussed in Section 4.6 of the Final EIS.*

Air Quality Related to Power Consumption

Public Comment: The SDEIS states that the project is necessary to help meet national air quality standards. Yet, the SDEIS does not consider that Metrorail is a massive consumer of electricity, that much of this electricity is generated by coal-fired power plants, and that the regional Council of Governments has determined that pollution from coal-fired power plants is one of the leading causes of our region's air quality problems. (0063 0151-10)

Public Comment: In 2001, Metrorail consumed well over 400 million kWh of electricity – enough to power a small city. Much of this electricity was generated by coal-fired power plants. Some of these plants are within our region and have a direct impact on air quality. Other plants are outside of our region, but their emissions are transported here by prevailing winds. Metrorail actually is a significant polluter, responsible for large level of NOx, particulate matter, carbon dioxide, SO2, mercury, and other compounds. In some cases, Metrorail actually emits more pollution, on a per passenger mile basis, than a typical passenger automobile. (0063 0151-11)

> ***Response:*** *The emissions that result from the demand for Metrorail are not described in the Draft EIS nor in the Supplemental Draft EIS due to the conformity process required by the Clean Air Act and the requirements to account for mobile and stationary source emissions. Power plant*

emissions due to all existing and future projected demands, including those for the Metrorail extension, are accounted for as part of the statewide emissions inventory and included in the SIP.

In addition, all power plants must submit to a strict permitting process by demonstrating compliance with all applicable emission limits and ambient air quality standards established by the U.S. EPA and the VADEQ. Therefore, power plant emissions caused by power demand to operate Metrorail, or the rest of the region's electrical grid, are documented and regulated by the federal and state conformity process. Emissions from all power plants located in the MWCOG region are accounted for in the SIP prepared by the MWCOG. Emissions from the Mount Storm facility in West Virginia would not be included MWCOG's SIP, but rather the West Virginia SIP.

4.7 Noise

A. Draft EIS Comments

State Agency Comments

Noise Analysis Should Consider VDOT, MWAA and FTA Criteria

State Comment: VDOT's noise criteria were judged not to apply because "no other roadway changes affecting either capacity or elevation are expected…" This is a narrow and not totally accurate viewpoint since both VDOT traffic projections and expectation for increased vehicle usage stemming from density allowances, will substantially increase traffic in the Dulles Connector section that adjoins our community. The EIS references plans to widen the connector, giving further indication of the prospect of increased vehicular traffic. The EIS should broaden its noise abatement scope to include both MWAA and VDOT policy as well as that of the FTA. (0012, 0468-L –5)

Response: *Except where noted, no other changes to the existing roadways are proposed as part of the Dulles Corridor Rapid Transit Project. Any other roadway changes are part of other projects sponsored by either the VDOT or the Metropolitan Washing Airport Authority (MWAA), and these projects are independent of the Dulles Corridor Rapid Transit Project.*

EIS Should Consider Local Ordinances on Any Transportation-Related Noise

State Comment: The EIS further references local ordinances on noise, but again narrowly excludes transit operations. The Policy Plan for the Comprehensive Plan of Fairfax County has as its objective (number 5): "Minimize human exposure to unhealthful levels of transportation generated noise." It makes no distinction between vehicular and transit generated noise. In fact the local ordinance regulates new development, to ensure that people are protected from "transportation noise," and that noise impacts inn areas of existing development should be reduced. The EIS needs to address noise mitigation in this light. (0012, 0468-L –6) (0137, 0304-L-2)

Response: *As described in Section 4.7 of the Final EIS, the Fairfax County noise ordinance (Code of the County of Fairfax, Chapter 108, January 1, 1976) of 55 dBA at residential receptors and 60 dBA at commercial receptors applies only to stationary sources and facilities. The Fairfax County noise criteria were used to evaluate noise impacts from Project-related stationary facilities such as passenger stations, park-and-ride facilities, and Metrorail yards. Proposed noise mitigation locations are listed in Table 4.7-6 of the Final EIS.*

Several Office, Restaurant and Retail Land Uses Incorrectly Classified as FTA Land Use Category 3 Sites

State Comment: Noise and Vibration Technical Report (June 2002)

§ Table 3-13 - Several office, restaurant and retail establishments are incorrectly classified as FTA Land Use Category 3 sites. These and similar commercial and industrial properties are not considered noise-sensitive according to FTA.
§ The term "Baseline Alternative" as used throughout the report should be more appropriately termed the "No-Build Alternative." While FTA does not specifically require a noise assessment for the future No-Build Alternative, it is appropriate to provide such an assessment where significant changes in the noise environment are anticipated due to factors unrelated to the project. Typically, the No-Build conditions are similar to the existing conditions such that no assessment is needed. However, the No-Build case needs to be addressed in the EIS and thus it is of interest to know if impacts are expected without the project. Such information can be useful in determining if mitigation for the build alternatives is reasonable and feasible. (0421, 0421-A –11)

Response: *Although offices and conference rooms may be categorized as Category 3 land uses, restaurants and retail establishments are not considered noise-sensitive institutional receptors according to the FTA guideline* (Transit Noise and Vibration Impact Assessment, 1995). *) These discrete receptors were selected, however, as representative of the types of commercial land-uses identified along the Dulles Corridor in Tysons Corner, and their inclusion makes the environmental study more informative. Although project noise levels were reported at these discrete receptors, a noise impact assessment using the FTA criteria was not evaluated at these locations.*

Additionally, project mitigation measures are determined to be reasonable and feasible based on their noise reduction potential, their effects on transit service, capital and operating costs, and their social and visual impact, as well as other potential environmental factors.

The Baseline Alternative of the Draft EIS is the No-Build Alternative of the Final EIS. FTA noise analysis guidelines do not require an analysis of future No-Build noise conditions. FTA guidelines require only analysis of Project-induced noise levels relative to existing ambient conditions.

Noise Mitigation for the Hallcrest Heights Community

State Comment: I concur with Mr. Tyler's request that Hallcrest Heights should receive the same level of noise attention measures as nearby communities adjacent to the Dulles Airport Access Road have already received. I also agree with his suggestion that noise attenuation measures to address the concerns of Hallcrest Heights and the Westhampton area citizens should be initiated before the construction of transit operations facilities. (0012, 0468-L –4)

State Comment: Insufficient attention is being paid to mitigating the impact of rail on adjoining communities. Communities that are already suffering from inadequate abatement of noise from the Toll Road must be guaranteed that they will finally receive sufficient mitigation measures. Of particular concern is Hallcrest Heights in McLean, which has had only a deteriorating, dilapidated wooden barrier to stop the noise. Given that the proposal is for an elevated, curving rail structure to adjoin the community, they urgently need attention. However, noise is a serious concern for communities along the entire length of the proposed rail system and must be addressed responsibly. (0298, 0298-L –4)

Response: *The Project Team utilized the guidelines established by the FTA in its Transit Noise and Vibration Impact Assessment* (1995) *to determine the applicable noise impact criteria in all areas of the proposed corridor. The FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas, such as Hallcrest Heights, with higher background levels, Project noise limits established by the FTA are*

more stringent than in quieter areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.

There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near the Ronald Regan Washington National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Four- or six-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The types and location of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed parapet barriers closest to Hillcrest Heights.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria, including effectiveness and cost, are typically used to make decisions on sound barrier location, height, and type. Generally speaking, roadside sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Potential Noise Impacts to Route 123 Area

Public Comment: The Project Team needs to explain how communities near Route 123/Dulles Toll Road would be protected from visual, noise, squeal, and vibration impacts. (0392, 4-01)

Response: *Proposed mitigation measures are identified in Chapters 2, 3 and 4 of the Final EIS..*

Public Comment: The new station will bring unwanted noise to the Rotonda. (0496 01)

Response: *This comment concerned the potential effects of Alignment T4, which was eliminated from further consideration after the public and agency review and comment on the Draft EIS.*

Potential Noise Impacts of Elevated Metrorail Track Sections

State Comment: There is one matter that upon consideration of the likely project description in the vicinity of your community I believe should be addressed by WMATA as they perform their noise assessment: Where the Metrorail right-of-way rises above grade adjacent to your development, the vertical retaining walls and elevated structure will create sound-reflecting surfaces parallel to the existing highway noise barrier. Reflections from the railway structures may degrade the barrier performance in the manner of "parallel barriers." The significance of this should be examined and mitigation incorporated if necessary. Mitigation can be accomplished by various means, the simplest of which is absorptive treatment of the vertical surfaces. (0012, 0012-A –2)

Response: *The Final EIS identifies mitigation in the form of parapet barriers for impacts at receptors adjacent to aerial guideway sections of the Metrorail Extension (see Section 4.7). The potential for noise reflections was not assessed as part of the Draft or Final EIS. As the*

commenter suggests, acoustically absorptive treatment is an excellent method for eliminating barrier degradation due to the "parallel barrier" effect. Absorptive treatment of the retaining walls leading to the aerial track structure will be investigated further during preliminary engineering and final design.

Local Agency Comments

Fairfax County Board of Supervisors Request for Written Response on Concerns Over Noise and Traffic Impacts

Local Comment: At its meeting of July 22, 2002, the Fairfax County Board of Supervisors expressed several concerns about noise and traffic impacts of the Dulles Corridor Rapid Transit Project documented in the Draft Environmental Impact Statement. The Board requested a written response addressing these concerns and plans for appropriate mitigation efforts. Three specific concerns were identified and these are noted below:

1) The first concern is about the impact of 26 additional rail cars at the WMATA Service and Inspection Yard at the West Falls Church Metrorail Station on homes in the Lemon Road community. Rail cars entering and leaving the yard at late night and early morning hours are a source of increased noise, loud horns and squealing brakes. The Project Team has identified this impact, but has not specifically proposed any mitigation strategies. (0121, 0121-A –1)

Local Comment: The public hearing report should include a response to the concerns of the Fairfax County Board of Supervisors regarding noise and traffic impacts conveyed in Chairman Hanley's August 2, 2002 letter to you (copy attached). (0479, 0479-L –8)

Response: *With respect to the concerns of communities on the noise of the Metrorail West Falls Church Yard, the Project Team recommended and the decision-makers approved the enclosure of 1) a portion of the existing loop track at the yard's eastern end and 2) the new yard lead in box structures. These noise mitigation measures by the Project will reduce the wheel squeal noise of the train movements within the Yard. The Project Team notes, however, that new residences have been recently constructed and occupied adjacent to the West Falls Church S&I Yard without any noise mitigation provided by the residential developer. As during the past ten-year effort to address yard noise, there will be coordination among DRPT, WMATA, Fairfax County officials and staff, and representatives of the communities during preliminary engineering and final design.*

The number of additional cars at West Falls Church Yard has increased from 26 in the Draft EIS to 42 in the Supplemental Draft EIS and Final EIS in order to support the Metrorail fleet of the Wiehle Avenue Extension. Wheel squeal from the new yard lead (for Metrorail trains to and from the Dulles Corridor Line) at the east end of the yard was included in the modeling analysis. Based on measured noise levels from the current wheel squeal along a similar radius curve at the yard, exceedances of the FTA impact criteria are predicted at nearby residences. No exceedances are predicted from the Project's aerial guideway in the median of the Dulles Connector Road.

Other sources, such as horns, were not included in the modeling analysis. Brake squeal was not determined to be a major problem. Based on the current operating schedule at the yard, the increase in the overall yard noise due to the cleaning and general operation of 42 additional Metrorail cars needed for the Project is expected to be minimal.

Proposed Parapet Wall Inadequate to Mitigate Noise on Hallcrest Heights

Local Comment: The current noise abatement recommendations for properties near Hallcrest Heights include a three-foot tall parapet along the aerial rail sections next to residential areas. It is clear that this may be insufficient to reduce the noise generated by the meeting of rails and wheels on a curve. (0121, 0121-A –2) (0479, 0479-L –11)

> ***Response:*** *There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. To better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near the Ronald Regan Washington National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.*

Respond to Concerns of Noise Impacts on Polo Fields, Westwood Village and Chathams Ford

Local Comment: Respond to neighborhood noise concerns by including noise walls or other mitigation for Polo Fields, Westwood Village and Chatham Fords communities. (0437, 0437-E –7)

> ***Response:*** *No exceedances of the FTA impact criteria are predicted in the Polo Fields or the Chathams Ford communities. As a result, no mitigation measures to reduce future transit noise levels are currently proposed along those areas of the Dulles Corridor. However, as a result of impacts predicted in the Westwood Village) community under the Build Alternatives, proposed mitigation measures will be investigated further during preliminary engineering and final design.*

Impacts from Proposed Park-and-Ride Structure at Tysons West Station

Local Comment: Significant noise and traffic impacts may be caused by the proposed 2000 car parking structure on Route 7 at Tysons Corner. The current proposals do not address the noise impact that could reasonably be expected from increased traffic. (0121, 0121-A –3) (0479, 0479-L –12)

> ***Response:*** *The park-and-ride structure at Tysons West Station has been reduced from 2,000 spaces to 500 spaces, thereby reducing the potential for noise impacts at this location. Noise levels from the park-and-ride facilities proposed along the Dulles Corridor, including the Tysons West Station facility of 500 spaces, were included in the modeling analysis and discussed in the Final EIS using the FTA's General Assessment guidelines. The FTA modeling methodology was adjusted to account for a maximum throughput volume of 500 cars during the early morning peak-hours.*
>
> *Based on these maximum operating conditions (i.e., the facility is filled to capacity), the overall noise levels from the facility at the closest residences in Westwood Village are predicted to be negligible. The predicted day-night noise level from the park-and-ride facility of 40 dBA at a residence in Westwood Village is well below the measured background level of 54 dBA. As a result, no exceedances of the FTA impact criteria are predicted as a result of the proposed Tysons West park-and-ride facility. The current ambient noise at these receptors is generally dominated by traffic along the Dulles Toll Road/DIAAH. However, noise mitigation measures are proposed to eliminate impacts due to the proposed Metrorail operations along Route 7.*

Public Comments

DCRA Recommendation to Mitigate Noise Impacts at West Falls Church and Hallcrest Heights

Public Comment: On behalf of DCRA I offer the following additional comments: We support the concerns of the citizens of McLean who are concerned about increased noise from the rail yards at West Falls Church and the Hallcrest Heights residents whose homes lie below the rail line as it ascends and approaches Tysons Corner. We recommend that the project be engineered to mitigate noise impacts from the rail extension, as well as those from its construction. (0131, 0434-E –1)

> ***Response:*** *Where exceedances of the FTA, WMATA and other Project criteria are predicted, noise mitigation measures are proposed (see Section 4.7 of the Final EIS) and will be investigated further during preliminary engineering, as appropriate. Within the West Falls Church Yard, the Project will enclose of a portion of the loop track at the yard's eastern end and the new yard lead in box structures in order to reduce the wheel squeal of trains in the yard.*

Effects of Construction Noise on Hallcrest Heights Community

Public Comment: Although specifics are not given in the EIS, it is not hard to judge from precedents in other elevated sections of the Metro system, that construction noise will be considerable. Since our community [Hallcrest Heights] lies some 10-12 feet below the level of the roadway in the corridor, the construction of the elevated and curving section of the proposed rail service into Tysons, will involve substantial and sustained construction noise over an extended period of time. Given the FTA's policy of coordinated transportation planning (which I assume would include dealing with such public agencies as MWAA and VDOT), the EIS should sequence significant transportation noise mitigation measures in the corridor (and particularly our adjoining section) ahead of construction activities. Since VDOT has chosen not only to not maintain the existing ineffective barrier, (which is too low and too short anyway), and since MWAA has said they will not retrofit any communities for such abatement, the EIS should address the problem in a comprehensive way if the project's objective to protect adjoining communities has any meaning at all. If the EIS were to include such analysis, then a noise barrier of modern design equivalent to that erected for Wolf Trap and other communities in the corridor should be placed at our section of the corridor. Such a barrier must extend all the way down the off-ramp to the merge with Route 123 if it is to have any effect at all. (0137, 0304-L –3) (0012, 0468-L –7)

> ***Response:*** *Exceedances of the WMATA noise criteria for construction activities were identified in Section 4.7 of the Final EIS. Construction noise and potential mitigation will be further analyzed during preliminary engineering and final design.*
>
> *Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Four to six-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The types and location of the proposed mitigation measures are described in Section 4.7of the Final EIS. Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed parapet barriers closest to the Hallcrest Heights.*
>
> *Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.*

Install Concrete Walls Along Aerial guideway Sections

Public Comment: Install concrete walls along elevated sections of the track. They might be quite high in some areas, but I understand that they would be the most effective way to address both sound and visual pollution problems. (0432, 0432-E –6)

> ***Response:*** *Parapets (or track edge barriers) will be installed along all aerial (above-ground) sections of track and will shield new noise from Metrorail train passbys. These parapets will be three to four feet high, except in places exceedances of the FTA criteria are predicted, where the parapets will be five to six feet in height. As stated in the Final EIS, these mitigation measures will be refined during preliminary engineering and/or final design.*

Noise Impacts of West Falls Church Yard and its Improvements

Public Comment: My neighbors and I are living on McKay Street just behind the Metro Maintenance Yard near the West Falls Church Station. There are approximately 20 residential homes on McKay Street and another 10 houses on Eastman Drive. Some of us had the opportunity to attend the Public Hearing at Springhill Elementary School on July 29th. After the meeting we visited the Exhibit Room where we met with acoustical consultants. After studying the aerial maps of the area around our neighborhood and the new Dulles Corridor Rapid Transit Project, we had a lengthy discussion about noise in our neighborhood from the Metro trains and other equipment. We were told that a spur off the main Metro line from Dulles Airport will be constructed in back of our homes on the Dulles Access Highway side, which will connect with the Metro Maintenance Yard in back of us. We are currently living with high-pitched screaming train wheels, blowing horns, blaring loudspeakers, and other irritating noises from the Yard. Metro tried unsuccessfully for several years to mitigate the high decibel noise levels. We in the neighborhood are very concerned and bothered to think that Metro is planning another project into the yard that will only cerate additional bothersome, annoying, disruptive noise in our neighborhood, which frankly, WE DO NOT NEED. (0089, 0089-L –1)

Public Comment: I have been a homeowner and resident at the above address [McKay Street] since 1961, and experienced the problems of the Washington Metropolitan Area Transit Authority's maintenance yard to date. The attached copy of the Arlington Journal article of December 16, 1992 explains much of the problem for local residents. The noise factors (shrieking sounds, train horns, loud speaking, equipment, etc.) are still factors that degrade the quality of living in many ways, particularly during night hours! Last week I had two nights of broken sleep because of the noise. One night noise at about 2:30 AM and 3:30 AM. The other night 3:30 AM-4:00 AM. (0417, 0417-L –1)

Public Comment: We are particularly concerned about squeal at the West Falls Church maintenance yard and at the flyover at I-66, where the transit will take off for Dulles. (0145, 0145-T –8)

Public Comment: We are particularly concerned about squeal at the WFC maintenance yard and noise of all types at the planned flyover of I-66. (0145, 0452-E –5)

Public Comment: The EIS should address the impact on the Lemon Road community of increased use of the maintenance yard (and construction of a lead track) near the West Falls Church station. Similarly the EIS should be revised to address neighborhoods' concerns about the schedule and intensity of nighttime construction of the rail system, possibly by putting needed noise barriers in place before construction begins. (0392, 0392-L –20)

Public Comment: We already have a high level of ambient noise in our [Westhampton] neighborhood. We already listen to the noise that the Orange line trains make as they cross switches into the West Falls Church metro station, as trains are fed into Arlington from that station's rail yard during rush hour, and as they pass by to and from Vienna. We already hear "wheel squeal" at 2:00 AM as trains are moved around in the rail yard adjoining the station. We look out our back windows at the West Falls Church metro station. (0403, 0404- L- 1)

Public Comment: Increased noise volumes and frequency can be expected from the additional, longer trains on the new track; from the steel support as the track crosses I-66; from additional switches; and at the expanded WFC rail storage and maintenance yard. This noise may be exacerbated by a tunnel at the rail yard concentrating and directing noise at the Westhampton neighborhood. (0403, 0403-L-1)

Public Comment: There is already a lot of squealing noise due to train wheels rubbing against the rails in the tight turn of the West Falls Church yard. Additional trains in this yard will make the problem worse. The present problem needs to be addressed by Metro now and designs made to avoid the same problem with any new construction. (0029, 0040-CC-1)

Public Comment: We would like to see improved transportation service for the Dulles Corridor. I travel the Toll Road to work each day. However, there must be minimal impact on the established neighborhood around the West Falls Church station. McKay St. families have already experienced excessive noise from the present setup. (0267, 0267-L –1)

Public Comment: Noise must be a primary concern for any expansion or additional use of the West Falls Church Metro yard. (0065, 0065-CC-1)

Public Comment: Additional noise would be completely unacceptable and inhumane. Please reconsider your plan for above ground storage. The Dulles track encroaching on our yards, and all aspects creating more noise. (0065, 0065-CC-2)

Public Comment: Investigate noise level mitigation measures at the West Falls Church Rail Yard connector to eliminate wheel squeal noise at adjacent residents along McKay St. (0031, 0031-CC-1)

Public Comment: I raised the following concerns about effects around the existing West Falls Church S&I yard. The draft shows expected impact of noise on houses along McKay Street, but does not distinguish whether this will come from the new lead tracks on the north/northeast loop, or the mainline, or both. If it increases the currently unmitigated noise from that tight loop, will the extraordinary measures needed to control it be taken? The two different sources of noise will require two different types of control. Will the additional noise from additional storage tracks be controlled with additional measures? (0424, 0424-E –1)

Public Comment: Increased noise volume, frequency, and duration can be expected from the additional trains on the new track and at the WFC train storage and maintenance yard. This noise may be exacerbated by a tunnel at the train yard concentrating and directing noise at the Westhampton neighborhood. (0398, 0398-L –1) (0386, 0386-E –1) (0399, 0399-L –1) (0412, 0412-L –1) (0415, 0415-L –1) (0416, 0416-L –1) (0430, 0430-E –1) (0431, 0431-E –1) (0438, 0438-E –1) (0442, 0442-L –1) (0465, 0465-L –1) (0466, 0466-L –1) (0467, 0467-L –1) (0469, 0469-L –1) (0474, 0474-L –1) (0473, 0473-L –1) (0471, 0471-L –1) (0470, 0470-L –1)

Public Comment: The increased noise can be expected from the additional trains on the new track and at the WFC train storage and maintenance yard. This noise may be exacerbated by a tunnel at the train yard concentrating and directing noise at the Westhampton neighborhood. It is requested additional sound barriers as well as reinforcement of existing sound barriers be included. (0422, 0422-E –1)

Public Comment: While we recognize the necessity of developing new transportation infrastructure in Northern Virginia, and the appropriateness of extending the Washington Area Metro into the Dulles Corridor toward Reston, we are very concerned that any such project must include significant mitigation of noise pollution, air pollution, water pollution and traffic impacts to the Westhampton neighborhood near the West Falls Church (WFC) Metro Station. Specifically, we are concerned that any and all mitigation strategies must be designed to mitigate peak noise levels from the proposed new WFC train yard rather than mitigate average levels. This should consider noise levels from the train yard in combination with noise from I-66 and the Dulles Access highway. Such mitigation should go beyond short walls around the tracks themselves and include additional sound reduction measures. (0388, 0388-L-1)

Public Comment: Before this project gets final approval in December 2002, we would request further discussion about this added track spur into the Metro Maintenance Yard and the disruptions it will cause in the future to our lifestyles. Few people object about the need of a rapid transit system to Dulles Airport and beyond, but please do not forge ahead without taking local neighborhood considerations such as ours, with high decibel noise levels, into serious consideration (0089, 0089-L –2)

Public Comment: Metro has always told us they want to be a good neighbor. Let's hope they become a better neighbor in alleviating irritating noise levels now and in the future with the new transit project. I'm sure our neighbors would welcome future meetings to discuss this important matter before any approval is given and any new construction begins. (0089, 0089-L –3)

Public Comment: Many problems have been bought to the attention of Metro over the years. Personally I've complained on different occasions and was advised in most cases the message would be passed on. Nothing happens. No return call. No change regarding the problem. My experience in recent years is that Metro does not care, and pays no or little attention to other people's inconvenience, loss of sleep, or proper compliance to local noise limits. (0417, 0417-L –2)

> ***Response:*** *With respect to the concerns of communities on the noise of the Metrorail West Falls Church Yard, the Project Team recommended and the decision-makers approved the enclosure of 1) a portion of the existing loop track at the yard's eastern end and 2) the new yard lead in box structures. These noise mitigation measures by the Project will reduce the wheel squeal noise of the train movements within the Yard. The Project Team notes, however, that new residences have been recently constructed and occupied adjacent to the West Falls Church S&I Yard without any noise mitigation provided by the residential developer. As during the past ten-year effort to address yard noise, there will be coordination among DRPT, WMATA, Fairfax County officials and staff, and representatives of the communities during preliminary engineering and final design.*
>
> *The number of additional cars at West Falls Church Yard has increased from 26 in the Draft EIS to 42 in the Supplemental Draft EIS and Final EIS in order to support the Metrorail fleet of the Wiehle Avenue Extension. Wheel squeal from the new yard lead (for Metrorail trains to and from the Dulles Corridor Line) at the east end of the yard was included in the modeling analysis. Based on measured noise levels from the current wheel squeal along a similar radius curve at the yard, exceedances of the FTA impact criteria are predicted at nearby residences. No exceedances are predicted from the Project's aerial guideway in the median of the Dulles Connector Road.*
>
> *Other noise sources, such as train horns, were not included in the modeling analysis. Brake squeal was not determined to be a major problem. Based on the current operating schedule at the yard, the increase in the overall yard noise due to the cleaning and general operation of 42 additional Metrorail cars needed for the Project is expected to be minimal.*

Construct Loudoun County Rail Yard First to Reduce Impacts at West Falls Church

Public Comment: This is an addition to my first comment page. I think the train yard out in Loudoun County should be built early in the process so the new trains going on the new rail line do not have to use the West Falls Church yard. There already is too much noise from wheel squeal now. We don't want any more. (0029, 0029-CC-1)

> ***Response:*** *Thank you for your comment. Construction of the major Metrorail yard on Airport property is dependent on the construction of the Full LPA of 23.1 miles.*

Analyze Noise Impacts Based on Peak Noise Levels

Public Comment: The noise level from the metrorail yard and the Dulles Connector Road is already intolerably high in our neighborhood [Greenwich Street]. We are skeptical that noise measurements cited

in the EIS reflect the true extent of the problem. Peak noise levels, not 24-hour averages, are needed to reasonably assess the impact of the quality of life in our community. (0389, 0389-E –3)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995)to determine the applicable noise impact criteria in all areas of the proposed corridor. The FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas such as yours with higher background levels, Project noise limits established by the FTA are more stringent than in quieter areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.*

As described in Section 4.7 of the Final EIS, the noise analysis was conducted according to the FTA guidelines. Accordingly, the peak-hour equivalent noise level (or Leq) was used to evaluate impacts at non-residential receptors; and the 24-hour day-night noise level (or Ldn) was used to evaluate impacts at residential receptors. Although the FTA criteria are defined in terms of allowable project exposure, the basis for the FTA criteria is actually the increase in the cumulative noise (i.e., when the levels are added to the existing noise). To be conservative (or to determine the "peak cumulative noise output"), the modeling analysis included maximum operating volumes for all time periods under the two Build Alternatives. For example, the Friday-Saturday Metrorail schedule was selected to correspond with the extended operating hours from the then 5:30 AM to 2:00 AM. Furthermore, as described in Section 4.7 (Methodology), the total predicted project Ldn/Leq noise level at receptors includes all sources proposed as part of the Dulles Corridor Rapid Transit Project including Metrorail passbys, auxiliary equipment, wheel squeal, bus idling and typical activities at passenger stations such as public address announcements.

In addition to the FTA cumulative noise criteria, peak or maximum noise levels (or Lmax) from transit operations were also used to evaluate Project impacts using the WMATA Design Criteria for various residential land-uses. The Lmax noise level is independent of the existing background and the number of operations and represents the maximum level observed during a single event, such as a Metrorail or bus passby. The projected levels are shown in Section 4.7 of the Final EIS.

Although newer pre-cast concrete track structures are proposed to minimize excessive noise and vibration levels, the modeling analysis included a 4-decibel penalty to account for potential structural noise due to Metrorail passbys along all elevated sections of slab track. As described in Section 4.7 of the Final EIS, where exceedances of the FTA or the WMATA impact criteria are predicted, mitigation measures are proposed and will be refined during preliminary engineering and final design.

EIS Underestimates Noise Impacts on Homes Along the Dulles Airport Access Road

Public Comment: In terms of the present Environmental Study, the noise assessment is a complex set of self-serving measurements that completely obfuscate the reality that it is impossible to sleep with open windows or carry on a quiet conversation outside of those homes bordering the Access Road. (0087, 0087-L –4) (0087, 0227-E-2)

Public Comment: We will demonstrate that existing noise levels already demonstrate that the neighborhood is already in the 'Red Severe Impact Zone". The noises from the construction and operation of the Dulles Transit Project will create an even more severe impact and hardship for the neighborhood. (0174, 0300-L –1)

Public Comment: Clearly, the current noise problems will only be exacerbated by the proposed project. To show you how bad this is even today, I invite you to call and come to my home, to sit on my deck, and to see and hear for yourself. This situation should not be ignored. (0414, 0414-L –3)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. As described in Section 4.7of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact.*

Noise Analysis Should Consider Impacts of Metrorail Alternative Combined with Existing Background Traffic

Public Comment: To cite only FTA policy guidance on noise mitigation misses the largest point. We believe that FHWA policy and VDOT's own policy should be applied to this coordinated high-rail highway project, especially given the past underestimates of vehicle usage. Density bonuses awarded to those who build within 1600 feet of metro stations will generate even more vehicular traffic. The problem we have with the EIS is that if your estimates and guesses are wrong, we have to live with. The traffic projects were very wrong, and we are living with it, and hearing it. (0137, 0137-T –5)

Public Comment: Our concern is NOISE. The Dulles Corridor, at our location, was projected (in 1982) to have an average vehicle count of 41,600 by the year 2000. By 1995, by VDOT count, that projection was already exceeded by 50%! By this project's projection for 2025, that vehicle average will be 86,000, and could be nearly double that, if you believe VDOT's projection for the segment near the Beltway. Thus, by the time this project is operational, the number of vehicles in our section of this corridor could easily have tripled from the projection made in 1982. When you compare that to the projections for the increase in jobs, population and work trips (all in and around this same corridor), such traffic increases may even be woefully underestimated - Metro or not. All of those 250,000 work trips projected for the corridor will not be able to use Metro. VDOT has said that regionwide use of transit is perhaps no more than 3% of trips. The Draft EIS projects that somewhere between 70% and 80% of corridor work trips will not, or cannot, use Metro. They will use their cars. Now, imagine you are standing on the Dulles Corridor pavement between Old Chain Bridge Road and Route 123. Eighty feet away, you can easily see into the second stories of our homes at eye level. Now add to that idyllic scene 216 tons of speeding high tech metal on 48 wheels as it grinds around the elevated curve into Tysons and screeches to a halt at Tysons East station - some 60 feet in the air! And yet, the Project's Draft EIS states that only the incremental noise due to the addition of rail service is assessed. What happened to the 86,000 to 143,000 average daily vehicles (traveling at 65 mph and including mail trucks, buses and motorcycles)? Luckily I am only a lay citizen, not an engineer. As a citizen, I am questioning and cautious - as an engineer I would be incredulous and terrified! (0137, 0176-L –3)

Public Comment: Our concern is NOISE. The Dulles Corridor, at our location, was projected (in 1982) to have an average vehicle count of 41,600 by the year 2000. By 1995, by VDOT count, that projection was already exceeded by 50 percent! By this project's projection for 2025, that vehicle average will be 86,000, and could be nearly double that, if you believe VDOT's projection for the segment near the Beltway. Thus, by the time this project is operational, the number of vehicles in our section of this corridor could easily have tripled from the projection made in 1982. When you compare that to the projections for the increase in jobs, population and work trips (all in and around this same corridor), such traffic increases may even be woefully underestimated - Metro or not. (0137, 0224-M –2)

Public Comment: The Dulles Corridor at our location was projected in 1982 to have an average daily vehicle count of 41,600 by the year 2000. By 1995, the actual count exceeded that by 50 percent. According to the EIS, that vehicle count is projected to reach 86,000 by 2025 and could be nearly double that if you believe VDOT's figures for the segment near the beltway. Thus, by the time this project is operational, the number of vehicles in our section of this corridor could easily have tripled from the projection made for 2000. When you compare that to your projections for the increase in corridor jobs, population and work trips, such vehicular traffic increases may be even woefully underestimated,

metrorail or not. All of those 250,000 work trips projected for the corridor will not use Metro. Some 70 or 80 percent will use their own cars. Now imagine you are standing on the Dulles Corridor pavement between Old Chain Bridge Road and Route 123. Eighty feet away you can see clearly into the second stories of our homes at Hallcrest Heights at eye level. Now add to that scene 216 tons of speeding high-tech metal on 48 wheels as it grinds around some 25 feet overhead around the elevated curve into Tysons and screeches to a halt at Tysons East. The project's draft EIS states that only the incremental noise due to the addition of rail service is assessed. What happened to the 86,000 to 143,000 average daily vehicles traveling below on the so-called Dulles connector? (0137, 0137-T –2) (0137, 0137-T-2)

Public Comment: The problem with your EIS and Noise Technical Report is that if your estimates and guesses are wrong, we have to live with it. The traffic projections were wrong, and we are living with it! You have our support for your project. Give us rail service…but not an eyesore and an earsore. (0137, 0176-L –9) (0137, 0224-M-9)

> ***Response:*** *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. As described in Section 4.7.2 (Evaluation Criteria) of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact.*
>
> *There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near the Ronald Reagan Washington National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.*
>
> *Additionally, the FTA guidelines were used to evaluate potential impacts due to transit operations. Impacts due to traffic were evaluated using the Federal Highway Administration (FHWA) guidelines only in those areas where the existing roadways would be modified or substantially changed (e.g., near Metrorail pocket tracks that would require a "bubbling" of the roadway). Because no modifications to the roadway are proposed near the identified communities, a future traffic analysis using the FHWA guidelines was not required and therefore, was not conducted.*

Concrete Parapets Inadequate to Mitigate Metrorail Alternative Noise

Public Comment: Our second problem with the analysis as it relates to noise is that you have not suggested adequate mitigation. We hear Metro trains today as they travel at ground level. The EIS would have us believe that you can raise those trains above ground level, above the inadequate and broken old VDOT metal sound barriers, above the wooden barriers that are no longer effective, and mitigate the noise with five-foot concrete parapets next to the tracks. We don't believe it. The parallel barrier, in fact, from such a scheme may well magnify, not mitigate, the noise. Your own engineers have said that those five-foot parapets were used on the elevated rail on the Red Line where it crosses the beltway at Pooks Hill. There an expensive retrofit was necessary. (0145, 0145-T –*7)*

Public Comment: Our second problem with your analysis as it relates to noise is that you have not suggested adequate mitigation. We hear Metro trains today as they travel at ground level. The EIS would have us believe that you can raise those trains above ground level, above the inadequate and broken old VDOT metal sound barriers, above the MWAA wooden barriers that are no longer effective,

and mitigate the noise with three or five-foot concrete parapets next to the tracks. Please provide data that demonstrates the effectiveness of the proposed mitigation strategies. And please take a more careful look at the proposed breaks in the parapets and their heights. We [Ellison Heights-Mt. Daniel] believe there may be a need for the parapets to be continuous and five feet tall from start to end (from the I-66 beginning to the end proposed). (0145, 0452-E –4)

Response: *The effect of noise reflections due to large flat vertical structures will be investigated during preliminary engineering. Acoustically absorptive treatment is typically applied to both sides of parallel barriers to eliminate barrier degradation due to the "parallel barrier" effect.*

Although the potential for additional structural noise was included in the noise assessment, it is highly unlikely due to the newer structural designs proposed along the Dulles Corridor. Pre-cast concrete supports, resiliently-supported ties, and continuously welded rail track included in the proposed track design all combine to greatly minimize overall noise and vibration levels from train passbys along aerial sections.

Additionally, three to four-foot parapets (or track edge barriers) are proposed as part of the design along all aerial Metrorail sections (except on Airport property). Based on the assumed Metrorail source height of two feet above rail combined with the top-of-rail elevation, the three to four-foot parapet height is predicted to effectively shield train passbys at nearby residences.

Using Only FTA Policy on Noise Mitigation is Inadequate

Public Comment: To cite only FTA policy guidance on noise mitigation, because presumably only rail service is being added, is not only short sighted, it misses the larger point. The Draft EIS even makes the point that the Dulles Connector (our section of the corridor) is planned for an additional two lanes. Would that be the case if a lot of new traffic were not envisioned? MWAA has already told us that they will not retrofit our community [Hallcrest Heights] with a more appropriate barrier. We will not wait until the connector is widened to have them tell us that again; this time adding that rail service is not their problem. (0137, 0176-L –7) (0137, 0224-M-7)

Public Comment: To avoid needless repetition in this record, we would like to join wholeheartedly in the position of the Ellison Heights-Mt. Daniel Civic Association submitted orally at the July 29 public hearing number 147, and presumably filed in the docket. Based on the analysis and commentary in the EIS, the noise impacts, both during and on completion of the project are clearly deficient. We, of course, cannot afford to hire experts to disprove your 'studies', but in many respects they just don't make common sense, and in some ways the conclusions contradict each other and past Metro experience. The Ellison Heights-Mt. Daniel testimony speaks directly to the specific items and issues in question. (0126, 0126-E –4) (0126, 0199-M-4)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. As described in Section 4.7 of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact. Mitigations for potential noise impacts are also discussed in Section 4.7of the Final EIS.*

Additionally, the FTA guidelines were used to evaluate potential impacts due to transit operations. Impacts due to traffic were evaluated using the Federal Highway Administration (FHWA) guidelines only in those areas where the existing roadways would be modified or substantially changed (e.g., near Metrorail pocket tracks that would require a "bubbling" of the roadway). Because no modifications to the roadway are proposed near the identified communities, a future traffic analysis using the FHWA guidelines was not required and therefore, was not conducted.

Measuring Noise Impacts at Ground Level

Public Comment: One DOT engineer told us that the sound measurements are made at ground level. It that is true, I am sure that the gophers really appreciate it. The rest of us live 5 to 20 feet above ground level. (0087, 0087-L –10) (0087, 0227-E –8)

> ***Response:*** *All noise measurements conducted along the Project corridor were collected in accordance with good engineering practice and the guidelines and standards set forth in the FTA guidelines (Transit Noise and Vibration Impact Assessment, 1995), the American Society for Testing and Materials (ASTM) Standard Guide for Measurement of Outdoor A-weighted Sound Levels (1984), and the American National Standards Institute (ANSI) Method for the Measurement of Sound Pressure Levels (1981). Accordingly, ambient noise measurements are conducted at ground level with the microphone placed 5 feet above the ground (the approximate average height of human ears). Ground level noise measurements are typically used as a surrogate for all other elevated residences at the monitoring location. At ground level, where maximum noise attenuation and shielding occur (yielding a lower noise level), Project criteria threshold limits are determined to be most stringent based on the FTA impact assessment curves.*

Proposed Three-Foot Sound Barriers Will Increase Ambient Noise Impacts on Neighborhoods

Public Comment: The sound amelioration outlined in the Environmental Study is ridiculous. Putting 3-foot barriers next to the tracks may help reduce the sound experienced by the cars on the Dulles Access road, but will only amplify the ambient sound spilling out into the residential areas higher than your proposed barriers. (0087, 0087-L –12) (0087, 0227-E –10)

> ***Response:*** *As part of the overall track design, three to four-foot parapets (or track edge barriers) are proposed along all aerial Metrorail sections (except on Airport property). Based on the assumed Metrorail source height of two feet above rail combined with the top-of-rail elevation, the three to four-foot parapet height is predicted to effectively shield nearby residences from Project-related train passby noise. Acoustically absorptive treatment along the trackside of the parapets would further improve the shielding benefits of the structural parapets. See Section 4.7 of the Final EIS for more information.*

Noise Analysis Along Miracle Lane and Penguin Place

Public Comment: Although we have neither the time nor the hordes of engineers to unravel the figures provided in section 4 of the Environmental Study, some points even the layman can understand are:1. No measurements were taken along Miracle Lane and Penguin Place, even though both areas directly adjoin the Dulles Access Road and are severely impacted by the road noise. Was this intentional? (0087, 0087-L –5) (0087, 0227-E –3)

> ***Response:*** *Noise measurements were conducted at 30 representative receptor locations to account for the various land use types found along the 23-mile Project corridor. Ambient noise measurements representative of your neighborhood were conducted at a residence at 7103 Norwalk Street approximately 1,500 feet to the south. The noise measurement program conducted along the Project corridor was conducted in accordance with good engineering practice and the guidelines and standards set forth in the FTA Transit Noise and Vibration Impact Assessment (1995), the ASTM Standard Guide for Measurement of Outdoor A-weighted Sound Levels (1984), and the ANSI Method for the Measurement of Sound Pressure Levels (1981).*

EIS Noise Analysis Conflicts with 1982 Study of the Dulles Airport Access Road

Public Comment: The 1982 environmental study for the Dulles Access Road showed that the noise level would be high impact for this area (based on far less traffic than the road now carries). Yet your study purports to show less noise even with more buses and trains! (0087, 0087-L –6) (0087, 0227-E –4)

> ***Response:*** *The Project Team utilized the guidelines included in the FTA Transit Noise and Vibration Impact Assessment (1995) to evaluate impacts from transit operations on nearby receptors. Based on the FTA guidelines, an ambient noise-monitoring program was conducted to establish the Project criteria limits. Future Project noise levels from Metrorail operations and facilities only were compared with the established criteria limits to determine the location and severity of impact as prescribed by the FTA methodology. The FTA criteria are based on cumulative noise levels that vary with the existing background noise level (i.e., louder areas allow less additional Project noise) before impact is identified and thus reflect different land-uses found along a transit corridor. Current ambient noise levels may be lower than the 1982 levels due to the construction of noise barriers since that time.*

Consideration of Fairfax County Noise Level Policies

Public Comment: The Fairfax County acceptable noise level for residential areas is 55 dba. In your scores of pages of definitions why was this fact conveniently omitted? Is it because this factor is exceeded in even less exposed locations than ours? (0087, 0087-L –7) (0087, 0227-E –5)

> ***Response:*** *As described in Section 4.7 of the Final EIS, the Fairfax County noise ordinance (Code of the County of Fairfax, Chapter 108, January 1, 1976) of 55 dBA at residential receptors and 60 dBA at commercial receptors applies to stationary sources and facilities. The Fairfax County noise criteria were used to evaluate noise impacts from Project-related stationary facilities such as passenger stations, park-and-ride facilities, and rail yards. Where exceedances of the Fairfax criteria are predicted, proposed mitigation measures are identified in the Final EIS and will be evaluated further during preliminary engineering and final design.*

Noise Analysis Does Not Adequately Reflect Roadway Noise

Public Comment: Your averaging factor for sound noise does not adequately reflect the impact of the roadway noise. Adding 10 dba to the average figures is a poor substitute for actuality. How often per night do you have to be awakened by buses shifting gears on the curve or high-revving motorcycles before you give up and seal your windows permanently? (0087, 0087-L –8) (0087, 0227-E –6)

> ***Response:*** *The modeling analysis evaluated impacts from future Project operations only. Specifically, the noise assessment utilized the guidelines included in the FTA Transit Noise and Vibration Impact Assessment (1995) to evaluate impacts from transit operations on nearby receptors. According to the FTA guidelines, existing ambient noise due to current traffic levels is represented in the criteria threshold limit selected for each land-use area (e.g., louder areas allow less Project noise). The impact assessment of the Project criteria is based on future 2025 Design Year Project levels only, not existing or future traffic levels. As a result, mitigation generally focuses on Project only impacts related to Project operations.*
>
> *The 24-hour day-night noise level (or Ldn) is adopted as a measure of cumulative noise impact for residential land-uses where sleep is involved for the following reasons:*
>
> - *The Ldn noise level correlates well with residential annoyance surveys;*
> - *The Ldn noise level increases with an event's duration corresponding further with resident's annoyance level;*
> - *The Ldn measure incorporates all events that occur over a 24-hour period;*

- *The Ldn level takes into account people's increased sensitivity to nighttime noise, when most people are asleep, by adding in a 10-decibel penalty for nighttime events between 10 PM and 7 AM; and,*
- *The Ldn is the designated measure of choice of several other federal agencies including the Federal Aviation Administration, the Environmental Protection Agency and the Department of Housing and Urban Development.*

Using Current Noise Levels as Basis for Evaluating Noise Impacts is Flawed

Public Comment: Using the currently unacceptable noise levels as a starting point is self-serving. It buries your additional noise behind the transgressions previously made by the Metropolitan Airports Authority in constructing the Dulles Access Road. Of course it does provide a convenient out in terms of escaping from any responsibility even though the rail would add to the noise level. (0087, 0087-L –9) (0087, 0227-E-7)

Response: *The Project Team utilized the guidelines established by the FTA in Transit Noise and Vibration Impact Assessment (1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. The FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact.*

Proposed Five-Foot Parapet Inadequate to Mitigate Noise of Metrorail Alternative

Public Comment: Acoustical engineers and other noise consultants talk in terms of DBA, LEQ, LDN, VdB. In plain English that means din, rumble and squeal. Din is ambient noise level of the whole corridor, which is considerable now. Rumble is what happens whey you add those 216 tons of six-car Metro trains, and squeal is what you get when those 48 steel wheels speed around the elevated curve prior to the brakes being applied. And yet your draft EIS says this will all be perfectly okay if you just add a five-foot parapet to either side of the track. My skepticism is monstrous. Ask anyone who now lives near an elevated Metro line, and we will. (0137, 0137-T –3)

Public Comment: Acoustical engineers and other noise consultants talk in terms of dBA, Leq, Ldn and VdB. In my terms, that means "din," "rumble," and "squeal." "Din" is the ambient noise level of the whole corridor, and it is considerable now. "Rumble" is what happens when you add those 216 tons of 6-car Metro trains. And "squeal" is what you get when those 48 wheels speed around an elevated 750 foot radius curve of steel rails, prior to the brakes being applied. None of that takes into account the effect of constructing this high speed flyover - pilings and all! And yet…under the quaint title of "mitigation," your Draft EIS says that all of this will be perfectly OK if you just add a 5 foot parapet to either side of the railbed. My skepticism exceeds the traffic projections! Metro tried such a solution to the elevated Red Line over the Beltway…and they had to go back and retrofit it with special measures to address the vibration & noise. One non-resident owner at Hallcrest lives near this spot and he tells me he hears every train. And he is a half mile away! (0137, 0224-M –4) (0137, 0176-L –5)

Response: *There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. To better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.*

Noise Analysis Should Include Impact of Increased Traffic Using FHWA and VDOT Policies

Public Comment: FHWA policy, Interstate Standards and VDOT's own policy should be applied to this project - especially given the past underestimation of vehicle usage and development. Density bonuses awarded to those who build within 1600 feet of Metro stations, will generate more vehicular traffic as well as Metro ridership. My guess is that Metro's system in downtown DC is size constrained anyway. (0137, 0176-L –8) (0137, 0224-M-8)

> ***Response:*** *The Project Team utilized the guidelines established by the FTA in Transit Noise and Vibration Impact Assessment (1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. The FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas, such as yours, with higher background levels, Project noise limits established by the FTA are more stringent than in quieter areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.*
>
> *Additionally, the FTA guidelines were used to evaluate potential impacts due to transit operations. Impacts due to traffic were evaluated using the Federal Highway Administration (FHWA) guidelines only in those areas where the existing roadways would be modified or substantially changed (e.g., near Metrorail pocket tracks that would require a "bubbling" of the roadway). Because no modifications to the roadway are proposed near the identified communities, a future traffic analysis is using the FHWA guidelines was not required and, therefore, was not conducted.*

Construction/Operation Activities from BRT and Metrorail Alternatives will Worsen Noise Levels

Public Comment: Construction activities and operation of either the Bus or Metrorail alternatives will aggravate an already serious noise situation, especially because the buses and/or the Metrorail are major contributors to noise and will operate until midnight during the week and 2 am on weekends. (0174, 0300-L –4)

> ***Response:*** *The noise modeling analysis evaluated impacts due to daytime construction activities only. Changes to the proposed construction schedule will be evaluated in preliminary engineering and appropriate mitigation measures will be proposed if exceedances of the Project nighttime construction criteria are predicted.*
>
> *Additionally, the operating times and vehicle characteristics of both Metrorail were included in the noise modeling analysis. For example, the Friday – Saturday Metrorail schedule was selected to correspond with the extended operating hours from the then 5:30 AM to 2:00 AM. Specifically, the noise assessment utilized the guidelines included in the FTA's Transit Noise and Vibration Impact Assessment (1995) to evaluate impacts from Metrorail on nearby receptors. Accordingly, mitigation measures are proposed in those areas where exceedances of the FTA impact criteria are predicted as described in Section 4.7 of the Final EIS.*

Increased Density will Increase Noise and Traffic Effects on Hallcrest Heights

Public Comment: VDOT's noise criteria were judged not to apply because "no other roadways changes affecting either capacity or elevation are expected…" This is a narrow and not totally accurate viewpoint since both VDOT traffic projections and expectation for increased vehicle usage stemming from density allowances, will substantially increase traffic in the Dulles Connector section that adjoins our community [Hallcrest Heights]. The EIS references plans to widen the Connector [Road], giving further indication of the prospect of vehicular traffic. The EIS should broaden its noise abatement scope to include both MWAA and VDOT policy as well as that of the FTA. (0137, 0304-L –1)

Response: *Except where noted, no other changes to the existing roadways are proposed as part of the Dulles Corridor Rapid Transit Project. Any other roadway changes are part of other projects sponsored by either the VDOT or the MWAA, and are independent of this Project*.

Need Mitigation for Noise Caused by Turnouts (Switches)

Public Comment: Noise -- Noise analysis did not consider the effect of turnouts (switches). Measures to mitigate resulting noise and vibration such as resilient track fasteners, movable frogs or some similar measures, need to be identified. (0387, 0387-L –19)

Response: *As described in Section 4.8 of the Final EIS, potential vibration impacts from Metrorail passbys due to rail discontinuities were evaluated in the modeling analysis. At those locations where exceedances of the project vibration criteria are predicted, mitigation measures are proposed and will be refined during preliminary engineering and/or final design.*

Noise Evaluation Should Include Peak Cumulative Noise Output

Public Comment: Deficiencies in the noise analysis. The analysis is based on average rather than peak noise levels and does not consider the cumulative affect of noise from the train yard, the highway and the metal track support. The peak cumulative noise output (i.e., train on metal track support plus train yard plus highway) after mitigation has not been quantified. (0386, 0386-E –2) (0398, 0398-L –2) (0399, 0399-L –2)(0412, 0412-L –2) (0415, 0415-L –2) (0416, 0416-L –2) (0430, 0430-E –2) (0431, 0431-E –2)(0438, 0438-E –2) (0442, 0442-L –2) (0465, 0465-L –2)(0466, 0466-L –2) (0474, 0474-L –2) (0473, 0473-L –2) (0471, 0471-L –2) (0470, 0470-L –2) (0467, 0467-L –2) (0469, 0469-L –2)

Response: *As described in Section 4.7.2 (Evaluation Criteria) of the Final EIS, the noise analysis was conducted according to the FTA Transit Noise and Vibration Impact Assessment ((1995) guidelines. Accordingly, the peak-hour equivalent noise level (or Leq) was used to evaluate impacts at non-residential receptors; and the 24-hour day-night noise level (or Ldn) was used to evaluate impacts at residential receptors. Although the FTA criteria are defined in terms of allowable Project exposure, the basis for the FTA criteria is actually the increase in the cumulative noise (i.e., when the Project levels are added to the existing noise). To be conservative (or to determine the "peak cumulative noise output"), the modeling analysis included maximum operating volumes for all time periods under both the Metrorail and the BRT Alternatives. For example, the Friday-Saturday Metrorail schedule was selected to correspond with the extended operating hours from the then 5:30 AM to 2:00 AM.*

However, in addition to the FTA cumulative noise criteria, peak or maximum noise levels (or Lmax) from transit operations were also used to evaluate Project impacts using the WMATA Design Criteria for various residential land-uses. The Lmax noise level is independent of the existing background and the number of operations and represents the maximum level observed during a single event, such as a Metrorail or bus passby.

Although newer pre-cast concrete track structures are proposed to minimize excessive noise and vibration levels, the modeling analysis included a 4-decibel penalty to account for potential structural noise due to Metrorail passbys along all elevated sections of slab track. As described in Section 4.7of the Final EIS, where exceedances of the FTA or the WMATA impact criteria are predicted, mitigation measures are proposed and these measures will be refined further during preliminary engineering and final design.

Questions About Noise Impacts on the Rotonda Condo Units

Public Comment: The projected noise levels at International Drive and Westpark Drive (Location R12) do not appear to represent the sound levels within the condominium units resulting from the elevated rail adjacent to the Rotonda. These could exceed FTA guidelines. I doubt if sound buffers could reduce this

sufficiently. Also, it does not appear that the number of living units affected by the noise have been cited, the Rotonda seems to be counted as one receptor. (0429, 0429-E –4)

Public Comment: The issue of intermittent noise intrusion from passing trains and wheel squeal adjacent to the Rotonda is not sufficiently addressed. (0429, 0429-E –5)

> ***Response:*** *These comments concerned the potential effects of Alignment T4, which was eliminated from further consideration after the public and agency review and comment on the Draft EIS. No noise impact is projected in the vicinity of the Rotonda.*

Metrorail Noise Will Adversely Affect Home Value

Public Comment: The value of our home will be adversely affected with any of the current build alternatives. We will have trains flying outside our bedroom windows at 1 1/2 minute intervals at rush hour (3 min./side). Our privacy loss will be tremendous. We don't hear average sounds and yet all analysis is based on averages. I want to know what the cumulative peak sound will be on my deck when you add rush hour freeway, Metro above ground on metal and concrete beds, new feeder buses, extra track, and more yard work. We estimate it will be greater than a jack hammer at 50 feet. Our values are already falling. How will we be compensated? It is unfair to subject us all to a combo of aerial Metro above and sound and visual wall, freeway and rail yard. Plus the train making a 90 degree turn. Take the thing underground for this unusual combo of factors. Nowhere in the system are residents subjected to all three of these huge noise sights at the same time. (0398, 0398-L –13)

> ***Response:*** *The modeling analysis evaluated impacts from future proposed Metrorail operations in accordance with the FTA's Transit Noise and Vibration Impact Assessment (1995) guidelines. The 24-hour day-night noise level (or Ldn) is adopted as a measure of cumulative noise for residential land uses where sleep is involved for the following reasons:*
>
> - *The Ldn noise level correlates well with residential annoyance surveys;*
> - *The Ldn noise level increases with an event's duration corresponding further with resident's annoyance level;*
> - *The Ldn measure incorporates all events that occur over a 24-hour period;*
> - *The Ldn level takes into account people's increased sensitivity to nighttime noise, when most people are asleep, by adding in a 10-decibel penalty for nighttime events between 10 PM and 7 AM; and,*
> - *The Ldn is the designated measure of choice of several other federal agencies including the FAA, the EPA, and the Department of Housing and Urban Development.*
>
> *Historically, property values have risen in areas where greater access to Metrorail has been provided.*

Need More Consideration of Noise Impacts on Neighborhoods Near East and West Falls Church Metrorail Stations

Public Comment: There needs to be more consideration given to the noise and traffic impact to all neighborhoods around East and West Falls Church metro stations. Too many neighborhoods were left out of this study area. (0179, 0179-T –10)

Public Comment: My neighborhood's concerns revolve around noise, vibration and traffic. My community borders I-66, rail and the West Falls Church transit station. Ironically, my community was not listed as an impacted neighborhood, nor was the Villages condominium complex right next to the Pavilion, nor were the three neighborhoods bordered by I-66, Haycock Road and Great Falls Street, a triangle of land where residents already suffer significant noise impacts from I-66 and the connector split. You didn't include the Lemon Road community, one that already suffers from the noise from your maintenance yard. (0145, 0145-T –3)

Response: *Neighborhood impacts were assessed in Section 3.2 of the Final EIS. Neighborhoods within 300 feet of the centerline of the Build Alternatives alignments and within one half-mile of the proposed station areas were identified for evaluation. This area was reviewed after the noise, vibration, air quality, and visual effects analyses were completed and several additional neighborhoods and community facilities were added to the study area. For each of these neighborhoods evaluations for changes to community cohesion, isolation effects, displacements, noise and vibration, access changes, and safety were conducted. For example, the Pavilion and Hallcrest Heights were added to the study due to projected noise effects. Neighborhoods that are located between the East Falls Church and West Falls Church stations and that are already in close proximity to rail were not included in the analysis, since there were no projected changes in service due to the Project in this section of the corridor.*

The comment references several neighborhoods, including a community that borders I-66, Metrorail and the West Falls Church Station; the Village condominium complex, three neighborhoods bordered by I-66, Haycock Road, and Great Falls Street; and the Lemon Road community. Three neighborhoods were evaluated within the Project boundaries in the vicinity of I-66 and the West Falls Church Station: Idylwood (which would include all residences south of the Dulles Connector Road and north of I-66 in close proximity to the station) that would experience noise impacts; the Pavilion (which has a direct view of the West Falls Church station and would experience visual effects during construction); and the Westhampton neighborhood (which includes all residences between Great Falls Street, Haycock Road and northeast of the Dulles Connector and which would experience noise impacts).

The first area referenced in the comment would (most likely) be located in the Idylwood neighborhood or Westhampton neighborhood. The Village condominium complex was not included because no impacts were projected. The three neighborhoods bordered by I-66, Haycock Road, and Great Falls Street, and the Lemon Road communities are located outside of the study area boundaries, but would have been included in the analysis of traffic and noise effects if any effects were identified in these neighborhoods.

Section 6.2 of the Final EIS and Chapter 8.0 of the Traffic Analysis and Station Access Technical Report (June 2002) both state that large increases in vehicle trips are not anticipated for the West Falls Church Station area for the two Build Alternatives.

Revise EIS to Discuss Mitigation of Cumulative Highway and Train Noise on McLean Communities

Public Comment: Noise: The EIS does not consider the impacts of noise from additional vehicular traffic that will result from density increased that can be granted to landowners when rail is built. This additional vehicular noise is additive with the noise generated by trains in the rail alternatives. For the rail alternatives, the EIS should be revised to analyze the cumulative noise impacts of increased vehicular traffic together with noise from the passing trains. The impact analysis for McLean should focus on the Dulles Airport Access Road connector between I-66 and Dolley Madison Boulevard and the Dulles Toll Road between Route 7 and Hunter Mil Road. The EIS should be revised to discuss the noise abatement measures that would be implemented to mitigate this cumulative highway and train noise impact. (0392, 0392-L –18)

Response: *The FTA* Transit *Noise and Vibration Impact Assessment* (1995) *guidelines were used to evaluate potential impacts due to transit operations. Impacts due to traffic were evaluated using the FHWA guidelines only in those areas where the existing roadways would be modified or substantial changed (e.g., near Metrorail pocket tracks that would require a "bubbling" of the roadway). Because no modifications to the roadway near Hallcrest Heights are proposed, a future traffic analysis using the FHWA guidelines was not conducted.*

As described in Section 4.7of the Final EIS, future traffic noise levels under the Metrorail Alternative are predicted to approach or exceed the FHWA impact criteria along the Dulles Corridor just west of Fairfax County Parkway. However, because no roadway changes are

proposed as part of the Dulles Corridor Rapid Transit Project between I-66 and Dolley Madison Boulevard or between Route 7 and Hunter Mill Road, a FHWA traffic analysis was not performed in these areas.

Public Comment: Be it further resolved that the EIS should be substantively revised to address a number of stated concerns of McLean communities detailed in the attached comments and summarized below: Assess and mitigate the total corridor noise both from rail service and elevated trackage as well as from vehicular traffic generated by densities related to rail service. (0392, 0392-L –2)

Response: *As described in Section 4.7of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas, such as yours, with higher background levels, Project noise limits established by the FTA are more stringent than in quieter areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.*

Additionally, the FTA guidelines were used to evaluate potential impacts due to transit operations only. Impacts due to traffic were evaluated using the FHWA guidelines only in those areas where the existing roadways would be modified or substantially changed as a result of the Project. Because no modifications to the roadway along the Dulles Airport Connector Road are proposed, a FHWA traffic analysis was not performed in these areas.

Along elevated sections of track, the aerial structure may exhibit additional noise as a result of train passbys. Although the potential for additional structural noise was included in the noise assessment, it is highly unlikely due to the newer structural designs proposed along the Dulles Corridor. Pre-cast concrete supports, resiliently-supported ties, and continuously welded rail (CWR) track included in the proposed track design all combine to greatly minimize overall noise and vibration levels from train passbys along aerial sections. Additionally, three to four-foot parapets are proposed as part of the design along all sections of aerial guideway (except on Airport property) to further reduce train noise at nearby receptors.

Mitigation measures are identified in Section 4.7 of the Final EIS to eliminate exceedances of the impact criteria predicted along the Project corridor. No new noise barriers are proposed along the Dulles Toll Road property line with the adjacent residences to replace or augment the existing barriers.

Locations and Adequacy of Noise Level Readings

Public Comment: It was noted that increasing train frequency and length will unquestionably result in a net increase in noise levels, but it seems there has been only a limited attempt to determine how much. Also, the decibel levels on the record are the averages of high and low readings. This is not very useful because only the high levels cause noise problems. In addition, there were questions about the locations where noise level readings were taken and at what times of day. (0432, 0432-E –11)

Response: *Cumulative future noise levels are a function of the magnitude of both the ambient background level as well as the noise from transit operations. Although the FTA criteria allow the ambient noise levels to increase 1 to 3 decibels (depending on the current background level), Project noise levels are predicted to increase the ambient level by less than 2 decibels. Where exceedances of the FTA criteria are predicted, mitigation measures are proposed that would reduce the transit noise level below the background. The future noise levels are a logarithmic sum of the predicted Project noise levels and the measured background levels.*

As described in Section 4.7 of the Final EIS, the noise analysis was conducted according to the FTA Transit Noise and Vibration Impact Assessment (1995) *guidelines. Accordingly, the peak-hour equivalent noise level (or Leq) was used to evaluate impacts at non-residential receptors;*

and the 24-hour day-night noise level (or Ldn) was used to evaluate impacts at residential receptors. Although the FTA criteria are defined in terms of allowable Project exposure, the basis for the FTA criteria is actually the increase in the cumulative noise (i.e., when the Project levels are added to the existing noise). To be conservative (or to determine the "peak cumulative noise output"), the modeling analysis included maximum operating volumes for all time periods under two Build Alternatives of the Final EIS. For example, the Friday-Saturday Metrorail schedule was selected to correspond with the extended operating hours from the then 5:30 AM to 2:00 AM. Furthermore, as described in Section 4.7.3 (Modeling Methodology and Assumptions), the total predicted Project Ldn/Leq noise level at receptors includes all sources proposed as part of the Dulles Corridor Rapid Transit Project including Metrorail passbys, auxiliary equipment, wheel squeal, bus idling and typical activities at passenger stations such as public address announcements.

However, in addition to the FTA cumulative noise criteria, peak or maximum noise levels (or Lmax) from transit operations were also used to evaluate Project impacts using the WMATA Design Criteria for various residential land-uses. The Lmax noise level is independent of the existing background and the number of operations and represents the maximum level observed during a single event, such as a Metrorail or bus passby.

Although newer pre-cast concrete track structures are proposed to minimize excessive noise and vibration levels, the modeling analysis included a 4-decibel penalty to account for potential structural noise due to Metrorail passbys along all elevated sections of slab track. As described in Section 4.7 of the Final EIS, where exceedances of the FTA or the WMATA impact criteria are predicted, mitigation measures are proposed and will be refined further during preliminary engineering and final design.

Noise measurements were conducted at 30 representative receptor locations to account for the various land-use types found along the 23.1-mile Project corridor. Ambient noise measurements representative of the commenter's neighborhood were conducted at a residence at 7103 Norwalk Street approximately 1,500 feet to the south. The noise measurement program conducted along the Project corridor was conducted in accordance with good engineering practice and the guidelines and standards set forth in the FTA guidelines, the ASTM Standard Guide for Measurement of Outdoor A-weighted Sound Levels (1984), and the ANSI Method for the Measurement of Sound Pressure Levels (1981).

Need More Attention on Need for Noise Mitigation

Public Comment: I feel that insufficient attention has been given to the need for noise mitigation. (0432, 0432-E-2)

Response: *Where exceedances of the Project criteria are predicted, proposed mitigation measures have been identified (see Section 4.7 of the Final EIS) and will be further refined during preliminary engineering and final design.*

Need to Consider Weather Conditions During Noise Survey

Public Comment: Existing Conditions--The quantification of the existing ambient sound levels apparently was limited to one 24-hr interval on 23 January 2001. While the controlling highway noise source at Hallcrest Heights is likely to be very consistent, substantial variations can occur due to weather conditions. No documentation was given for the weather during the noise survey. (0137, 0176-L –10)

Response: *The noise measurement program conducted along the Project corridor was conducted in accordance with good engineering practice and the guidelines and standards set forth in the FTA guidelines, the ASTM Standard Guide for Measurement of Outdoor A-weighted Sound Levels (1984), and the ANSI Method for the Measurement of Sound Pressure Levels (1981).*

The 24-hour continuous noise measurement was conducted at a residence at 7405 Hallcrest Drive beginning Tuesday, January 23, 2001 at 2:43 PM. Based on the field measurement notes, the weather conditions (clear and calm with an ambient temperature of approximately 40 degrees Fahrenheit) were appropriate for determining the current background level at this receptor location.

Need for Sound Abatement Walls

Public Comment: Sound abatement walls for both the rail system and the Toll/Access Road on both the south and north sides of the roadway. (0075, 0075-CC-4)

Response: *Proposed mitigation measures are identified in Section 4.7 of the Final EIS to eliminate exceedances of the Project impact criteria predicted along the Project corridor. No new noise barriers are proposed along the Dulles Toll Road property line with the adjacent residences to replace or augment the existing barriers.*

Previous Promises to Build Adequate Sound Walls

Public Comment: Broken Promises: The officials made several promises (after an editorial was published in the Washington Post) that a 15-20 foot wall would be constructed on a five-foot berm. The actual wall constructed is 8-10 feet tall and doesn't even block the view of the traffic, much less the noise. Millions of dollars were saved by the re-routing of the road closer to residential property, yet the engineers said it would be too expensive to build a higher soundwall. (0087, 0087-L –3)

Response: *Noise barriers are typically designed to incorporate and benefit from all of the nearby terrain features. Although barriers are designed to shield noise and other unwanted sounds, they are also designed to handle environmental effects including wind sheer, erosion, traffic accidents, and visual or other visibility restrictions. These factors influence the height of the walls. The evaluation of noise impacts conducted for the Dulles Corridor Rapid Transit Project focused on new impacts associated with potential Project implementation in accordance with the FTA transit noise assessment procedures. Section 4.7 of the Final EIS includes a discussion of noise impacts and mitigation measures related to this Project.*

The Project Team did recommend that, with respect to the concerns of communities on the noise of the Dulles Connector Road, the Commonwealth of Virginia would seek to address the existing noise effects upon the residential communities with noise abatement measures. If the Commonwealth decides to proceed with noise abatement measures, it would bear most of the cost of the abatement, since this is an existing condition due mainly to traffic to and from the Dulles Toll Road. The Project itself would share in the cost of abatement proportional to the Project's contribution to the future levels of noise and to its visual effects. DRPT has been identified as the lead agency for the coordination among VDOT, MWAA, WMATA, FTA, Fairfax County officials and staff, and representatives of the affected communities

Upgrade Noise Barriers in Area of Hunting Avenue

Public Comment: The noise barriers existing along the northwestern end of the Dulles Corridor should be upgraded. As a resident of Hunting Avenue, which is parallel to and adjacent to the Dulles Connector Road, I can say that those barriers are too short and thin to prevent high levels of noise even for the current traffic conditions. It is easy to anticipate the noise consequences of the future above-ground metrorail. (0118, 0118-E –2)

Public Comment: I recommend that the construction of metrorail to Tysons Corner include the removal of the existing noise barriers and the construction of new barriers consistent with the current standards of noise protection. (0118, 0118-E –3)

Response: *Parapets (or track edge barriers) are proposed to shield new noise from Metrorail train passbys along all aerial (above-ground) sections of track. At those locations where exceedances of the FTA criteria are still predicted along Hunting Avenue, additional parapet heights (six-feet) are proposed to minimize the predicted Project-related impacts. Changes to the existing highway property line noise barriers along the Dulles Connector Road are not considered part of the Project.*

Recommend a Sound Barrier Constructed Between Beulah and Trapp Roads

Public Comment: We will show that the existing noise levels already put the neighborhood in the red severe impact zone. The noises from construction and operation of the Dulles transit project will create an even more severe impact and hardship for the neighborhood. Our recommendation is that a sound barrier be constructed between Beulah Road and Trapp Road. The Chathams Ford neighborhood is the only residential neighborhood along the Toll Road up to Dulles Airport which does not have a sound barrier. (0174, 0174-T –2)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, Month 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. As described in Section 4.7 of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact.*

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). Figures 4.7-5a and 4.7-5b in the Final EIS are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Requests for Noise Abatement and Sound Barriers

Public Comment: As part of this Rapid Transit Project I am checking to see if there are plans for a sound wall to be put up on our street. If there is no plan for a sound wall to be put up what do we have to do to get one? (0111, 0111-E –1)

Public Comment: Additional noise wall is needed at the north and south ends of Greenwich Street where the track is near grade. Potential usefulness of noise wall along the middle of Greenwich Street, given the topography of the site and plan for elevated track, should be assessed. (0389, 0389-E –2)

Public Comment: Construct a sound barrier between Beulah Road and Trap Road. (0174, 0300-L –2)

Public Comment: This document is submitted to register our strong opposition to the inadequate plans for sound suppression in the area south of the Dulles Access Road between West Falls Church Metro Station and Magarity Road. Despite a history of sham meetings and broken promises, this letter is submitted (if for no other reason than to be on record). (0087, 0227- E –1) (0087, 0087-L-1)

Public Comment: We understand the need for light rail and think it offers the best alternative, but be assured that this citizen and business owner as well as many others will do everything legally possible to delay the assignment of Federal, State, or Country funds until the noise suppression issue west of the West Falls Church Metro Center is addressed adequately. (0087, 0227-E –11)

Public Comment: Therefore, we call for the construction of a large sound barrier along the east side of the Access Road from the bridge that takes Great Falls Road over the Access Road to the bridge that takes Haycock Road over the Access Road. While we would support the construction of additional sound barriers, we believe that we have requested the minimum amount of construction necessary for the protection of our neighborhood. We would expect that any sound barrier constructed be of substantial size and scale to be effective. Ideally, the barrier should include in addition to a concrete wall, the planting of a substantial number of evergreen trees to increase the effectiveness of the barrier. (0435, 0435-E –4)

Public Comment: Noise - Residential neighborhoods must be adequately protected from heavy rail noise, such as from passing trains, wheel squeal from trains rounding curves, etc. (0402, 0402-L –12)

Public Comment: Additional noise mitigation features, such as additional sound barriers and reinforcement of existing sound barriers [Westhampton]. (0386, 0386-E-7) (0398, 0398-L-7) (0399, 0399-L-7) (0412, 0412-L-7) (0415, 0415-L-7) (0416, 0416-L-7) (0430, 0430-E-7) (0431, 0431-E-7) (0438, 0438-E-6) (0442, 0442-L-6) (0465, 0465-L-7) (0466, 0466-L-6) (0467, 0467-L-6) (0469, 0469-L-6) (0470, 0470-L-7) (0471, 0471-L-6) (0473, 0473-L-7) (0474, 0474-L-7)

Public Comment: Additional noise mitigation features, such as additional sound barriers extending along the Dulles Connector Road behind the Westhampton subdivision and reinforcement of existing sound barriers. (0403, 0403-L-6)

> ***Response:*** *Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or the Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b in the Final EIS are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.*
>
> *Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.*

Concern Over Noise Impacts on the West Falls Village Development

Public Comment: The West Falls Village Homeowners Association represents the citizens living in the West Falls Village development. The West Falls Village development consists of homes along the 6600 block of Moly Drive and along Great Falls Road. The homes of West Falls Village are separated from Interstate 66 at the intersection of the Dulles Toll / Access Road (Access Road) by a small and inadequate barrier of trees. Since the homes were built after the highway and Metro lines were in place no sound barrier of any kind has been constructed to protect our neighborhoods from the noise generated by the highway and the Metro. Since this noise already adversely affects our neighborhood, we are greatly concerned about any increase in noise resulting from increased car and/or train traffic along the Access Road. (0435, 0435-E –1)

> ***Response:*** *Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS.*

Figures 4.7-5a and 4.7-5b are included in the Final EIS to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Additionally, no exceedances of the FTA or the WMATA noise impact criteria are predicted along the Moly Drive area of Great Falls Road. However, as shown in the Noise and Vibration Technical Report Appendix (June 2002), exceedances of the FTA and the WMATA impact criteria are predicted at residences along the triangle bounded by Haycock Road, Westwood Place and Great Falls Road. Mitigation measures have been identified to minimize these impacts and are contained in Section 4.7of the Final EIS. These measures will be refined during preliminary engineering and/or final design.

Question About Parapet for Aerial guideway Section Over I-66 Near West Falls Church

Public Comment: The parapet for the elevated section of track that goes over I-66 near the West Falls Church station is designed to be only 3 feet (light blue color on Figure 5). On either end of that elevated section where the track is lower the parapet is designed to be 5 ft. high. Why is the parapet lower where the track is higher in elevation and sound will spread out more? (0029, 0293-L –1)

Response: *While three to four-foot parapets are proposed along all sections of aerial guideway (except on Airport property), five to six-foot parapets are proposed in areas where exceedances of the FTA impact criteria are predicted. Additionally, higher track elevations do not necessarily equate to more spreading of sound. Higher track elevations, combined with track edge parapets, are predicted to block the line-of-sight of the Metrorail wheel-rail noise and thereby provide more shielding than at grade level.*

Concern Over Adequate Noise Barriers for Neighborhoods Along Dulles Toll Road

Public Comment: Regarding the evaluation of highway noise barrier performance, such analyses should be based upon best-available future traffic projections. From data recently provided by VDOT, 2020 traffic sound levels may be as much as 6-7 dBA greater than those for which the noise barriers around the Hallcrest Heights development originally were designed (considering only the increase in traffic volume - ignoring the presence of any trucks or buses and ignoring any increase in vehicle speeds). (0137, 0224-M –11) (0137, 0176- L-14)

Public Comment: Should such a [noise] barrier be constructed we could support this project. If the Dulles Corridor Rapid Transit Project is unwilling to include this minimal effort to protect the citizens of our neighborhood [West Falls Village], we would regretfully have no choice but to oppose this project by all lawful means at our disposal including the potential for legal action. (0435, 0435-E –5)

Public Comment: Our Association recognizes the potential of this project to increase use of mass transit in Fairfax County and thereby reduce congestion and pollution overall in the County. However, we believe that in accordance with the values of Fairfax County and the Commonwealth of Virginia and in light of the commitment from the Dulles Corridor Rapid Transit Project to work with surrounding communities to mitigate the effects of the project that the project must include measures to ensure that our quality of life and property values are not severely damaged as a result of this project. It is wrong for this project, which has the potential to benefit so many, to be built at the detriment to the few people who live directly next to it. We, therefore, are concerned and dismayed that there are no current plans to build noise barriers as part of this project (Dulles Transit web site FAQ number 19). We believe that this failure is inconsistent with the spirit of continued cooperation with the public that the project claims in the draft Environmental

Impact Statement (DEIS). We also believe that the failure to provide a detailed analysis of both the detrimental health impacts of the noise from increased rail traffic to citizens living near the rail lines without sufficient noise protection and the effect of the noise on property values in those communities is a fatal flaw of the DEIS. (0435, 0435-E –3)

Public Comment: Almost every other similar community along the Dulles Corridor between the Beltway and Dulles Airport has gotten a 25-35 foot high cast concrete noise wall, with the latest absorptive coating…and extending all the way down nearby off-ramps. This is exactly what Maryland has now added along their portion of the Beltway. This is what we insist on being added to our location. From Old Chain Bridge Road along the corridor and all the way down the off-ramp to the merge with Route 123. (0137, 0224-M –6)

Public Comment: We are presently bordered by a low tech, 6-8 foot rotting wooden barrier (see attached pictures) which does not even extend down the off-ramp that wraps around our community. Our engineer tells us that the proposed parapet would set up a "parallel barrier" effect which would magnify, not mitigate, the noise. On page 4-130 of your Draft EIS, there is this pithy sentence: "The effectiveness of the shielding currently provided by the existing berms and barrier walls along the DAAR and Dulles Connector Road would be diminished in those areas where elevated Metrorail tracks are proposed." Our barrier has already been "diminished" by the ten auto accidents that have plowed into it, awaiting non-existent maintenance by VDOT. (0137, 0224-M –5)

Public Comment: Chathams Ford Drive is currently not protected by a sound barrier from the already excessive noise along this very short stretch of the Toll Road. This neighborhood is the only "residential" neighborhood along the Toll Road which has no sound barrier. Moreover, the noise levels are even more severe because road noise "bounces off" the sound barrier on the west-bound Toll Road. (0174, 0300-L –3)

Public Comment: We recommend that an effective sound barrier be built to correct an already intolerable noise situation. There is no justification for making Chathams Ford Drive and Chathams Ford Place the only residential community along the Toll Road to be unprotected from the thunderous noise of the car, bus, and 18-wheeler truck traffic. This issue should have been addressed by the Commonwealth of Virginia and Airport Authority at the time when homes were constructed in the Chathams Ford area. (0174, 0300-L –11)

> ***Response:*** *The Project Team utilized the guidelines established by the (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. The FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas, such as yours, with higher background levels, Project noise limits established by the FTA are more stringent than in quieter areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.*
>
> *There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near the Ronald Regan Washington National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.*

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The locations of the proposed mitigation measures are described in Section 4.7of the Final EIS. Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, roadside sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Public Comment: Hallcrest Heights Association retained the services of a highly experienced and qualified acoustical engineer. His report is attached to this statement, which I hope will be part of your record of decision. My own comments on this subject were submitted earlier at the Scoping session in July 2000 and the Update session in January of 2001. Your March 2001 Alternatives Analysis referenced our concerns, but did not specifically respond to them…nor does your Draft EIS. (0137, 0176-L –4)

Response: *The Project Team received these reports and considered them during the preparation of the Public Scoping Report and preparation of the Draft EIS. In addition, the Project Team has met several times with members of the Hallcrest Heights Association. The comments from your acoustical engineer have been considered as part of the Project planning process.*

Request for Sound Walls at Station and Repair Yards

Public Comment: Additional recommendations: ask for the application of sound walls where appropriate at the station and repair yards where the VDOT traffic noise model (TNM) indicates problems such as Westwood Village where there are potential small increases over the existing background levels. (0287, 0287-T –5)

Response: *Where exceedances of the FTA criteria are predicted, mitigation measures are proposed. Because no roadway changes are predicted as part of the Dulles Corridor Project near Westwood Village, a FHWA noise analysis using the Traffic Noise Model (TNM) was not required at this location.*

Need Improved Concrete Noise Walls for Hallcrest Heights

Public Comment: We are presently bordered by a low-tech, six to eight-foot rotting wooden fence which does not even extend down the offramp that wraps around our community. Our engineer tells us that your proposed parapet would set up a parallel barrier effect which would magnify, not mitigate, the noise. On page 4-130 of the draft EIS, there is this sentence: "The effectiveness of the shielding currently provided by the existing berms and barrier walls along the access road in Dulles connector would be diminished in those areas where elevator metrorail tracks are proposed." Almost every other similar community along the Dulles Corridor between the Beltway and Dulles airport has gotten a 25 to 35-foot high cast concrete noise wall with the latest absorptive coating and extending all the way down the nearby off ramps." This is what we insist on being added to our location. (0137, 0137-T –4)

Public Comment: We [Hallcrest Heights] are presently bordered by a low tech, 6-8 foot rotting wooden barrier (see attached pictures) which does not even extend down the off-ramp that wraps around our community. Our engineer tells us that the proposed parapet would set up a "parallel barrier" effect which would magnify, not mitigate, the noise. On page 4-130 of your Draft EIS, there is this pithy sentence: "The effectiveness of the shielding currently provided by the existing berms and barrier walls along the DAAR and Dulles Connector Road would be diminished in those areas where elevated Metrorail tracks are

proposed." Our barrier has already been "diminished" by the ten auto accidents that have plowed into it, awaiting non-existent maintenance by VDOT. Almost every other similar community along the Dulles Corridor between the Beltway and Dulles Airport has gotten a 25-35 foot high cast concrete noise wall, with the latest absorptive coating…and extending all the way down nearby off-ramps. This is exactly what Maryland has now added along their portion of the Beltway. This is what we insist on being added to our location. From Old Chain Bridge Road along the corridor and all the way down the off-ramp to the merge with Route 123. (0137, 0176-L –6)

Public Comment: In addition, please consider providing cast concrete sound walls for adequate noise abatement in neighborhoods such as Hallcrest Heights, which will be directly affected by the construction and train noise. (0394, 0394-L-3)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995)to determine the applicable noise impact criteria in all areas of the proposed corridor. As described in Section 4.7.2 of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact.*

There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near the Ronald Regan Washington National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

The commenter quotes from the Noise and Vibration Technical Report (June 2002) that the effectiveness of existing barriers would be diminished in areas where elevated Metrorail tracks are proposed. The statement in the Technical Report is intended to indicate that the source of transit noise in the area would be above the existing sound barriers and berms. Trackside parapet barriers are proposed along all sections of aerial Metrorail alignment to mitigate the effects of transit noise on adjacent receptors. Further analysis of the effectiveness of the proposed mitigation will occur during preliminary engineering.

Current Noise Levels in Chathams Ford Drive

Public Comment: According to the FTA (Federal Transit Authority) findings, measurements were taken at one location only along Chathams Ford Drive. The result of these existing noise levels was 63 db at a distance of 481 feet from the center of the Dulles Toll Road. Using the table 4-7.2 -FTA Noise Impact Criteria for Transit Projects, Chathams Ford Drive is already in the Yellow Impact Zone even before the project has started. However, we believe that the situation is already in the Red Severe Impact Zone. (0174, 0300-L –5)

Public Comment: In preparation for this hearing, residents purchased a sound level meter and conducted tests on Chathams Ford Drive at various locations--not just one-- and at various times of the day to measure noise levels. We then compared this information to the findings of the Dulles Task Force, which are included in the Draft Environmental Impact Statement. These comparative results are presented in a table that will be submitted for the written record, but I will summarize them verbally for purposes of this hearing: The average reading was between 70 and 71db for the 4 homes where measurements were taken. This far exceeds the 63db measured at one home by the Task Force. The maximum levels that could be measured by our instrument were 80 db, and we recorded sound at that level at all 4 homes.

These sound levels put Chathams Ford Drive in the severe impact zone even before construction begins or the bus or metro system begins to operate. (0174, 0300-L –7)

Public Comment: According to FTA findings, noise measurements were taken at one residence along Chathams Ford Drive, and the result of these measurements was an average of 60 decibels noise level at a distance of about 481 feet from the center of the Dulles access road. We believe that the situation is already worse than that, and in preparation for the hearing residents purchased a sound level meter and conducted a series of tests, and the full results will be presented in writing before the 28th, but we did it at four different locations at different times during the day. We then compared this information to the findings of the task force which were included in the draft EIS. These comparative results indicate that the average reading, the findings of the EIS were 63 decibels. Our readings were 70 to 71 decibels for the four homes where measurements were taken. This far exceeds the 63 decibels taken. The maximum levels that could be measured by our instrument were 80 decibels, and we did reach that on a number of occasions. (0174, 0174-T –4)

Public Comment: These sound levels put Chathams Ford Drive in the severe impact zone, even before construction activities begin. Thus we recommend an effective sound barrier be built to correct an already intolerable noise situation. There is no justification for making Chathams Ford Drive or Chathams Ford Place the only residential community without a sound barrier. The Commonwealth and the Airport Authority should have addressed this issue when the homes were constructed several years ago. We intend to pursue this issue through the task force and through other means, if necessary. If we have to resort to the use of legal action, it will inevitably delay the Dulles transit project. We are firm in our resolve to have adequate sound protection to ensure the quality of life along the street. (0174, 0174-T –5)

> ***Response:*** *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. As described in Section 4.7 of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas, such as yours, with higher background levels, Project noise limits established by the FTA are more stringent than in quieter areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.*
>
> *Although maximum passby noise levels (or Lmax) from individual vehicles may approach 80 dBA (e.g., such as from heavy-duty trucks), cumulative day-night noise levels (or Ldn) averaged over a 24-hour period are represented by the measured background level of 63 dBA as reported in the Final EIS. This ambient background level is fairly typical of residential land-uses along highway corridors without intervening noise barriers.*

Comments on the June 2002 <u>Dulles Corridor Rapid Transit Project Noise and Vibration Technical Report</u>

Public Comment: I have reviewed the June 2002 Dulles Corridor Rapid Transit Project - Noise and Vibration Technical Report prepared by the Virginia Department of Transportation (VDOT) and the

Washington Metropolitan Area Transit Authority (WMATA). I have two significant concerns regarding the Metrorail alternatives: The introduction of wheel squeal in the vicinity of your development - most significantly - and the performance degradation of the existing highway noise barriers at your development. My specific comments follow:

- § Existing Conditions - The quantification of the existing ambient sound levels apparently was limited to one 24-hr interval on 23 January 2001. While the controlling highway noise source at Hallcrest Heights is likely to be very consistent, substantial variations can occur due to weather conditions. No documentation was given for the weather during the noise survey.
- § Predicted Noise Exposures - At Hallcrest Heights, a 5-dBA range in magnitude was reported for sound levels predicted for the Metrorail Alignment Alternatives (T1, T6, T9 and T4). I was unable to identify the differences in those alternatives that could produce such variation at your development.
- § Expected Wheel Squeal - The Technical Report accurately describes track wheel squeal as "the annoying high-pitched, pure tone noise due to steel wheels rubbing against steel rails" and reports 8-dBA higher overall train sound levels for a curve at National Airport with radius similar to that proposed within 700 ft of Hallcrest Heights. The proposed mitigation, parapet noise barriers, will lower squeal sound levels but will not change their highly annoying tonal character; thus, barriers are unlikely to result in acceptable residential noise exposures. I strongly urge mitigation which eliminates squeal, such as sufficient curve radius or track lubrication.
- § Degraded Highway Barrier Performance - The Technical Report reasonably notes: "The effectiveness of the shielding currently provided by the existing berms and barrier walls along the DAAR and Dulles Connector Road would be diminished in those areas where elevated Metrorail tracks are proposed." The consequence of this is that highway noise will be increased as a result of rail alternatives: therefore, the increased highway traffic sound levels should be included in the computation of the impacts from Metrorail alternatives. There did not appear to be any effort in the Technical Report to quantify the barrier degradation or include it in the impact assessment, or to evaluate mitigation. (0137, 0224-M –10)

Public Comment: Degraded Highway Barrier Performance--The Technical Report reasonably notes: "The effectiveness of the shielding currently provided by the existing berms and barrier walls along the DAAR and Dulles Connector Road would be diminished in those areas where elevated Metrorail tracks are proposed." The consequence of this is that highway noise will be increased as a result of rail alternatives; therefore, the increased highway traffic sound levels should be included in the computation of the impacts from Metrorail alternatives. There did not appear to be any effort in the Technical Report to quantify the barrier degradation or include it in the impact assessment, or to evaluate mitigation. (0137, 0176-L –13)

Public Comment: Expected Wheel Squeal - The Technical Report accurately describes curved-track wheel squeal as "the annoying high-pitched, pure tone noise due to steel wheels rubbing against steel rails" and reports 8-dBA higher overall train sound levels (note that overall sound levels do not assess the highly objectionable tonal character of wheel squeal) for a curve at National Airport with radius similar to that proposed within 700 ft of Hallcrest Heights. The proposed mitigation, parapet noise barriers, will lower squeal sound levels but will not change their highly annoying tonal character; thus, barriers are unlikely to result in acceptable residential noise exposures. I strongly urge mitigation with eliminates squeal, such as sufficient curve radius or track lubrication. (0137, 0176-L –12)

Public Comment: Predicted Noise Exposures--At Hallcrest Heights, a 5-dBA range in magnitude was reported for sound levels predicted for the Metrorail Alignment Alternatives (T1, T6, T9 and T4). I was unable to identify the differences in those alternatives that could produce such variation at your development. (0137, 0176-L –11)

> ***Response:*** *<u>Existing Conditions</u> – Noise measurements were conducted at 30 representative receptor locations to account for the various land use types found along the 23.1-mile Project corridor. Ambient noise measurements representative of your neighborhood were conducted at a residence at 7103 Norwalk Street approximately 1,500 feet to the south. The noise measurement program conducted along the Project corridor was conducted in accordance with good*

engineering practice and the guidelines and standards set forth in the FTA Transit Noise and Vibration Impact Assessment (1995), the ASTM Standard Guide for Measurement of Outdoor A-weighted Sound Levels (1984), and the ANSI Method for the Measurement of Sound Pressure Levels (1981).

As a result, 24-hour continuous noise measurements were conducted at a residence at 7405 Hallcrest Drive beginning Tuesday, January 23, 2001 at 2:43 PM. Based on the field measurement notes, the weather conditions (clear and calm with an ambient temperature of approximately 40°F) were ideal for determining the current background level at this receptor location.

Predicted Noise Exposures – The difference in the predicted day-night noise levels (or Ldn) from Metrorail operations at discrete Receptor R5 (a residence at 7405 Hallcrest Drive, McLean) is due to both alignment and operational changes between alignments. For example, Alignment T9 has a higher operating speed, lower Metrorail track elevation, and lower Metrorail track separation than the other alignments. These factors all combine to result in a higher noise level at receptor R5 under Alignment T9 than for all other alignment options.

Expected Wheel Squeal - There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.

The three to four-foot parapets, proposed as part of the overall track design near the Hallcrest Heights community, will certainly lower wheel squeal sound levels. However, by reducing the overall noise level, the parapets will also, as a result, change the "highly annoying tonal character" of wheel squeal. The dominant observed frequency range of wheel squeal occurs above 2,000 Hertz with wavelengths between 3 and 7 inches. As a result, the parapets are not only expected to effectively reduce the overall noise level, but also eliminate the dominant and most annoying component of the wheel squeal noise spectrum by absorbing the smaller wavelength (i.e., higher frequency) levels. The shielding provided by the parapets is predicted to result in "acceptable residential noise exposures" from the proposed transit operations.

Degraded Highway Barrier Performance – The commenter quotes from the Noise and Vibration Technical Report (June 2002) that the effectiveness of existing barriers would be diminished in areas where elevated Metrorail tracks are proposed. The statement in the Technical Report is intended to indicate that the source of transit noise in the area would be above the existing sound barriers and berms. Trackside parapet barriers are proposed along all sections of aerial Metrorail alignment to mitigate the effects of transit noise on adjacent receptors. Further analysis of the effectiveness of the proposed mitigation will occur during preliminary engineering.

Need Additional Noise Mitigation for the Hallcrest Heights Community

Public Comment: The EIS' Noise and Vibration Technical Report states: "The effectiveness of the shielding currently provided by the existing berms and barrier walls along the DAAR and Dulles Connector Road would be diminished in those areas where elevated Metrorail tracks are proposed." For McLean communities thus affected, such as Hallcrest heights, the EIS should incorporate mitigation measures used for similar corridor communities between the Beltway and Dulles Airport. The mitigation measures proposed in the EIS are actually counter productive according to engineering comment provided to the project team: "the Metrorail facilities impair the ability of existing barrier walls to serve

their design purpose and create new noise impacts in the form of higher road traffic sound levels in addition to the noise produced by the rail operations themselves." There did not appear to be any effort in the Technical Report to quantify barrier degradation or include it in the impact assessment, or to evaluate mitigation. To counter the several varying kinds of noise (vehicular, rail, vibration and wheel squeal), plus the obvious visual problems, the EIS should employ FHWA and VDOT mitigation guidelines as well as those of the FTA. The EIS should consider depressing the tracks in a cut and cover method (similar to the lead track from the Falls Church maintenance yard) as an alternative to elevated flyovers. This was done on Metro's Blue Line at Addison Road, near Centennial Village. (0392, 0392-L –19)

> ***Response:*** *The text in the Draft EIS referenced in the comment refers to aerial structures without parapets (or track edge barriers). Unmitigated aerial structures would be expected to diminish the shielding effectiveness of the existing property line barriers. However, the Build Alternative designs will include three to four-foot track edge barriers, or parapets, along all sections of aerial track including all proposed curved flyovers and tangent track.*
>
> *The Draft EIS and Final EIS identify proposed mitigation in the form of parapet barriers for impacts at receptors adjacent to aerial guideway sections under the Metrorail Build Alternatives. The potential for noise reflections was not assessed as part of the Draft EIS or Final EIS. Acoustically absorptive treatment along the residential side of the structures is an excellent method for eliminating barrier degradation due to the "parallel barrier" effect. Absorptive treatment of the retaining walls leading to the aerial track structure will be investigated further as part of preliminary engineering.*
>
> *There is a potential for wheel squeal noise (caused by the meeting of rails and wheels on a curve) based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, with the three to four-foot parapets, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.*
>
> *Because no exceedances of the FTA impact criteria are predicted under the Metrorail Alternative using parapets along all sections of aerial guideway (except on Airport property), other mitigation measures (such as depressing the tracks in a cut and cover method) are not currently proposed.*

Effectiveness of Proposed Noise Walls

Public Comment: What is the expected barrier effect that will be created from noise walls or fencing? (0147, 0459-L –11)

Public Comment: Plans are to install 3- to 5-foot parapets at tracksides, simply because they have been used before…and not necessarily because they have been proven effective. In fact, Mr. Dittmeier described an unsuccessful attempt to make the parapets "work" by spraying them with a sound-absorbing material. (0432, 0432-E –8)

> ***Response:*** *Three to four-foot parapet barriers are planned for all aerial Metrorail track sections in accordance with WMATA design criteria. Five to six-foot parapets are proposed in areas adjacent to noise receptors that were forecast to exceed FTA noise criteria under Metrorail operations. The recommendation for five to six-foot parapets was based on the projected need for additional noise reductions to bring levels below the FTA impact criteria.*

EIS Map Shows Gaps in Proposed Parapet Installation

Public Comment: Mr. Dittmeier expressed surprise that Figure 5 of the map series shows several gaps in the proposed parapet installation along sections of track where the need for sound mitigation would appear to be beyond question. (0432, 0432-E –9)

> ***Response:*** *The commenter references a figure presented at a coordination meeting conducted for concerned citizens. Figures 4.7-5a and 4.7-5b in the Final EIS illustrate locations where five to six-foot parapets are proposed as additional mitigation over and above the three to four-foot parapets planned for all aerial track under the Metrorail Extension.*
>
> *As currently planned, gaps will not exist in parapets along the aerial sections, however, sections will vary between three to four-foot and five to six-foot parapets depending on the locations of adjacent receptors which are forecast to exceed FTA noise criteria.*

Potential Metrorail Alternative Noise Impacts on the Westhampton Neighborhood

Public Comment: We [Westhampton] recently learned that rapid transit in the Dulles Corridor will subject us to increased traffic congestion and additional noise from the following sources: 8-car trains running every three minutes during rush hour in each direction; an increase in the rail yard capacity; an additional spur from the rail yard into the Dulles Connector Road behind our home; increased cut-through traffic resulting from the new parking garage and increased use of the West Falls Church metro station; the sight of an elevated train passing about 300 feet from our windows every six minutes; placement of steel beams (at night), which we understand are good transmitters of sound, to carry trains over I-66. While the projections of the Environmental Impact Statement indicate that passing trains along the Dulles Corridor will produce significant additional noise, we have no information on the combined impact of all of the new noise sources listed above. We also do not know what the overall ambient noise level will be when the new sources of noise are combined with the existing noise level. Furthermore, we are concerned that the projections of the Environmental Impact Statement will soon prove to be far too low as use of the new metro and the Dulles Connector Road increases over time. (0403, 0404- L- 3)

Public Comment: We have lived in this [Westhampton] community for 15 years. Some of our neighbors are new residents while others are the original owners of homes that are more than 40 years old. We enjoy the conveniences of living in the inner suburbs. We use metro on a daily basis. However, we feel that placing rapid transit in the median of the Dulles Connector Road will raise the noise level in this neighborhood to an unacceptable level and make our streets unsafe for our children, resulting in a dramatic decline in the quality of life we experience. For all of these reasons, we feel that traffic amelioration and a sound barrier behind our home, along the Dulles Connector Road, gives us the best chance to maintain our quality of life. (0403, 0404- L-4)

Public Comment: Having lived in the Westhampton neighborhood on Greenwich Street for more than twelve years, I can tell you first hand that the noise levels and traffic have risen significantly at the interchange where the Dulles Access Road connects with I-66 at the West Falls Church Metro Station - particularly, since the addition of the Dulles Toll Road traffic. The two levels of traffic already create such significant noise for our neighborhood that noise abatement structures are warranted today, even before the Transit Project was to commence. (0414, 0414-L –1)

Public Comment: Figure 3 in the map series shows that the Westhampton area next to the right of way and between what appears to be 745+00 and 785+00 will be below track level. There seemed to be no understanding of sound transmission…that is…whether track noise will be greater for residents above or below track level…or whether the tunnel exit from the West Falls Church Storage and Inspection yard might concentrate and "focus" noise at residential areas in line with the exit. (0432, 0432-E –10)

Public Comment: Here again [Westhampton], it would seem that concrete walls are the appropriate solution to noise pollution as well as to visual pollution. (0432, 0432-E-13)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995)) to determine the applicable noise impact criteria in all areas of the proposed corridor. As described in Section 4.7 of the Final EIS, the FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact.*

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Need to Mitigate Switch Noise

Public Comment: The problem of switch noise which occurs when a steel wheel bridges and bumps across the gap between rail ends is inevitable, so is wheel squeal on tight turns like the one into the WFC S&I Yard. Surely something can be done to muffle and mitigate this problem. (0432, 0432-E –12)

Response: *Although the proposed Metrorail Extension consists of continuously welded rail (CWR) track, switches are proposed at several locations along the Dulles Corridor. Based on noise measurements conducted at Discrete Receptor R1 (The Pavilion townhouses on Falls Church Drive) along the existing Orange Line near West Falls Church station, Metrorail passbys over single switches or crossovers will be audible; but are not expected to lead to an exceedance of the Project noise criteria.*

Wheel squeal was included in the noise analysis for tight radius turns such as the one at the West Falls Church S&I Yard site. The Final EIS includes mitigation measures (see Section 4.7) to enclose a portion of the existing loop track and the proposed yard lead in box structures to reduce noise impacts.

Deficiencies in the Proposed Noise Mitigation Strategies

Public Comment: Deficiencies in the proposed noise mitigation strategy. The proposed noise mitigation strategy is using short walls close to the track to sound-proof the train wheels. The plans show gaps in the sound-proofing walls at the section of track along the Westhampton neighborhood. There is no data to demonstrate that the proposed mitigation strategy (i.e., sound-proofing walls) will be effective in maintaining the noise below federal standards if peak cumulative noise levels are considered and for this particular (and unique) situation, i.e., high speed rail in close proximity to homes on sharply curved aerial track on metal supports. (0386, 0386-E –3) (0398, 0398-L-3) (0399 0399-L-3) (0412, 0412-L-3) (0415, 0415-L-3) (0416, 0416-L-3) (0430, 0430-E-3) (0466, 0466-L-3) (0467, 0467-L-3) (0431, 0431-E-3) (0473, 0473-L-3) (0469, 0469-L-3) (0471, 0471-L-3) (0465, 0465-L-3) (0470, 0470-L-3) (0438, 0438-E-3) (0442, 0442-L-3) (0474, 0474-L-3)

Public Comment: Deficiencies in the proposed noise mitigation strategies. The proposed noise mitigation strategy is using short walls close to the track to sound-proof the train wheels. The plans show gaps in the sound-proofing walls at the section of track along the Westhampton neighborhood. There is

also no data to quantify the final derivative noise output after mitigation and no data to demonstrate that the proposed mitigation strategy (i.e., sound-proofing walls) will be effective in maintaining the noise below federal standards. Plans also appear to be insufficient to address the other additional noise sources from switches and the rail yard. (0403, 0403-L –2)

Response: *The Metrorail Extension at the junction with the existing Orange Line in West Falls Church is expected to have a gradual curve with a turning radius of 1,000 feet. Based on the FTA guidelines as well as measurements made at other existing Metrorail curves, wheel squeal is not expected to occur at locations with this curvature. Tangential noise that typically occurs along straight sections of track is expected along this segment of the Dulles Corridor.*

Due to structural vibrations, aerial track may exhibit additional structural noise as a result of train passbys along aerial guideway sections. Although the potential for additional structural noise was included in the noise assessment, it is highly unlikely due to the newer structural designs proposed along the Dulles Corridor. Pre-cast concrete supports, resiliently-supported ties, and continuously welded rail (CWR) track included in the proposed track design all combine to greatly minimize overall noise and vibration levels from train passbys along aerial sections.

Additionally, three to four-foot parapets (or track edge barriers) are proposed as part of the design along all aerial sections of the Metrorail Extension. Based on the assumed Metrorail source height of two feet above rail combined with the top-of-rail elevation, the three to four-foot parapet height is predicted to effectively shield train passbys at nearby residences. As a result, aerial tunnels in the sky are not required. For example, based on a profile view of the 2-foot train source height with and intervening three to four-foot parapet wall on an elevated structure above a five-foot receptor, the line-of-sight between the train and the receptor is broken by the parapet. The degree of this path length difference (i.e., between the direct line-of-sight and the path over the parapet) relates to the overall shielding effect of the barrier.

Acoustically absorptive treatment along the trackside of the parapets further improves the shielding benefits of the structural parapets. The 2-foot train source height is a combination of the steel wheel on steel rail noise, the aerodynamic noise, as well as other onboard auxiliary equipment such as brake and air conditioning compressors.

As described in Section 4.7 of the Final EIS, the noise analysis was conducted according to the FTA Transit Noise and Vibration Impact Assessment (1995) guidelines. Accordingly, the peak-hour equivalent noise level (or Leq) was used to evaluate impacts at non-residential receptors; and the 24-hour day-night noise level (or Ldn) was used to evaluate impacts at residential receptors. Although the FTA criteria are defined in terms of allowable project exposure, the basis for the FTA criteria is actually the increase in the cumulative noise (i.e., when the Project levels are added to the existing noise).

In addition to the FTA cumulative noise criteria, peak or maximum noise levels (or Lmax) from transit operations were also used to evaluate Project impacts using the WMATA Design Criteria for various residential land-uses. The Lmax noise level is independent of the existing background and the number of operations and represents the maximum level observed during a single event, such as a Metrorail or bus passby.

Finally, Figures 4.7-5a and 4.7-5b in the Final EIS show the proposed locations of five to six-foot parapets (or track edge barriers) along both aerial and at-grade sections of track that were proposed to eliminate noise impacts predicted under the Metrorail Alternative. All other sections of aerial track, including the flyover near I-66 and in Tysons Corner, for example, include three to four-foot parapets as part of the proposed track design. If no exceedances of the FTA or the WMATA impact criteria are predicted along other at-grade sections of track under the Metrorail Extension (such as along the Westhampton neighborhood), no additional mitigation measures are proposed.

Quantify Noise Output After Mitigation Measures

Public Comment: Additional study of the noise impact at peak cumulative noise levels on the surrounding communities, including: 1) precisely quantifying the expected peak noise output after mitigation features, including a consideration of cumulative affects from the enlarged rail yard, its tunnel and curved feeder tracks, the highway, and the metal train track support; and 2) examining and documenting the effectiveness of the proposed mitigation strategy (i.e., sound-proofing walls) for mitigating peak cumulative noise levels. (0386, 0386-E –6) (0471, 0471-L-5) (0399, 0399 L-6) (0412, 0412-L-6) (0415, 0415-L-6) (0416, 0416-L-6) (0430, 0430-E-6) (0431, 0431-E-6) (0466, 0466-L-5) (0473, 0473-L-6) (0474, 0474-L-6) (0465, 0465-L-6) (0469, 0469-L-5) (0438, 0438-E-5) (0398, 0398-L-6) (0470, 0470-L-6) (0467, 0467-L-5) (0442, 0442-L-5)

Public Comment: Additional study of the noise impact on the neighborhood [Westhampton] to: 1) precisely quantify the expected noise output after mitigation features, including a consideration of how the rail yard tunnel might exacerbate noise levels; 2) support the contention that the proposed mitigation strategy (I.e., sound-proofing walls) will be effective; and 3) consider the probable total noise level by combining the current level with all new sources of Metro-related noise. (0403, 0403-L –5)

Response: *With respect to the concerns of communities on the noise of the Metrorail West Falls Church Yard, the Project Team recommended and the decision-makers approved the enclosure of 1) a portion of the existing loop track at the yard's eastern end and 2) the new yard lead in box structures. These noise mitigation measures by the Project will reduce the wheel squeal noise of the train movements within the Yard. The Project Team notes, however, that new residences have been recently constructed and occupied adjacent to the West Falls Church S&I Yard without any noise mitigation provided by the residential developer. As during the past ten-year effort to address yard noise, there will be coordination among DRPT, WMATA, Fairfax County officials and staff, and representatives of the communities during preliminary engineering and final design.*

The number of additional cars at West Falls Church Yard has increased from 26 in the Draft EIS to 42 in the Supplemental Draft EIS and Final EIS in order to support the Metrorail fleet of the Wiehle Avenue Extension.

Wheel squeal from the new yard lead (for Metrorail trains to and from the Dulles Corridor Line) at the east end of the yard was included in the modeling analysis. Based on measured noise levels from the current wheel squeal along a similar radius curve at the yard, exceedances of the FTA impact criteria are predicted at nearby residences. No exceedances are predicted from the Project's aerial guideway in the median of the Dulles Connector Road.

Other noise sources, such as train horns, were not included in the modeling analysis. Brake squeal was not determined to be a major problem. Based on the current operating schedule at the yard, the increase in the overall yard noise due to the cleaning and general operation of 42 additional Metrorail cars needed for the Project is expected to be minimal.

No noise impacts are predicted at nearby residences from the new rail yard tunnel portal in the median of the Dulles Airport Connector Road. This is due to several reasons including the location of the curve deep inside the tunnel, the use of acoustical treatments along the tunnel walls, and the directionality of the tunnel portal and the nearby residences.

As described in Section 4.7 of the Final EIS, the noise analysis was conducted according to the FTA Transit Noise and Vibration Impact Assessment (1995) guidelines. Accordingly, the peak-hour equivalent noise level (or Leq) was used to evaluate impacts at non-residential receptors; and the 24-hour day-night noise level (or Ldn) was used to evaluate impacts at residential receptors. Although the FTA criteria are defined in terms of allowable project exposure, the basis for the FTA criteria is actually the increase in the cumulative noise (i.e., when the project levels are added to the existing noise).

In addition to the FTA cumulative noise criteria, peak or maximum noise levels (or Lmax) from transit operations were also used to evaluate Project impacts using the WMATA Design Criteria for various residential land-uses. The Lmax noise level is independent of the existing background and the number of operations and represents the maximum level observed during a single event, such as a Metrorail or bus passby.

Furthermore, although newer pre-cast concrete track structures are proposed to minimize excessive noise and vibration levels, the modeling analysis included a 4-decibel penalty to account for potential structural noise due to Metrorail passbys along all elevated sections of slab track. As described in Section 4.7 of the Final EIS, where exceedances of the FTA or the WMATA impact criteria are predicted, mitigation measures are proposed. All proposed mitigation measures are predicted to eliminate exceedances of the FTA (cumulative) and the WMATA (peak) impact criteria. Quantification of the anticipated noise reductions associated with proposed noise mitigation will occur during preliminary engineering or the final design.

Comparison of Noise Levels of an Aerial Bridge Versus a Tunnel

Public Comment: Has any noise analysis been done to compare the sound impact on my house and my neighbors of an aerial bridge versus a tunnel? I am not an engineer, but it strikes me that elevating a train to a level equal to the height of the sound barriers gives the sound a more direct angle to our houses. Will better and higher barrier walls need to built to protect our houses and their values? (0117, 0117-E –7)

Response: *Noise measurements and analyses were originally conducted at 30 discrete noise-sensitive receptor locations along the corridor during the peak travel, mid-day, off-peak, and late night hours. After the selection of the LPA, the total number of receptors measured in the Final EIS was 21. See Section 4.7 of the Final EIS for specific monitoring locations.*

Under the Metrorail Extension, which is the selected Locally Preferred Alternative, three to four-foot parapets (or track edge barriers) are proposed along all aerial sections of the alignments. Based on the assumed Metrorail source height of two feet above rail combined with the top-of-rail elevation, the three to four-foot parapet height is predicted to effectively shield train passbys at nearby residences. Additionally, acoustically absorptive treatment along the trackside of the parapets could further improve the shielding benefits of the structural parapets.

Noise Impacts on Homes Located Near Dulles Airport Access Road and West Falls Church Metrorail Station

Public Comment: I sent this email to you on 7-15-02: I live at 2050 Greenwich Street. My house backs up to the Dulles Access Road several blocks after the Dulles Access Road branches off of I-66. How much noise will the train add to my backyard? Although there is a 20 (approx.) foot barrier fence, we already get some sound from cars on the access road. Will having the train as my neighbor increase the noise and by how much? (0117, 0117-E –5)

Public Comment: I was shocked to learn at the hearing last night at Springhill Elementary School that you are planning to take the train into the air near the West Falls Church Metro. I had always assumed that you would make the turn underground. What additional sounds will be generated for the homes and high occupancy condos on both sides of 66 and the Dulles Access Road around the WFC metro? (0117, 0117-E –1)

Response: *Due to structural vibrations, aerial track may exhibit additional structural noise as a result of train passbys along aerial guideway sections. Although the potential for additional structural noise was included in the noise assessment, it is highly unlikely due to the newer structural designs proposed along the Dulles Corridor. Pre-cast concrete supports, resiliently-supported ties, and continuously welded rail (CWR) track included in the proposed track design all combine to greatly minimize overall noise and vibration levels from train passbys along aerial*

sections. Additionally, three to four-foot parapets are proposed as part of the design along all sections of aerial guideway (except on Airport property) to further reduce train noise at nearby receptors.

The Metrorail Extension at the junction with the existing Orange Line in West Falls Church is expected to have a gradual curve with a turning radius of 1,000 feet. Based on the FTA guidelines as well as measurements made at other existing Metrorail curves, wheel squeal is not expected to occur at locations with this curvature. Tangential noise that typically occurs along straight sections of track is expected along this segment of the Dulles Corridor.

Estimated Ldn noise levels from Metrorail operations along Greenwich Street are predicted to range from 55 to 59 dBA. These levels are well below the measured background of 62 to 65 dBA. Based on current traffic levels, the ambient noise level in 2025 with Metrorail service would increase approximately 1 decibel to range from 63 to 66 dBA. As a result, no exceedances of the FTA noise criteria are predicted from Metrorail passbys at receptors along the Greenwich Street neighborhood.

Metrorail Extension will Create Noise in Neighborhoods

Public Comment: I am not an environmental sound specialist, but I ride the train a lot and it seems to me this means you are planning to put a lot of noise in my neighborhood. Putting loud rapidly moving and turning trains in direct earshot of lots of people's residences seems very inconsiderate. How about our property values? Specifically, how much new noise will be created and how frequently? (0117, 0117-E – 3)

Response: *The Metrorail Extension at the junction with the existing Orange Line in West Falls Church is expected to have a gradual curve with a turning radius of 1,000 feet. Based on the FTA guidelines as well as measurements made at other existing Metrorail curves, wheel squeal is not expected to occur at locations with this curvature. Tangential noise that typically occurs along straight sections of track is expected along this segment of the Dulles Corridor.*

Estimated Ldn noise levels from Metrorail operations along Greenwich Street are predicted to range from 55 to 59 dBA. These levels are well below the measured background of 62 to 65 dBA. Based on current traffic levels, the ambient noise level in 2025 with Metrorail service would increase approximately 1 decibel to range from 63 to 66 dBA. As a result, no exceedances of the FTA noise criteria are predicted from Metrorail passbys at receptors along the Greenwich Street neighborhood.

Studies on the impacts of transit systems have found that the availability of transit typically increases the value of property in the vicinity.

Impacts of Night-Time Construction Noise

Public Comment: Another frightening aspect of your study is the statement that heavy rail construction at the Orange Line Dulles connection would take place at night. The only impact I could find was the suggestion that fewer travelers would be inconvenienced. What about those of us who must sleep at night in surrounding neighborhoods? Will you address the health impacts of long-term of Ambien? (0145, 0145-T –9)

Public Comment: The first point is that the construction activities along the Toll Road will aggravate a serious noise situation especially because the buses and metrorail are major contributors to noise and will operate until midnight during the week and 2 a.m. on the weekends. (0174, 0174-T –3)

Response: *During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified*

in local noise ordinances. If necessary, temporary mitigation measures will be employed during construction.

A study of the health impacts of long-term use of Ambien (a prescription drug that is used as a sleeping aid) is beyond the scope of the EIS.

Metrorail Extension Noise Impacts on Rotonda Community

Public Comment: Added to the cost would be the loss in quality of life to the Rotonda residents. Though my condo is located so I'd experience little additional noise, numbers of residents would experience so much they would find it intolerable. (0051, 0051-CC-2)

Public Comment: As residents of the Rotonda we object to the above ground Metrorail (T-4 loop) which would border our properties as the appearance, noise and vibrations would be offensive. (0037, 0309-L –1) (0310, 0310-L –1) (0311, 0311-L –1) (0312, 0312-L –1) (0313, 0313-L –1) (0314, 0314-L –1) (0315, 0315-L –1) (0316, 0316-L –1) (0317, 0317-L –1) (0318, 0318-L –1) (0319, 0319-L –1) (0320, 0320-L –1) (0321, 0321-L –1) (0322, 0322-L –1) (0323, 0323- L-1) (0324, 0324-L –1) (0325, 0325-L –1) (0326, 0326-L –1) (0327, 0327-L –1) (0328, 0328-L –1) (0329, 0329-L –1) (0330, 0330-L –1) (0331, 0331-L –1) (0332, 0332-L –1) (0333, 0333-L –1) (0334, 0334-L –1) (0335, 0335-L –1) (0336, 0336-L –1) (0337, 0337-L –1) (0338, 0338-L –1) (0339, 0339-L –1) (0340, 0340-L –1) (0341, 0341-L –1) (0342, 0342-L –1) (0343, 0343-L –1) (0344, 0344-L –1) (0345, 0345-L –1) (0346, 0346-L –1) (0347, 0347-L –1) (0348, 0348-L –1) (0349, 0349-L –1) (0350, 0350-L –1) (0351, 0351-L –1) (0352, 0352-L –1) (0353, 0353-L –1) (0354, 0354-L –1) (0355, 0355-L –1) (0356, 0356-L –1) (0357, 0357-L –1) (0358, 0358-L –1) (0359, 0359-L –1) (0360, 0360-L –1) (0059, 0361-L –1) (0362, 0362-L –1) (0363, 0363-L –1) (0364, 0364-L –1) (0365, 0365-L –1) (0366, 0366-L –1) (0367, 0367-L –1) (0368, 0368-L –1) (0369, 0369-L –1) (0370, 0370-L –1) (0371, 0371-L –1) (0372, 0372-L –1) (0373, 0373-L –1) (0374, 0374-L –1) (0375, 0375-L –1) (0376, 0376-L –1) (0377, 0377-L –1) (0378, 0378-L –1) (0379, 0379-L –1) (0380, 0380-L –1) (0302, 0302-L –1) (0305, 0305-L –1)

Response: *These comments concerned the potential effects of Alignment T4, which was eliminated from further consideration after the public and agency review and comment on the Draft EIS. No noise impact is projected in the vicinity of the Rotonda.*

Additional Noise is Hazardous to Children

Public Comment: Finally, the excessive noise is a health and safety hazard for children who because of the noise cannot hear oncoming cars. This hazard affects both children and adults whether they walk on the shoulders of the street or on the street itself. (0174, 0300-L –10)

Response: *The FTA criteria allow the ambient noise levels to increase 1 to 3 decibels (depending on the current background level). The ambient noise level currently experienced by this neighborhood is from traffic on I-66 and the Dulles Connector Road. This existing ambient noise level is not anticipated to be significantly increased by the Project. Under the Metrorail Extension, which is the LPA, Project noise levels are predicted to increase the ambient level by less than 2 decibels. As described in Section 4.7 of the Final EIS, where exceedances of the FTA criteria are predicted, mitigation measures are propose.*

Buses are a Major Contributor to Noise

Public Comment: Thus, the deployment of the bus, metro or combination system would only increase an already serious noise problem. And because buses are a major contributor to noise, the level of increase will not be tolerable. (0174, 0300-L –6)

Response: *Based on the FTA impact criteria, Project noise levels are allowed to increase the ambient background levels only slightly (i.e., 1-3 decibels) or not at all based on the decibel level*

measured as the existing ambient condition. Where exceedances of the FTA criteria are predicted, mitigation measures are proposed. (See Section 4.7.7 of the Final EIS)

Support Metrorail Extension but Concerned Over Noise Impacts

Public Comment: I support rail along the Dulles Corridor. However, the draft environmental impact statement has left me with concern as to the implementation. As with other individuals, I am worried about the impact on residential neighborhoods of heavy rail-generated noise, particularly from the elevated track. (0178, 0178-T –1)

Response: *Rail generated noise was assessed according to FTA guidelines and the results of the analysis are presented in Section 4.7 of the Final EIS. In areas where the Metrorail Extension would have aerial guideway, three to four-foot parapet barriers are planned on the structure. These barriers would result in a reduction of noise from the wheel/rail interaction. Where the noise analysis identified the potential for exceedance of the FTA noise criteria at adjacent receptors, mitigation was considered to minimize impacts. Five to six-foot parapet barriers have been proposed in some locations in order to reduce impacts below FTA criteria. The locations where five to six-foot parapets are proposed are illustrated on Figures 4.7-5a and 4.7-5b of the Final EIS.*

Aerial Structures Should Be Required To Be Concrete

Public Comment: Aerial Structures -- WMATA should be required to make a commitment during its approval process (included in the resolution the Board of Directors adopts to approve the Dulles Line) to require that the aerial structures be concrete. Concrete structures are the basis of the noise analysis. The option, a composite steel and concrete structure with a concrete deck atop a steel box beam as used in the vicinity of the Eisenhower Avenue and Huntington Stations and outbound of the Stadium-Armory Station. These composite structures are inherently much noisier and thus, unacceptable. The commitment in the resolution is necessary to preclude WMATA from shifting from the concrete to the composite structure during the design phase despite promises to the community as occurred on the Blue Line Extension in Prince George's County where a composite structure was substituted for the promised concrete structure for the structure crossing the Beltway. (0387, 0387-L –12)

Response: *Although newer pre-cast concrete track structures are proposed to minimize excessive noise and vibration levels, the modeling analysis included a 4-decibel penalty to account for potential structural noise due to Metrorail passbys along all elevated sections of slab track. This noise assessment is based on the FTA guidelines and is independent of the type of aerial structure proposed as part of the Dulles Corridor Rapid Transit Project.*

Need Cast Concrete Sound Barrier Walls for Hallcrest Heights

Public Comment: The project needs to include additional measures to provide adequate noise mitigation to the affected neighborhoods, particularly those of Hallcrest Heights, at the time of construction. The measures proposed in the DRAFT EIS are insufficient. Cast concrete walls with sound absorptive coating would be more likely to provide adequate mitigation. (0418, 0418-L –3)

Response: *Exceedances of the WMATA noise criteria for construction activities were identified in Section 4.7 of the Final EIS. During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures will be employed during construction.*

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS.

Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Increased Train Traffic Will Increase Noise Impacts on West Falls Village Community

Public Comment: Clearly the construction and operation of a new rail line to Dulles Airport will result in increased use of the tracks that run by our community [West Falls Village]. The level of train traffic could be substantial, resulting in as much as a doubling of the train traffic on the current Orange Line tracks. In fact, if a line is built which includes train service to Tysons Corner, we can easily foresee a future in which the increased demands for service to Tysons results in more than a doubling of train traffic. Any increase in train traffic represents a major noise increase and is of great concern to our community. Currently, even in periods of peak car traffic noise, a train moving by our neighborhood results in a significant, noticeable and unpleasant increase in noise levels. The threat of a significant increase in train traffic would be a major impact on our community negatively affecting our health and well being. In addition, we also are threatened by the noise resulting from the substantial construction needed for this project. (0435, 0435-E –2)

Response: *The impacts associated with the Dulles Corridor Rapid Transit Project are identified in Section 4.7 of the Final EIS and include the number of proposed future transit operations. Based on the noise modeling assessment using the FTA Transit Noise and Vibration Impact Assessment (1995) guidelines, no exceedances of the FTA impact criteria are predicted at the West Falls Village community. Therefore, although no mitigation is proposed specifically for the West Falls Village community, this area should benefit from mitigation measures to eliminate impacts predicted along Haycock Road and Westwood Place.*

Additional Mitigation of Construction-Related Noise Impacts on Hallcrest Heights

Public Comment: Additional measures to provide adequate noise abatement in neighborhoods that will be affected by construction, such as Hallcrest Heights, must be included in the project. (0393, 0393-L –4)

Response: *Exceedances of the WMATA criteria for construction activities are identified in Section 4.7 of the Final EIS. During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures would be employed.*

Metrorail Extension May Reduce Bus and Vehicle Noise

Public Comment: I live adjacent to the Dulles Access Rd. as it approaches "66" - and I am intimately acquainted with the problems of noise especially. Maybe rapid transit will cut down bus and vehicle noise - a thought - but it can't be worse than it already is. (0467, 0467-L –10)

Response: *Thank you for your comment.*

Monetary Compensation for Noise Impacts

Public Comment: What about monetary compensation for reduced quality of life? With the noise level, we will only be able to sleep between 2:00 AM - 5 AM. Property values will be drastically reduced! (0058, 0058-CC-1)

Response: *Noise impacts are assessed in Section 4.7 of the Final EIS. Mitigation measures are proposed to minimize impacts. In general, property values along transit corridors, and especially near transit stations, increase over time due to the benefits of improved mobility.*

Aggressively Address Noise Impacts on Homes Near Greenwich Street

Public Comment: Additional noise generated from construction and metro operations needs to be aggressively addressed. Partial track enclosure or 5 foot track parapet should be considered [near Greenwich Street]. In addition, there should be limits on construction noise during the overnight hours while the project is underway. (0389, 0389-E –4)

Response: *Three to four-foot parapets (or track edge barriers) are proposed along all aerial Metrorail sections (except on Airport property). The types and location of the proposed mitigation measures are described in Section 4.7of the Final EIS. Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.*

During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures will be employed during construction.

Need to Reduce Construction Noise Through Sequencing

Public Comment: Although specifics are not given in the EIS, it is not hard to judge from precedents in other elevated sections of the Metro system, that construction noise will be considerable. Since our community [Hallcrest Heights] lies some 10-12 feet below the level of the roadway in the corridor, the construction of the elevated and curving section of the proposed rail service into Tysons, will involve substantial and sustained construction noise over an extended period of time. Given the FTA's policy of coordinated transportation planning (which I assume would include dealing with such public agencies as MWAA and VDOT), the EIS should sequence significant transportation noise mitigation measures in the corridor (and particularly our adjoining section) ahead of construction activities. Since VDOT has chosen not only to not maintain the existing ineffective barrier, (which is too low and too short anyway), and since MWAA has said they will not retrofit any communities for such abatement, the EIS should address the problem in a comprehensive way if the project's objective to protect adjoining communities has any meaning at all. If the EIS were to include such analysis, then a noise barrier of modern design equivalent to that erected for Wolf Trap and other communities in the corridor should be placed at our section of the corridor. Such a barrier must extend all the way down the off-ramp to the merge with Route 123 if it is to have any effect at all. (0137, 0304-L –3)

Response: *Exceedances of the WMATA noise criteria for construction activities are identified in Section 4.7 of the Final EIS. During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time of day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures will be employed.*

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The types and location of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to

make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Concern Over Nighttime Construction Activities

Public Comment: Another frightening aspect of your study is the statement that heavy rail construction at the Orange Line/Dulles connection would take place at night! The only impact I could find was the suggestion that fewer travelers would be inconvenienced. What about those of us who must sleep at night in the surrounding neighborhoods? (0145, 0452-E –6)

Response: *The short-term construction effects and noise generated by that construction were included in the noise analysis and any adverse effects on neighborhoods were identified. Certain construction work must be completed during Metrorail non-revenue hours.*

Concrete Aerial Structures Are Better Than Composite Steel Beam

Public Comment: Design of aerial structures is critical. Aesthetics and acoustical impacts should not be objectionable to pedestrians or nearby residents. Concrete structures are quieter and more flexible than composite steel beam structures with the concrete deck, as has been used near the Grosvenor-Stadium Armory and Huntington stations. Designers should strive to provide the quietest environment possible. (0387 4-01)

Response: *The materials used to construct the aerial structures will be finalized during preliminary engineering.*

Noise Impacts on Westhampton Neighborhood

Public Comment: Believes that the Westhampton neighborhood is subject to disproportionate share of impacts of noise, traffic, air, and visual pollution. States that nowhere else on the Metrorail system are a park-and-ride facility, freeway (Dulles Connector Road), rail yard, and an aerial track simultaneously located near residences. (0117, 4-02)

Public Comment: Believes that the Westhampton neighborhood is subject to disproportionate share of impacts of noise, traffic, air, and visual pollution. States that nowhere else on the Metrorail system are a park-and-ride facility, freeway (Dulles Connector Road), rail yard, and an aerial track simultaneously located near residences. (0388, 4-03)

Public Comment: States that the Westhampton neighborhood is the starting point for the project, so how will they not be affected by noise, traffic, air, and visual impacts of the project, as stated in the Draft EIS and *Public Hearings Report*. (0520, 4-01)

Response: *The Project Team is aware of Westhampton's concerns. The Project Team will continue to coordinate with the neighborhood and Fairfax County on these issues during preliminary engineering.*

Public Comment: Requests that the Project Team adopt a more aggressive mitigation strategy such as an underground track bed in the area near the West Falls Church Metrorail Station and rail yard. (0117, 4-03)

Response: *The planning for the Orange Line Junction of the Metrorail Extension has always incorporated the use of at-grade and aerial methods of construction for connecting the flyover from the median of I-66 to the median of the Dulles Connector Road. Provisions for this connection were made with the original construction of the Orange Line in the early 1980s, including the construction of a pier and foundation in between the Orange Line tracks to facilitate such an aerial structure to minimize eventual disruption to the Orange Line during construction.*

The impacts and costs for underground construction of this connection were not evaluated as part of any current alternative. Making this connection would present extremely complex construction challenges to keep the Orange Line fully operational and not impact both directions of I-66, a major interstate highway. Due to its complexity, the cost of this underground construction for this segment would be significantly greater than typical cut and cover construction, and many times greater than the planned at-grade and aerial construction.

Public Comment: Encourages the Project Team to visit the neighborhood and perform acoustical readings when the trains are actively entering and existing the West Falls Church S&I Yard. Suggests that if the Project Team cannot find a way to mitigate or lessen the noise, then the design of the rail yard should be modified before construction of the Dulles Line begins. States that residents are not against the project, but they are against the increased noise. The Project Team needs to start a dialogue with the neighbors of the West Falls Church rail yard. (0089, 4-02)

Response: *The Project Team is aware these concerns. As mitigation for the potential noise impacts, it is proposed that the new lead track and portions of the existing loop track at the West Falls Church Yard be fully enclosed to reduce wheel squeal noise impacts from yard operations.*

Use of Lubricants to Address Wheel Squeal

Public Comment: Concerned that the mitigation measures proposed for wheel squeal (on page 220 of the *Public Hearings Report*) will never get implemented. Commenter inquired with a Metrorail engineer and was told that lubricants are only used on tracks when there are complaints from neighbors. (0137, 4-02)

Response: *The use of lubricants is one of the measures identified in the Draft EIS as possible mitigation for train wheel squeal. In addition is proposed that the new lead track and portions of the existing loop track at the West Falls Church Yard be enclosed to reduce wheel squeal noise impacts from yard operations.*

Cutting Down Trees for Stormwater Pond Will Increase Noise Impacts

Public Comment: Concerned that the noise is presently so severe that it is a public safety hazard that will be made worse by the construction of Metrorail without the construction of sound walls between the Dulles Toll Road and their neighborhood. Concerned that noise levels are currently above FTA accepted limits, and the commenters feel that if the current mature forestation is torn down for the construction of a stormwater pond, then WMATA is directly responsible for the resulting noise impacts. Commenters recommend the development of a noise abatement plan between WMATA, VDOT, and affected individuals. (0383, 4-01)

Response: *The proposed pond location in question currently is a natural depression with a culvert outfall. If a pond were constructed in this location, little or no grading would be required to convert existing depression into a stormwater management facility. It is unlikely that many of the trees would need to be removed. A discussion of the Project's noise effects and proposed mitigation measures is presented in Section 4.7 of the Final EIS.*

Project Will Add to Existing Noise

Public Comment: The project will exacerbate existing noise and traffic problems. (0430 4-01) (0388, 4-01)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995)to determine the applicable noise impact criteria in all areas of the proposed corridor. The FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to*

evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact. Section 4.7of the Final EIS contains proposed mitigation measures for predicted noise impacts.

Concern over Existing and Proposed Noise Mitigation

Public Comment: Inadequate noise mitigation- unconvinced of the effectiveness of the parapet walls for aerial track. Existing walls are too short, ineffective, and have not been maintained by VDOT. No sound wall exists between the DAAR and some of the residences in the community. (0388, 4-02) (0430, 4-02)

Response: *The Project is not responsible for the mitigation of existing noise issues. Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The types and location of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b in the Draft EIS are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.*

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Noise Impacts at West Falls Church

Public Comment; Increased noise volume, frequency, and duration from additional trains at the West Falls Church Service and Inspection (S&I) Yard. (0483, 4-04) (0501, 4-01), (0499, 4-01), (0500, 4-01)

Public Comment: Concerned that the noise impacts will be louder than expected since the new Metrorail line will shoot up out of the West Falls Church Station, and since accelerating up hill will take more power, thereby creating more noise. The Project Team stated that the only impact will be wheel squeal noise. (0520, 4-02)

Public Comment: Suggests that the Project Team needs to conduct a neighborhood study around McKay, Eastman, Norwalk, and Idylwood Streets. States that the high-pitched wheel squeal from trains sounded like a piece of chalk or fingernails scraping a blackboard. The noise levels are intolerable. (0089, 4-01)

Public Comment: And be it further resolved that, with the increase in storage tracks in the West Falls Church S&I Yard from the 26 storage tracks proposed previously to 42 to accommodate the lack of storage at Dulles during the first phase, and given increased maintenance operations, and given the conjunction of this yard with aerial rail track and a ninety-degree turn near residences as well as a new multi-story parking structure at the West Falls Church station, there is an increased need to take strong efforts to mitigate noise that impacts the surrounding residential neighborhoods and analyze traffic effects. (0034 0035-3)

Public Comment: They may point out that there is a broader area problem that involves not just the yards in the narrow sense, but proximity to the station whether it's new structure parking being built and to the projected new rail line which will be rising to an aerial level and making a 90-degree turn all within a very short distance of the yard. There has to be a careful treatment of all the noise in that entire area. (0034 0143-6)

Public Comment: We are pleased that you have expressed a desire to deal with the noise abatement problems; the introduction of structures are certainly very desirable. (0034 0143-5)

> ***Response****: With respect to the concerns of communities on the noise of the Metrorail West Falls Church Yard, the Project Team recommended and the decision-makers approved the enclosure of 1) a portion of the existing loop track at the yard's eastern end and 2) the new yard lead in box structures. These noise mitigation measures by the Project will reduce the wheel squeal noise of the train movements within the Yard. The Project Team notes, however, that new residences have been recently constructed and occupied adjacent to the West Falls Church S&I Yard without any noise mitigation provided by the residential developer. As during the past ten-year effort to address yard noise, there will be coordination among DRPT, WMATA, Fairfax County officials and staff, and representatives of the communities during preliminary engineering and final design.*
>
> *The number of additional cars at West Falls Church Yard has increased from 26 in the Draft EIS to 42 in the Supplemental Draft EIS and Final EIS in order to support the Metrorail fleet of the Wiehle Avenue Extension.*
>
> *Wheel squeal from the new yard lead (for Metrorail trains to and from the Dulles Corridor Line) at the east end of the yard was included in the modeling analysis. Based on measured noise levels from the current wheel squeal along a similar radius curve at the yard, exceedances of the FTA impact criteria are predicted at nearby residences. No exceedances are predicted from the Project's aerial guideway in the median of the Dulles Connector Road.*
>
> *Other noise sources, such as train horns, were not included in the modeling analysis. Brake squeal was not determined to be a major problem. Based on the current operating schedule at the yard, the increase in the overall yard noise due to the cleaning and general operation of 42 additional Metrorail cars needed for the Project is expected to be minimal.*

Inadequacies of Noise Analysis

Public Comment: Deficiencies in the noise analysis. (0483, 4-02), (0499, 4-02), (0500, 4-02), (0501, 4-02)

Public Comment: Additional study of the noise impact at peak cumulative noise levels on the surrounding communities from the enlarged rail yard, its tunnel and curved feeder tracks, the highway, and metal train support. (0483, 4-01), (0499, 4-03), (0500, 4-04), (0501, 4-03)

Public Comment: The Project Team's reliance on noise level averages over a 24-hour period seem to disregard the "annoyance factor" caused by rush hour service, tonal disparities in wheel squeal, vibration, curving rails, as well as increased vehicular traffic. (0137, 4-03)

Public Comment: The statement made in the *Public Hearings Report* that mitigation will be more closely examined once an Locally Preferred Alternative has been selected is premature at best, since a response on page 235 of the report states that no new noise barriers are proposed along the Dulles Toll Road to fix or replace existing barriers. States that the Project Team has underestimated project noise levels since MWAA and VDOT have both underestimated traffic volumes in the past. (0137, 4-04)

> ***Response:*** *As described in Section 4.7of the Final EIS, the noise analysis was conducted according to the FTA Transit Noise and Vibration Impact Assessment (1995) guidelines. Accordingly, the peak-hour equivalent noise level (or Leq) was used to evaluate impacts at non-residential receptors; and the 24-hour day-night noise level (or Ldn) was used to evaluate impacts at residential receptors. Although the FTA criteria are defined in terms of allowable project exposure, the basis for the FTA criteria is actually the increase in the cumulative noise (i.e., when the Project levels are added to the existing noise). To be conservative (or to determine the "peak cumulative noise output"), the modeling analysis included maximum operating volumes for all time periods under both the Metrorail and the BRT Alternatives. For example, the Friday-*

Saturday Metrorail schedule was selected to correspond with the extended operating hours from the then 5:30 AM to 2:00 AM.

In addition to the FTA cumulative noise criteria, peak or maximum noise levels (or Lmax) from transit operations were also used to evaluate Project impacts using the WMATA Design Criteria for various residential land uses. The Lmax noise level is independent of the existing background and the number of operations and represents the maximum level observed during a single event, such as a Metrorail or bus passby.

Although newer pre-cast concrete track structures are proposed to minimize excessive noise and vibration levels, the modeling analysis included a 4-decibel penalty to account for potential structural noise due to Metrorail passbys along all elevated sections of slab track. As described in Section 4.7 of the Final EIS, where exceedances of the FTA or the WMATA impact criteria are predicted, mitigation measures are proposed.

Concerns over Proposed Noise Mitigation Strategies

Public Comment: Draft EIS does not adequately address traffic and visual impacts on Westhampton and proposed mitigation measures for noise do not address neighborhood concerns. (0430, 4-03)

Public Comment: Deficiencies in the proposed noise mitigation strategy with regards to the proposed noise barriers near the track along sections of the Westhampton neighborhood. Additional noise mitigation features such as additional sound barriers and reinforcement of existing sound barriers are needed. (0483, 4-03), (0499, 4-04), (0500, 4-03), (0501, 4-04)

Public Comment: Concerned about the impacts the project will have on his neighborhood specifically, noise, cut-through traffic, speeding, overflow parking, and the lack of sidewalks/curbs. Recommends speed humps and the construction of an adequate sound barrier on the spur of the Dulles Toll Road/I-66 exit. (0423, 4-01)

Response: *Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b in the Final EIS are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.*

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

The Metrorail Extension at the junction with the existing Orange Line in West Falls Church is expected to have a gradual curve with a turning radius of 1,000 feet. Based on the FTA guidelines as well as measurements made at other existing Metrorail curves, wheel squeal is not expected to occur at locations with this curvature. Tangential noise that typically occurs along straight sections of track is expected along this segment of the Dulles Corridor.

Due to structural vibrations, aerial track may exhibit additional structural noise as a result of train passbys along aerial guideway sections. Although the potential for additional structural noise was included in the noise assessment, it is highly unlikely due to the newer structural designs proposed along the Dulles Corridor. Pre-cast concrete supports, resiliently-supported ties, and continuously welded rail (CWR) track included in the proposed track design all combine to greatly minimize overall noise and vibration levels from train passbys along aerial sections.

Consider Non-Transit Noise Impacts and Standards

Public Comment: The discussion of noise pollution in Chapter 4 dismisses the noise impacts based on selective monitoring in only a few neighborhoods. The Mid-Corridor neighborhoods, particularly Chathams Ford (which lacks a sound barrier), already experience major noise pollution. The sound from Metrorail would be deafening and the Draft EIS reliance exclusively on FTA and WMATA criteria to assess the impact unduly minimizes the adverse effects on such neighborhoods. (0510, 4-01)

Public Comment: The Project Team should revise the Draft EIS to meet objectives of intermodal planning in relation to noise from increased vehicle traffic. (0392, 4-01).

Public Comment: Requests that the Project Team more carefully measure and project the cumulative sound levels at many more sites in the area using federal and VDOT standards. Peak sound levels should be studied as well. (0117, 4-01)

> ***Response:*** *The Project Team utilized the guidelines established by FTA (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas, such as yours, with higher background levels, Project noise limits established by the FTA are more stringent than in quieter areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.*
>
> *Additionally, the FTA guidelines were used to evaluate potential impacts due to transit operations. Impacts due to traffic were evaluated using the FHWA guidelines only in those areas where the existing roadways would be modified or substantially changed (e.g., near Metrorail pocket tracks that would require a "bubbling" of the roadway).*

B. Supplemental Draft EIS Comments

State Agency Comments

Noise Analysis and Impacts Should Conform with CEQ Requirements

State Comment: In the PHR, it is stated that the noise methodology for this project followed FTA guidelines appropriate to transit projects. In light of the current Council of Environmental Quality's (CEQ's) NEPA regulations, the project must include a comparative analysis of all alternatives (including the No Build Alternative). Therefore, VDOT interprets that any and all environmental impacts (including noise) will be addressed as part of the Project and conform with CEQ's current requirements. (0091 4-01)

> ***Response:*** *The Draft EIS, Supplemental Draft EIS, and Final EIS have been and will continue to be in compliance with the FTA rule and guidance on environmental impact and related procedures and, thus, are in conformance with CEQ regulations. All environmental impacts, their minimization and avoidance, and their mitigation have been and will be addressed by the project.*

No Build Noise Assessment

State Comment: The SDEIS does not provide a noise assessment for the No-Build Alternative (Section 4.7). (0091 0106-24)

> ***Response:*** *The Dulles Corridor Rapid Transit Project followed FTA noise and vibration methodology appropriate for transit projects. This methodology does not require an assessment of the future No Build noise condition.*

Local Agency Comments

Noise Related to Yard and Service Tracks

Local Comment: The SDEIS commits to the enclosure of this curve [West Falls Church Service and Inspection Yard] as well as the enclosure of a new portal that would connect the main line of the tracks along the Dulles Connector Road with the S & I yard. The proposal to enclose the tracks should be commended; however, it would be helpful if the EIS would note what the noise reduction benefits of the enclosures will be as they relate to event-specific noise impacts - what will be the decibel reduction for individual events that would result from the enclosures? Will wheel squeal from the enclosed tracks be audible? If so, what will the event specific decibel levels be on nearby residential properties? Will any residences still be exposed to noise levels from wheel squeal in excess of 55 dBA? (0093 0109-21)

Local Comment: Section 4.7.1.2 This section notes that additional storage tracks will be needed at the West Falls Church S & I yard "in order to increase the storage capacity from 26 rail vehicles under the Draft DEIS Metrorail Alternative to 42 rail vehicles for the proposed LPA." The new tracks would be located closer to residences than the existing tracks. No information is provided regarding the noise level increases that would be associated with the additional storage, although it is noted that the overall change in noise, when considering both the increased storage and the noise reductions associated with the proposed track enclosures, would be a reduction of seven decibels. It is not clear if this seven decibels reflects an overall average noise level reduction or if it is meant to apply to a hypothetical single event. In any case, more guidance should be provided regarding the nature of the increased noise impacts associated with the additional vehicles (e.g., train movements; horns), and whether there will still be any residential receptors exposed to single event impacts of 55 dBA or more. (0093 0109-22)

Local Comment: The County requests technical back-up information quantifying the benefits of the noise mitigation measures proposed for the West Falls Church S & I Yard ….. (0083 0098-5)

> ***Response:*** *Detailed analysis of the effects of enclosing tracks in the West Falls Church S&I Yard has not been conducted. However an estimated overall reduction of approximately seven decibels (7 L_{dn}) would result for the residents closest to the yard.*

Local Comment: The County requests technical back-up information quantifying the benefits of the noise mitigation measures proposed for the West Falls Church S & I Yard and the efficacy of the noise mitigation measures for aerial sections of track. (0083 0098-5)

> ***Response:*** *Benefits associated with the proposed mitigation measures at the West Falls Church S&I Yard have not been quantified at this time. Quantification of the anticipated noise reductions associated with this proposed mitigation will occur during the preliminary engineering or final design phases of the Project. Technical information regarding the anticipated effectiveness of proposed noise mitigation for sections of aerial guideway (except on Airport property) is provided in the* Noise and Vibration Technical Report (June 2002) *prepared for the Project.*

Public Comments

Need Sound Barriers Along the Dulles Connector Road

Public Comment: Also, we are disappointed that no sound barriers are planned along the Dulles Connector road. They should be, in my opinion, and frankly I am surprised that federal noise pollution guidelines are not already exceeded even without the Metro. (0124 4-01)

> ***Response:*** *Three to four-foot parapets, or sound barriers, are planned along aerial sections of track (except on Airport property) and five to six-foot sound barriers (three-feet above top of rail) are proposed along at-grade sections of track where noise receptors are forecast to exceed FTA criteria under Metrorail operations.*

Need to Upgrade Existing Wooden Noise Barrier Along Dulles Connector

Public Comment: We must have a noise barrier of the latest design. The wooden wall that currently separates my property from the traffic feed was never, I understand, designed to protect against noise. It most certainly does not today.

Section 6.16.3 of the report deals with available mitigation, and does not appear to treat the expected problem specifically.

However, in 6.16.2 the report deals directly with noise barriers. It is necessary, as the report states, that "*effective sound walls be erected before construction begins* (ital mine)." There are additional comments on the subsequent necessity of proper barriers. A coordinated agency effort is vital and needs not simply consideration but absolute insistence**.** (0005, 4-01)

Public Comment: I continue to be troubled by the project's "one-mitigation-fits-all" approach, not only to the widespread concern about noise, vibration, wheel squeal and construction, but to the assumption that this is all of a piece with the project's visual impact. The point has been well made at every hearing that the Dulles Connector has considerable noise problems even without the addition of Metro Rail service.

The project team's fixated response about railside coated concrete parapets as an answer to adjacent homeowner and community fears, does not meet the legitimate concerns of those of us who look at the multi-modal impact of all traffic in the corridor - especially given the woeful underestimation of daily traffic volumes projected when the connector was planned. Analysts' estimates of increasing traffic volumes, even with the addition of rail service, should be a red flag to planners and a spur to a fully coordinated response.

Quite frankly, your team's responses to the public comment in the Feb. 11 report all seem to be directed to a single mitigation measure. Those of us who have labored in the field of government project planning and construction are acutely aware of the stark reality that once something is designed and built, there is not the slightest chance of a "retrofit," no matter how egregious the miscalculation. MWAA's original response to Supervisor Stu Mendelsohn's request in behalf of our community (letter of Sept. 10, 1999) is a case in point. (0036, 4-01)

Public Comment: The wooden fence/noise barrier that was put up when the feeder to Route 66 was built was never intended to mitigate noise level. Rather, it was chosen because it was attractive and blended into the environment. With the increase of traffic over the years, the noise level from the feeder road has increased dramatically, to the point where I cannot be outside and enjoy my patio.

When the project to extended the Metro to Tysons is built, it must include a better, more effective barrier against the noise that is bound to result. Please ensure that this is included in your project plans. (0137, 4-01s)

Public Comment: I am writing to express my agreement with my neighbor's (Mr. Robert Lincoln) comments that are enclosed. (0138, 4-01)

Public Comment: I would like to support Mr. Robert Lincoln as he express his concerns in his letter dated February 20, 2004 as per copy attached. (0139, 4-01)

> ***Response:*** *Highway noise walls are not proposed for the properties along the Dulles Connector Road or the Dulles Toll Road as part of this Project. Three to four-foot parapets or sound barriers are planned along aerial sections of track (except on Airport property) and five to six-foot sound barriers (three to four-foot above top of rail) are proposed along at-grade sections of track where noise receptors are forecast to exceed FTA criteria under Metrorail operations. The types and locations of these noise barriers are described in Section 4.7 of the Final EIS.*
>
> *With respect to the concerns of communities on the noise of the Dulles Connector Road, the*

Commonwealth of Virginia will seek to address the existing noise effects upon the residential communities with noise abatement measures. If the Commonwealth decides to proceed with noise abatement measures, it would bear most of the cost of the abatement, since this is an existing condition due mainly to traffic to and from the Dulles Toll Road. The Project itself would share in the cost of abatement proportional to the Project's contribution to the future levels of noise and to its visual effects. DRPT has been identified as the lead agency for the coordination among VDOT, MMAA, WMATA, FTA, Fairfax County officials and staff, and representatives of the affected communities.

Provide Noise Barrier of Latest Design Before Construction Begins

Public Comment: It is imperative that a noise barrier of the latest design be constructed to keep out both noise and vermin that are bound to encroach. And, as stated in 6.16.2 of the report, "effective sound walls be erected before construction begins."

Lengthy construction and the din of the metro itself will make our community undesirable for those who currently live there as well as perspective buyers unless adequate barriers are erected. (0140, 4-01)

Response*: There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near Ronald Regan Washington National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.*

Many Complaints About Noise Are Not Serious

Public Comment: The many complaints about noise are not that serious. Most of them are about highway noise that they want Metrorail to mitigate for them. (0013, 4-01)

Response: *Thank you for your comment.*

Concern over Noise Impacts in Hallcrest Heights

Public Comment: Hallcrest Heights faces the possibility of being left in an interagency crossfire of non-responsibility because neither VDOT, Fairfax County, nor MWAA will construct adequate noise barriers near the neighborhood. DRPT, WMATA, MWAA and Fairfax County need to coordinate their efforts, as set forth in the Memorandum of Understanding (July 17, 2001). (0137, 4-05)

Public Comment: The Hallcrest Heights neighborhood will need a noise barrier equivalent to that erected at Wolf Trap. It would need to be cast concrete with absorptive coating, that would extend all the way down the off ramp to the merge with Route 123. The noise barrier would need to be installed prior to construction. (0137, 4-06)

Response: *The Project Team utilized the guidelines established by the FTA (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects. However, in areas, such as yours, with higher background levels, Project noise limits established by the FTA are more stringent than in quieter*

areas allowing the ambient levels to remain the same in the future or increase only slightly before an impact is identified.

There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.

Currently, sound barriers are not proposed along the property lines adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property). The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7-5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Roadside sound barriers are typically evaluated during the design of major highway improvement projects such as widening or new alignment when noise impacts are forecast for adjacent noise-sensitive receptors. Evaluation criteria including effectiveness and cost are typically employed to make decisions on sound barrier location, height, and type. Generally speaking, roadside sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Noise Related to Cross Over

Public Comment: The location of the proposed double cross over directly in the middle of the Cleveland Building redevelopment (potentially PRM 3.0 FAR high-rise residential mix use) creates the potential for a crossover "clack" in close proximity to high rise, high density residential development. What assurances do we have that the corridor noise technology or design has improved to avoid this potential nuisance sound. (0123 0158-20)

Public Comment: We are very concerned about location, noise, and set backs of cross over (the breaker station) on the Cleveland site. Please provide specific details so that we may evaluate these issues. (0123 0158-24)

Response: *In response to this comment and others of WEST*GROUP, the Project Team shifted the double crossover approximately 170 feet inbound towards the Dulles Connector Road interchange. Its location is now near the ramp terminal of the interchange and the east property line of the Cleveland Building parcel. The parapet walls that are part of the standard WMATA aerial guideway would provide significant sound attenuation for trains passing through the switches at the proposed double crossover. The size of the double crossover is the standard size shown for 14' (narrow) track centers, which is significantly less than the size of a double crossover for 40.5' (wide) track centers that were previously examined.*

Noise in Neighborhoods and Affecting Specific Properties

Public Comment: I live at 2134 Greenwich Street. My property is right where the Dulles Road swings off of Rt. 66, and the noise has been unbearable. No sound barrier has ever been constructed and we never received an acceptable answer as to why. Please speak to the noise issue. I am very concerned about additional noises, both during and after the building is completed. I believe I shall now be forced to move because of the noise. As it is now I cannot enjoy my yard because the noise is so stressful. (0011 0011-1)

> ***Response:*** *Estimated L_{dn} noise levels from Metrorail operations along Greenwich Street are predicted to range from 55 to 59 dBA. These levels are below the measured background of 62 to 65 dBA. Based on current traffic levels, the ambient noise level in 2025 with Metrorail service would increase approximately 1 decibel to range from 63 to 66 dBA. As a result, no exceedances of the FTA noise criteria are predicted from Metrorail passbys at receptors along the Greenwich Street neighborhood.*

Public Comment: Currently, no sound wall or barrier exists in our neighborhood [Chathams Court] nor is there a plan for the construction of a wall in the EIS draft or supplement. At present time, there is a sever noise problem in our neighborhood where sound levels exceed the accepted limits. (0116 0141-1)

Public Comment: We live in the Westhampton neighborhood and are very much affected by the new projects (garage, etc.) Our community needs soundbarrier, (0121 0155-1)

Public Comment: Our family lives at 1552 Hunting Avenue in McLean, VA, which will be located in close proximity to the newly proposed Metrorail route through Tysons Corner. Our house is adjacent to the Dulles Access Road, near Route 123. The proposed Metrorail would become aerial at this location. There have been no provisions in the impact statement to address increased noise caused to my community. Specifically, I believe that installation of sound barriers, at a minimum, should be included in the plans to protect the community. (0122 0156-1)

> ***Response:*** *Three to four-foot parapet barriers are planned for all aerial Metrorail track sections in accordance with WMATA design criteria. Five to six-foot parapets are proposed in areas adjacent to noise receptors that were forecast to exceed FTA noise criteria under Metrorail operations. The recommendation for five to six-foot parapets was based on the projected need for additional noise reductions, which would bring levels below the FTA impact criteria.*

Public Comment: My home and residential property back on the 25-foot wooded area (which I believe is managed by the Virginia Department of Transportation) next to an aerial portion of the proposed Dulles Corridor Rapid Transit line. This particular aerial portion is to be sharply curved to go from the Route 66 access road into Tysons Corner. The aerial curve obviously will result in tremendous wheel squealing, deceleration, and other attendant loud noise from trains on the Dulles line. This is to urgently request inclusion of a proper noise-protective wall at the aerial curve under Phase 1 of the new proposal. The existing aged wooden wall on the property here is not a noise-protective wall and is quite different from the noise-protective walls erected on various other parts of the Rapid Transit System. I understand that U.S. and Virginia legislators, and state and local authorities, have been fully informed about the noise problem and consider vital the erection of a noise-protective wall at the aerial curve. (0005 0005-1)

> ***Response:*** *There is a potential for wheel squeal noise based on the 800-foot radius of curvature proposed near the Hallcrest Heights. However, to better define the onset of wheel squeal, actual source measurements were conducted along an existing Metrorail line near Ronald Regan Washington National Airport with a radius of 755 feet. Based on the results of the modeling analysis, ambient day-night noise levels from the Metrorail operations are predicted to range from 50 to 54 dBA at the Hallcrest Heights residences. The modeling analysis includes three to four-foot parapets (or barriers along the edge of the track bed) proposed along all sections of aerial guideway (except on Airport property). These levels are well below the measured ambient background noise level of 59 dBA recorded at a residence at 7405 Hallcrest Drive. As a result, no exceedances of the FTA criteria are predicted from Metrorail operations near Hallcrest Heights.*

Currently, sound barriers are not proposed for properties along the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property), although five to six-foot parapets are used in some areas. The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS. Figures 4.7- 5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street. Generally speaking, roadside sound barriers are not constructed except in conjunction with major highway improvements. Major highway improvements are not anticipated in conjunction with the Dulles Corridor Rapid Transit Project.

Public Comment: My house was built in 1972, which pre-dates the Connector Road. On behalf of the Virginia Department of Rail and Public Transportation (VRail), WMATA will dismantle the wooden sound wall to create a staging area for the construction of the Tie Breaker Station. This raises the following question: Does the governing law allow VRail to restore the wall to its original (i.e., non-conforming) condition or must VRail meet the VDOT standard of abating noise up to the top of the first floor of a residence? (0025 0026-6)

Response: *Currently, new and taller highway noise walls are not proposed for properties adjacent to the Dulles Connector Road or Dulles Toll Road as part of the Project. The Project Team recommended and the decision-makers approved that a new wooden noise wall surround the TBS-2 for its security, for enhanced community safety and for the aesthetics of the neighborhood. Since TBS-2 would not be visible from the Baldwin Drive neighborhood, it would not receive any architectural treatment. The new wooden noise wall would have doors at the location of the doors of the TBS-2 and the remote train control room. The height of the new wooden noise wall would be sufficient to screen the TBS-2, which has a height of 13 feet above its concrete slab foundation.*

Public Comment: We request the following additional study and mitigation: More analysis of the adequacy of the proposed noise mitigation measures at additional test points in our neighborhood. (0026 0027-5)

Response: *The Project Team utilized the guidelines established by (Transit Noise and Vibration Impact Assessment, 1995) to determine the applicable noise impact criteria in all areas of the proposed corridor. FTA noise criteria are based on existing noise levels that increase as the background level increases to a point beyond which impact is determined on Project noise alone. The FTA criteria are not used to assess existing background noise but rather, are used to evaluate impacts due to new transit projects against the background of existing noise levels. Where background noise is already high, as in your area, it takes only a relatively small increase to trigger an impact.*

Currently, sound barriers are not proposed for properties along the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets or track edge barriers are proposed along all aerial Metrorail sections (except on Airport property), although five to six-foot parapets are used in some areas. The types and location of the proposed mitigation measures are described in Section 4.7of the Final EIS. Figures 4.7- 5a and 4.7-5b are included to help identify the location of the proposed five to six-foot parapet barriers closest to your street.

Future efforts during preliminary engineering and final design will refine the analysis and include coordination among DRPT, VDOT, WMATA, MWAA, FAA, and Fairfax County to determine the need for application of any additional mitigation measures to address existing traffic noise conditions.

Duration of Noise Impacts

Public Comment: Project officials have informed us that: During peak hours, a train will run every seven (7 minutes), and during off-peak hours, a train will run every 12 minutes; Sunday through Thursday, hours of service will be from 5:30 am until midnight, and during Fridays and Saturdays, from 5:30 am until 2:00 am or possibly 3:00 am; and Non-service activities will occur when there is no passenger activity. Thus, we have the possibility of experiencing "rail activity" (a euphemism for NOISE) all day and all night, every day and every night, or in the words of our young people: "24/7." The rail switches behind my house will add additional noise to the neighborhood. Project officials have stated that they will install noise abatement measures at grade level. But rail activity and noise will be constant. (0025 0026-3)

> ***Response:*** *Cumulative future noise levels are a function of the magnitude of both the ambient background level as well as the noise from transit operations. FTA criteria allow the ambient noise levels to increase 1 to 3 decibels (depending on the current background level). Project noise levels are predicted to increase the ambient level by less than 2 decibels. Where exceedances of the FTA criteria are predicted, mitigation measures are proposed that would reduce the transit noise level below the background. The future noise levels are a logarithmic sum of the predicted Project noise levels and the measured background levels.*

Public Comment: [We request] Commitment from the appropriate agencies that nighttime (11pm to 6am) noise during construction will not exceed levels deemed acceptable for post-construction daytime noise, as measured from stakeholder properties. (0088 0103-1)

> ***Response:*** *During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures will also be employed.*

Sound Abatement Walls and Other Mitigation Treatments

Public Comment: Please take note that we stand in agreement re noise abatement with our many neighbors on both sides of the current Dulles connecting route, between the West Falls Church Metro station and Tysons Corner. While no one in our household or employ will have cause to use or benefit by the Dulles Rail, we support the need for mass transit. Nonetheless, we are concerned about adding to the already constantly increasing noise in our own backyard, and to the many nearby neighborhoods along the proposed route – And we sincerely hope that effective sound walls will be erected before construction begins. You are also no doubt aware that Dominion Power began last summer with a plan to institute increasingly extreme tree cutting within its easements, thereby further decreasing any natural barrier to the sound and sight problems of adding the rail line to the existing roadway. (0017 0018-1)

Public Comment: We are property owners on Baldwin Drive the proposed metro line will literally run behind our house. We would like to know if you plan to put walls up to block some of the noise or if you do not know do you know who I can contact to find out about the walls? (0024 0025-1)

> ***Response:*** *Parapets (or track edge barriers) would assist in shielding new noise from Metrorail trains along aerial (above-ground) sections of track. At those locations where exceedances of the FTA criteria are predicted, higher parapets (five to six-feet) are proposed to minimize the predicted Project-related impacts. Changes to the existing highway noise barriers along the Dulles Connector Road are not included as part of the Project.*

Public Comment: It is my understanding that under VDOT standards, a sound wall is required to reach the top of the first floor of a residence. There are at least three residences in the Great Falls Manor neighborhood- including my house- where the sound wall does not meet this standard. Thus, all of the residents in the Great Falls Manor neighborhood who live adjacent to the Connector Road incur significant noise pollution- both inside the house and outside- when we engage in any activity above the level of the sound wall. (0025 0026-4)

Response: *Since capacity improvements are not proposed for area roadways as part of the Project, traffic noise evaluations were not conducted near the Great Falls Manor neighborhood. Changes to existing roadway noise barriers are not proposed as part of the Dulles Corridor Rapid Transit Project. Parapets (or track edge barriers) would assist in shielding new noise from Metrorail trains along aerial (aboveground) sections of track. At those locations where exceedances of FTA criteria are predicted, higher parapets (five to six-feet) are proposed to minimize the predicted Project-related impacts.*

Public Comment: The residents of Great Falls Manor will incur rail switches, a Tie Breaker Station and an access roadway. The existing wooden sound wall will be dismantled to create a staging area for construction of the Station. All we ask is that the wooden sound wall be replaced with a similar sound wall that is taller and more effective in shielding the residents from the increased noise and light pollution. (0025 0026-5)

Public Comment: They say that "fences make the best neighbors," but in our case, "sound walls make the best neighbors." We need a taller sound wall. If a taller sound wall were constructed, then any future increase in vehicular traffic, rail activity, noise, lights, etc., will have been obviated in advance. We urge the project personnel to consider what they would want for themselves or their loved ones, if they lived on Baldwin Drive. All we ask is that you do the "right thing" by the residents of the Great Falls Manor neighborhood. (0025 0026-8)

Public Comment: Additional noise and visual mitigation with concrete sound walls at the roadside, vegetative plantings and additional sound muffling for the aerial portion of the revenue tracks. (0026 0027-6)

Response: *Parapets (or track edge barriers) would shield new noise from Metrorail train passbys along all aerial (above-ground) sections of track. At those locations where exceedances of FTA criteria are predicted, additional parapet heights (five to six-feet) are proposed to minimize the predicted Project-related impacts. Changes to existing roadway noise barriers are not proposed as part of the Dulles Corridor Rapid Transit Project.*

Public Comment: The new lower rail alignment will still run above existing sound walls at the roadside. Existing sound walls are ineffective and too short, and there is no sound wall at all between the Dulles Connector Road and some homes in our community. (0026 0027-8)

Public Comment: A higher and more extensive concrete sound wall at the roadside, vegetative plantings and additional sound muffling for the tracks because the rail line will run above the existing barrier and some homes have no barrier. (0087 0102-6) (0089 0104-6) (0099 0115-6) (0104 0121-4)

Response: *Three to four-foot parapet barriers are planned for all aerial Metrorail track sections in accordance with WMATA design criteria. Five to six-foot parapets are proposed in areas adjacent to noise receptors that were forecast to exceed FTA noise criteria under Metrorail operations. The recommendation for five to six-foot parapets was based on the projected need for additional noise reductions, which would bring levels below the FTA impact criteria.*

Public Comment: A sound barrier similar to that adjoining Wolf Trap is what is clearly justified. Such a barrier (aimed at both visual and noise mitigation) should extend all the way down the off-ramp through the merge with Route 123. (0036 0037-3)

Public Comment: While your report (in Section 4.7.3) speaks of "temporary noise barriers" being erected during construction, I would urge that a coordinated agency mitigation effort result in a significant barrier before construction to mitigate construction noise, operating noise and the visual impact all at once. (0036 0037-5)

Public Comment: Third, a sound barrier similar to that adjoining Wolf Trap is what we feel is justified. Such a barrier aimed at both visual and noise mitigation should extend all the way down the off-ramp through the merge with Route 123 which is our northern border. (0036 0062-3)

Public Comment: The wooden sound wall that was put up in 1980 is clearly inadequate even as things stand right now. Since part of it is going to have to be dismantled for purposes of constructing the tie-breaker station, we would like encourage the project officials to consider putting up a taller sound wall. (0025 0065-3)

> ***Response:*** *Currently, sound barriers are not proposed for the properties along the Dulles Connector or the Toll Road as part of the Project. Three to four-foot parapets barriers are planned for all aerial Metrorail track sections and five to six-foot parapets are proposed in areas where noise receptors are forecast to exceed FTA criteria under Metrorail operations. The locations of the proposed mitigation measures are described in Section 4.7 of the Final EIS and shown in Figures 4.7-5a and 4.7-5b.*
>
> *During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures will also be employed.*

Public Comment: As stated in the DEIS, WMATA may construct low sound walls along track level. This may reduce some of the rail noise, however, regardless of the sound absorptive materials added to the walls, the current impact highway noise will be reverberated off the walls into our neighborhood thus worsening the already severe impact. This statement was confirmed at our meeting with the WMATA managers. (0116 0141-6)

> ***Response:*** *Absorptive treatment of the proposed parapet barriers could help to reduce the amount of highway noise reflected from these structures. Further analysis of the effectiveness of proposed mitigation measures will be conducted during preliminary engineering or final design.*

Public Comment: WEST*GROUP is concerned that the change in radius location of 100 feet and increase in curve length from 800 feet to 1000 feet to mitigate noise levels on a rail line 67 feet above grade has been offset by the cross over and its related “clack.” We are pleased that the pocket track at the Tysons East Station has been removed but remain concerned that the noise may need further mitigation to allow the development at the new station to be successful. (0113 0132-8)

Public Comment: WEST*GROUP is concerned that the change in radius location of 100 feet and increase in curve length from 800 feet to 1000 feet to mitigate noise levels on a rail line 67 feet above grade has been offset by the cross over and its related "clack". We are pleased that the pocket track at the Tysons East Station has been removed but remain concerned that the noise may need further mitigation to allow the development at the new station to be successful. We suggest that additional studies be completed as a part of the future design efforts to ensure that all appropriate noise mitigation techniques are included in the final design. (0123 0158-10)

> ***Response:*** *The Project Team evaluated the potential for noise and vibration impacts and provided recommendations on potential mitigation strategies to avoid significant impacts. Proposed mitigations are presented Section 4.7 of the Final EIS. Parapets (or track edge barriers) would assist in shielding new noise from Metrorail trains along aerial (above-ground) sections of track. At those locations where exceedances of the FTA criteria are predicted, higher parapets (five to six-feet) are proposed to minimize the predicted Project-related impacts.*

Cumulative Noise Generated by Auto Traffic and Rail

Public Comment: The other issue that I hope can be addressed is the need for a real sound barrier wall along the areas in our neighborhood that now have some of the highest road noise, dirt and carbon monoxide levels along the corridor. I know that the amount of bus and commuter traffic noise has

constantly increased over the last few years along the hours when traffic is heavy. The 24 hour rail schedule and maintenance will significantly add to the problem. (0003 0013-2)

Public Comment: My community has an already existing and growing noise issue associated with escalating traffic since the construction of the airport connector segment. Since purchasing my lot in 1984, I have witnessed traffic noise increasing from a mild nuisance level to levels that at times preclude meaningful outdoor conversation…and it continues to get worse. There is no doubt that the traffic noise has been compounded by the enhanced connectivity of the highway originally intended to serve just as an airport connection but now linked to both the Dulles toll-road (with all ancillary traffic feeds) and the Greenway. Such broadened connectivity has unquestionable served to materially alter the utility scope of the highway. (0014 0015-1)

Public Comment: I am writing to express my concern regarding Metrorail being extended down the Dulles Access Road. The access road is my backyard "neighbor" and as a Realtor I have already experienced difficulty in selling homes backed up to Rt. 66. We live daily with the roar of traffic. Trains passing by our bedroom windows every 15 minutes for most of the day would be unbearable. At this point there isn't even a soundwall, what would it be like with trains? What do you say, let's forget Metrorail on the access road, and spend less money putting up a sound-wall. (0022 0023-1)

> ***Response:*** *Parapets (or track edge barriers) would assist in shielding new noise from Metrorail trains along aerial (above-ground) sections of track. At those locations where exceedances of the FTA criteria are predicted, higher parapets (five to six-feet) are proposed to minimize the predicted Project-related impacts. Changes to the existing highway noise barriers along the Dulles Connector Road are not included as part of the Project.*

Public Comment: Total corridor noise from multiple sources (be it from rubber tires, metal wheels, diesel engines or traction motors) must be addressed. (0036 0037-1)

Public Comment: I urge the Project team to look beyond the application of FTA criteria and to work with the other agencies to mitigate total corridor noise. Given the woeful underestimation of traffic volumes projected in the 1981 EIS for the Dulles Connector, such a joint agency coordination of mitigation is surely justified. Most analysts predict a substantial increase in vehicular traffic, even with the addition of Metrorail. (0036 0037-4)

Public Comment: The total Corridor noise from multiple sources, be it rubber tires, metal wheels, diesel engines or traction motors, must be addressed. (0036 0062-1)

> ***Response:*** *Since the Dulles Corridor Rapid Transit Project proposes only transit improvements, FTA transit noise criteria were used in order to determine the potential for noise impacts.*

Funding for Noise Abatement

Public Comment: I believe the construction of what I would call the Hallcrest Barrier can be achieved within the excess revenues generated each year by the tolls on the Dulles Toll Road, which I understand are about $12 million. (0036 0062-5)

> ***Response:*** *Currently, sound barriers are not proposed for the properties along the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets barriers are planned for all aerial Metrorail track sections and five to six-foot parapets are proposed in areas where noise receptors are forecast to exceed FTA criteria under Metrorail operations. The types and location of the proposed mitigation measures are described in Section 4.7 of the Final EIS.*

Public Comment: While I understand the constraints of your project budget and available funding for what you propose, I believe that construction of the Hallcrest Barrier can be achieved within the excess revenues generated each year by the tolls from the Dulles Toll Road. Even after including debt service

and operations and maintenance, these annual excess revenues amount to more than $12 million. (0036 0037-6)

> ***Response:*** *On behalf of the Commonwealth of Virginia, DRPT has the lead in addressing the existing noise effects of the Dulles Connector Road. With respect to the concerns of communities on the noise of the Dulles Connector Road, the Commonwealth of Virginia will seek to address the existing noise effects upon the residential communities with noise abatement measures. If the Commonwealth decides to proceed with noise abatement measures, it would bear most of the cost of the abatement, since this is an existing condition due mainly to traffic to and from the Dulles Toll Road. The project itself would share in the cost of abatement proportional to the project's contribution to the future levels of noise and to its visual effects. There will be coordination among DRPT, VDOT, WMATA, MWAA, FAA, Fairfax County officials and staff, and representatives of the affected communities.*

Multiple Benefits from Sound Abatement Walls

Public Comment: While your report (in Section 4.7.3) speaks of "temporary noise barriers" being erected during construction, I would urge that a coordinated agency mitigation effort result in a significant barrier before construction to mitigate construction noise, operating noise and the visual impact all at once. (0036 0037-5)

Public Comment: We do not oppose the construction of the Rapid Transit Project, but we do to the increased burden it's construction will place on those of us who are directly adjacent to the project, that the WMATA should place a high priority on protecting homeowners from adverse environmental impacts both during the construction of the Rapid Transit Project and after the construction has been completed and the trains are running. In our opinion an environmental wall would be a the major solution to our concerns. Such a wall would alleviate three of our major concerns, noise, light and visual impact. (0081 0096-1)

> ***Response:*** *Currently, sound barriers are not proposed for the properties along the Dulles Connector Road or Dulles Toll Road as part of the Project. Three to four-foot parapets barriers are planned for all aerial Metrorail track sections and five to six-foot parapets are proposed in areas where noise receptors are forecast to exceed FTA criteria under Metrorail operations. The types and location of the proposed mitigation measures are described in Section 4.7 of the Final EIS.*

Public Comment: In our opinion an environmental wall would be the major solution to our concerns. Such a wall would alleviate three of our major concerns, noise, light, and visual impact. (0081 0107-2) (0100 0116-2) (0101 0118-2) (0127 0162-2)

Public Comment: In our opinion an environmental wall would be the major solution to our concerns. Such a wall would alleviate three of our major concerns, noise, light, and visual impact. (0124 0159-2) (0125 0160-2) (0126 0161-2) (0128 0163-2) (0129 0164-2) (0133 0172-2)

> ***Response:*** *Three to four-foot parapet barriers are planned for all aerial Metrorail guideway sections. Five to six-foot parapets are proposed in areas adjacent to noise receptors that were forecast to exceed FTA noise criteria under Metrorail operations. The recommendation for five to six-foot parapets was based on the projected need for additional noise reductions, which would bring levels below the FTA impact criteria.*

Noise Abatement not Necessary

Public Comment: Sound barriers are a negative idea. People offended by present highway noise must not be allowed to load up MetroRail with sound barriers that will reflect noise back into the cars full of people. This argument came up at West Falls Church on Highway I-66. There was noise allright, but it was highway noise. I went out there one night at midnight when civic noise is low and listened. I never

heard a train go by in the median. I am not referring to the yard tracks. I could not hear most automobiles either, but illegal trucks and souped up cars were very noisy. If traffic were heavier, traffic would make more noise. Electric rail transit on welded rail should not be heard. On a curve, perhaps a sound barrier four feet high may be necessary, but no higher. It reflects noise back into the car close by. If the highway needs sound barriers, so be it. Put them at the edge of the right-of-way. Do not box the trains in. That will not attenuate highway noise, the source of the complaint. (0054 0090-2)

> ***Response:*** *Currently, sound barriers are not proposed for the properties along the Dulles Connector or the Toll Road as part of the Project. Three to four-foot parapets barriers are planned for all aerial Metrorail track sections and five to six-foot parapets are proposed in areas where noise receptors are forecast to exceed FTA criteria under Metrorail operations. The types and location of the proposed mitigation measures are described in Section 4.7 of the Final EIS.*

Alternative Methods of Sound Abatement

Public Comment: To remain positive and helpful, let me call your attention to a recent Washington Post article of the Koolhas design for the Green Line of the Chicago Transit Authority's elevated track section through the Illinois Institute of Technology. In a giant leap forward in noise mitigation, they propose putting the elevated service in an imaginative steel and concrete tube. (0036 0037-7)

> ***Response:*** *The Dulles Corridor Rapid Transit Project will utilize parapet barriers to reduce noise impacts on aerial guideway sections. Noise mitigation features such as those described by the commenter are proposed for the West Falls Church Yard.*

Public Comment: Metro might be responsible for the impact it creates if our current forestation were demolished, as will be required for the construction of the storm water best management practice pond. This individual did state that WMATA engineers would do their best to minimize the size of the storm water retention pond; however current plans and drawings still call for approximately one acre of my property to be acquired. If the present-day mature forestation is torn down, in my opinion Metro has to be responsible for the noises. The trees are the only sound and visual barrier at this time. (0116 0141-3)

> ***Response:*** *The Final EIS does not project any Project-related noise impacts associated with development of storm water ponds.*

Construction Related Noise

Public Comment: We are very concerned about potential noise levels relating to construction, should the above referenced project go forward. We are a residential community that would suffer adversely from both construction noise (especially if it were to occur during off-hours) and the compounding of already significant traffic noise. (0014 0015-3)

> ***Response:*** *During construction, DRPT would comply with noise limits established by FTA and WMATA guidelines, federal law (for Wolf Trap Farm Park), and time-of-day restrictions specified in local noise ordinances. If necessary, temporary mitigation measures will also be employed.*

More Study and Analysis Needed

Public Comment: Mr. Dittmeier we have lived here for 30 years and went through this process before, during and after the Dulles Corridor was constructed. The planners and those that worked out the detailed projections of impact on our community are no longer around to answer for their errors or miss calculations. I hope we can do a better job with this project. It might help to understand our concern if the present noise/pollution data were compared with the earlier data collected when the original corridor was being proposed and constructed. (0003 0013-3)

> ***Response:*** *The Project Team has reviewed the earlier studies as part of the background research for our analysis.*

Public Comment: We request the following additional study and mitigation: More study of the adequacy of proposed noise mitigation measures. (0087 0102-5) (0089 0104-5) (0099 0115-5) (0104 0121-3)

> ***Response:*** *The Project Team evaluated the potential for noise and vibration impacts and provided recommendations on potential mitigation strategies to avoid significant impacts. Proposed mitigation is presented Section 4.7 of the Final EIS. Parapets (or track edge barriers) would assist in shielding new noise from Metrorail trains along aerial (above-ground) sections of track. At those locations where exceedances of the FTA criteria are predicted, higher parapets (five to six-feet) are proposed to minimize the predicted Project-related impacts.*

Public Comment: Our neighborhood conducted an independent study, sound study, in July 2002. Our findings did differ greatly from the 63 decibels measured at a single home by the initial task force. The average of 70 to 71 decibels of which we obtained in our neighborhoods is in the severe impact zone already established by the FTA. Sustained decibel readings greater than 80 decibels were obtained both in the morning and evening rush hour times. These data did not make it into the draft EIS. (0116 0141-2)

> ***Response:*** *Based on the FTA methodology for analysis of noise associated with transit projects, the existing day-night (24-hour Ldn) noise level is used to determine what additional noise can be added before an impact is predicted in association with the proposed Project. Using an existing level of 63 decibels (which is what the Project Team measured as the 24-hour day-night noise level) was appropriate for this methodology. The existing level is used in order to determine what additional noise can be added before impact criteria are exceeded and mitigation is considered.*

Joint Agreement on Noise Abatement

Public Comment: This project should not be permitted to move forward without a mutually agree upon noise abatement plan between WMATA, VDOT, and our neighborhood. How can WMATA and VDOT continue to dodge responsibility for the highway noise problem and at the same time allow this project to move forward? (0116 0141-4)

> ***Response:*** *On behalf of the Commonwealth of Virginia, DRPT has the lead in addressing the existing noise effects of the Dulles Connector Road. With respect to the concerns of communities on the noise of the Dulles Connector Road, the Commonwealth of Virginia will seek to address the existing noise effects upon the residential communities with noise abatement measures. If the Commonwealth decides to proceed with noise abatement measures, it would bear most of the cost of the abatement, since this is an existing condition due mainly to traffic to and from the Dulles Toll Road. The Project itself would share in the cost of abatement proportional to the Project's contribution to the future levels of noise and to its visual effects. There will be coordination among DRPT, VDOT, WMATA, MWAA, FAA, Fairfax County officials and staff, and representatives of the affected communities.*

4.8 Vibration

A. Draft EIS Comments

State Agency Comments

Locations and Methods for Mitigating Vibration Impacts from Metrorail Extension

State Comment: The first sentence on page 93 [of the Noise and Vibration Technical Report] incorrectly states, "While vibration criteria are generally used to assess annoyance from transit sources at the exterior façade of receptors, ground-borne noise, or the rumbling sound due to vibration room surfaces, is typically assessed indoors." In fact, both ground-borne vibration and noise effects are assessed indoors.
* Section 4.8.2 should be more specific with regard to the locations and proposed methods for mitigating

vibration impacts from Metro rail operations. In addition to the potential measure listed, the use of spring rail or moveable point frogs at crossover locations should also be considered. (0421, 0421-A -12)

> ***Response**: To clarify, all ground-borne vibration and noise levels from Metrorail passbys were evaluated against the FTA and the WMATA impact criteria at the exterior façade of receptors (i.e., the closest distance between the receptor and the project alignment). Unlike environmental noise, which is typically evaluated outdoors, ground-borne vibration and noise are evaluated indoors where vibration levels from transit passbys are most pronounced.*

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received.

4.9 Hazardous and Contaminated Materials

A. Draft EIS Comments

State Agency Comments

Draft EIS Identification of 34 Sites Not Identified in the Environmental Database Search Results

State Comment: Solid and Hazardous Waste Management. Soil suspected of contamination, and wastes that are generated, must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations, including but not limited to the Virginia Waste Management Act (Virginia Code sections 10.1-1400 et seq.), the Virginia Hazardous Waste Management Regulations (9 VAC 20-60 et seq.), and the Virginia Solid Waste Management Regulations (9 VAC 20-80 et seq.). (See the attached comments from DEQ's Waste Division, Office of Remedial Programs.) According to DEQ's Northern Virginia Regional Office, the Draft EIS mentions the identification of 34 contamination sites that were not identified in the Environmental Database Search results. We recommend that these sites be discussed with that Office. (0407, 0407-A -19)

State Comment: Section 4.9 discusses field reconnaissance done in the study area and the identification of thirty-four (34) sites that were not identified in the Environmental Database Search results. Will these sites be discussed with DEQ? (0407, 0407-A –38)

> ***Response**: The Project Team will coordinate with the VDEQ Northern Virginia Regional Office regarding the potential contamination sites that were identified by the Project Team and not included in the Environmental Database Search results. This coordination will take place during preliminary engineering.*

Guidance on Demolishing Buildings With Asbestos or Lead-Based Paint

State Comment: As mentioned above and in the Draft EIS, the structures to be demolished as part of this project have not yet been checked for the presence of asbestos-containing materials or lead-based paint. The following guidance pertains in the event either of these substances is found.

(a) Asbestos Abatement. If asbestos-containing materials (ACM) are found, following their classification as friable or non-friable, all waste ACM shall be disposed of in accordance with the Virginia Solid Waste Management Regulations (9 VAC 20-80-640), and transported in accordance with the Virginia regulations governing Transportation of Hazardous Materials (9 VAC 20-110-10 et seq.). The project manager should contact the DEQ Waste Management Program and the Department of Labor and Industry for additional information.
(b) Lead-Based Paint. The project must comply with the U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) regulations, and with the Virginia Lead-Based Paint Activities

Rules and Regulations. For additional information regarding these requirements, the project manager should contact the Department of Professional and Occupational Regulation.

(c) Air Quality Regulation. As indicated above, heating units may require new source review or operating permits from DEQ. In addition, open burning activities may require an open burning permit. Questions on these matters, and inquiries about time-of-year restrictions on the use of cut-back asphalt, may be directed to DEQ's Northern Virginia Regional Office. (0407, 0407-A – 20)

***Response**: Prior to demolition of any building, a survey is required by a Virginia licensed asbestos inspector and Virginia licensed lead-based paint inspector. Demolition of buildings or structures involving regulated asbestos and lead-based paint would be carried out using appropriate procedures and disposal practices, including the Federal Lead Exposure in Construction Standard, the Virginia Solid Waste Management Regulations, and the National Emission Standard for Hazardous Air Pollutants.*

Disposal of Contaminated Soil Consistent with Federal, State and Local Laws

State Comment: Since this project may involve construction, any soil that is suspected of contamination or wastes that are generated must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations. Some of the applicable state laws and regulations are: Virginia Waste Management Act, Code of Virginia Section 10.1-1400 et seq.; Virginia Hazardous Waste Management Regulations (VHWMR) (9VAC 20-60); Virginia Solid Waste Management Regulations (VSWMR) (9VAC 20-80); Virginia Regulations for the Transportation of Hazardous Materials (9VAC 20-110). Some of the applicable Federal laws and regulations are: the Resource Conservation and Recovery Act (RCRA), 42 U.S.C. Section 6901 et seq., and the applicable regulations contained in Title 40 of the Code of Federal Regulations; and the U.S. Department of Transportation Rules for Transportation of Hazardous Materials, 49 CFR Parts 107,171.1-172.558. (0407, 0407-A –31)

***Response**: Information regarding the appropriate disposal methods and safety precautions associated with these substances will be provided in the Hazardous Materials Management Plan developed prior to any construction activities.*

State Comment: Hazardous and solid waste issues and sites were addressed in the report. The central office of the Waste Division did a cursory review of its data files and did not find any additional sites that might impact this project. (0407, 0407-A –30)

***Response**: Thank you for your input.*

State Comment: The report states that structures to be demolished have not been checked for the presence of asbestos-containing materials (ACM) or lead-based paint (LBP). They should be checked and if LBP or ACM are found, in addition to the Federal waste-related regulations, State regulations 9VAC 20-80-640 for ACM and 9VAC 20-60-261 for LBP must be followed. (0407, 0407-A –32)

***Response**: Prior to demolition of any building, a survey is required by a Virginia licensed asbestos inspector and Virginia licensed lead-based paint inspector. Demolition of buildings or structures involving regulated asbestos and lead-based paint would be carried out using appropriate procedures and disposal practices, including the Federal Lead Exposure in Construction Standard, the Virginia Solid Waste Management Regulations, and the National Emission Standard for Hazardous Air Pollutants.*

State Comment: Finally, pollution prevention was not addressed in the report. VDEQ encourages all construction projects and facilities to implement pollution prevention principles, including the reduction, reuse, and recycling of all solid wastes generated. (0407, 0407-A –33)

State Comment: DEQ encourages the project manager to reduce solid waste at the source, re-use materials, and recycle wastes to the maximum extent practicable. The Draft EIS did not address pollution prevention, according to DEQ's Waste Division. (0407, 0407-A –5)

> ***Response****: Pollution prevention for solid waste generated as a result of construction activities will be addressed in the Hazardous Materials Management Plan to be developed prior to any construction activities.*

State Comment: Solid and Hazardous Waste Management. DEQ's Division of Waste Program coordination, Office of Remedial Programs (hereinafter "DEQ's Waste Division") did a cursory review of its data files and did not find any contamination sites that might affect, or be affected by this project. The Draft EIS addressed hazardous and solid waste issues (pages 4-170 through 4-184, section 4.9). (0407, 0407-A –4)

> ***Response****: Comment noted.*

State Comment: Hazardous Contamination Materials Technical Report (June 2002) * No additional comment since the review comments of the 95% Draft EIS, on 3/10/02 (0421, 0421-A –9)

> ***Response****: Comment noted.*

State Comment: Integrate pollution prevention techniques into facility maintenance and operation, to include the following: inventory control (record-keeping and centralized storage for hazardous materials), product substitution (use of non-toxic cleaners), and source reduction (fixing leaks, energy-efficient HVAC and equipment). Maintenance facilities should be designed with sufficient and suitable space to allow for effective inventory control and preventive maintenance. (0407, 0407-A –17)

> ***Response****: Comment noted.*

Local Agency Comments

Coordinate Hazardous Materials Management Plan with Fairfax County Fire and Rescue Department

Local Comment: Preparation of the project's Hazardous Materials Management Plan should be coordinated with the County's Fire and Rescue Department. (0479, 0479-L –6)

> **Response**: *Preparation of the Hazardous Materials Management Plan will be coordinated with the County's Fire and Rescue Department, as requested. Preparation of this plan will not take place until all environmental documentation is complete.*

Public Comments

Project Impacts or Asbestos and Groundwater

Public Comment: There are community questions regarding projection of residents and commuters during construction from naturally occurring asbestos around Hunter Mill Road. Many residents around Hunter Mill Road are on wells. The EIS discussion is on surface water. What will happen to ground purity, groundwater purity? (0179, 0179-T –9)

Public Comment: There are environmental concerns regarding the naturally occurring asbestos in old service tanks and it is unclear how the communities in near proximity will ultimately be impacted. Additionally, it appears that new soil test have been performed. (0150, 0150-T-7)

> ***Response:*** *A Fairfax County Report entitled Control and Prevention of Asbestos Exposure from Construction in Naturally Occurring Asbestos (January 1993) states, "In an undisturbed natural*

environment, these fibers [naturally occurring asbestos] are locked in place within the rock and represent no health hazard." Asbestos fibers are not soluble in surface or ground water and therefore, would not pose a threat to surface or groundwater resources.

Prior to implementing any soil disturbance activities in areas that may contain naturally occurring asbestos minerals, a compliance plan would be prepared and submitted to the Fairfax County Health Department for review and approval.

B. Supplemental Draft EIS Comments

State Agency Comments

Compliance with Applicable Regulations

State Comment: Soil suspected of contamination, and wastes that are generated, must be tested and disposed of in accordance with applicable Federal, State, and local laws and regulations. (0080 0094-12)

State Comment: As we stated in our reply to the Draft EIS, dated August 27, 2002 (DEQ-02-124F, page 9, item 11), DEQ advocates that principles of pollution prevention be used in all construction projects as well as in facility operations. Effective siting, planning, and on-site Best Management Practices (BMPs) will help to ensure that environmental impacts are minimized. (0080 0094-9)

State Comment: If asbestos-containing materials (ACM) are found, following their classification as friable or nonfriable, all waste ACM shall be disposed of in accordance with the Virginia Solid Waste Management Regulations (9 VAC 20-80-640), and transported in accordance with the Virginia regulations governing Transportation of Hazardous Materials (9 VAC 20-110-10 et. seq.). (0080 0094-13)

State Comment: The project must comply with the U.S. Department of Labor, Occupational Safety and Health Administration (OSHA) regulations, and with the Virginia Lead-Based Paint Activities Rules and Regulations. (0080 0094-14)

State Comment: Pollution prevention was not addressed in the SDEIS. DEQ encourages the proponents to implement pollution prevention principles, including the reduction of solid wastes at the source, re-use of materials, and recycling of waste materials. (0080 0094-3)

***Response:** Comment noted. All Project activities will be completed in accordance with relevant federal, state, and local laws and regulations and accepted Best Management Practices.*

4.10 Energy

A. Draft EIS Comments

No comments pertaining to this topic were received.

B. Supplemental Draft EIS Comments

Public Comments

Documentation of Energy Analysis

Public Comment: The Supplemental Draft Environmental Impact Statement is in error when it says that Dulles Rail in opening year will increase energy usage 0.31% over No Build and +3.7% when completed. The SDEIS estimate the elimination of 214,500,000 vehicle miles traveled in opening year and 257,400,000 VMT when completed. This is in scale with 53,600 initial passengers on Dulles Rail and 86,900 when completed. At 22 miles per gallon, 9.7 million gallons will be saved the first year and 11.2

million gallons when completed. To run the trains, you need only 36 million kilowatt hours if energy will be added, equal to only 2,500,000 gallons of gasoline. The energy usage shall go down 63 percent for the specific people involved. We should save $11 million a year on use of foreign oil refined into gasoline. (0054 0055-1)

> ***Response:*** *The energy analysis was conducted according to FTA guidance for the determination of energy effects. Your analysis suggests that energy savings due to the Project will be much greater than estimated in the Supplemental Draft EIS and Final EIS.*

Public Comment: The SDEIS envisions energy usage that would increase by only 1.6% with a Phase 1 project. An objective and adequate source generation analysis needs to be conducted and presented. The data needs to be re-evaluated and defensibly explained in a manner that accounts for the incremental energy expenditure at coal-fired power plants that are used to provide the source of power for Metrorail trains – i.e., electricity from coal-burning power plants. Such power is referred to as source-generation and needs to be factored into a meaningful environmental impact statement. (0068 0173-32)

> ***Response:*** *Project Team utilized methodologies consistent with that described in the FTA's Reporting Instructions for the Section 5309 New Starts Criteria (April 2004). The methodology used to assess the energy consumption impacts of the Project is outlined in the FHWA report entitled Energy and Transportation Systems (July 1993) and in the* Energy and Transportation Manual (Caltrans 1983)*. See Section 4.10 of the Final EIS for the discussion on energy impacts.*

5.0 ECONOMIC EFFECTS

5.1 Economic Conditions

A. Draft EIS Comments

Public Comments

Public Comment: In general, the proposed rail system mainly benefits the commercial interests of Tysons Corner property owners (especially those within close proximity of a rail station) and some of the workers in those buildings (mainly people who live near metro stations). It doesn't seem to offer any benefits to other people in the Tysons/McLean area. (0233, 0426-M –28)

> ***Response:*** *As identified in Chapter 1 of the Final EIS, the goals for the Dulles Corridor Rapid Transit Project include improving transportation service and increasing transit ridership, among others. One of the project purposes is to provide an alternative to auto travel to help meet increases in travel demand. By providing a high-quality link to the existing Metrorail system, the project would improve mobility for residents and employees throughout the Washington metropolitan region*
>
> *Although the Wiehle Avenue Extension and Full LPA would not serve the travel needs of all trip makers in the Dulles Corridor, the Project—in combination with the planned transit-oriented urban form—offers alternative means of travel for the growing number of residents, employees, and visitors in the Dulles Corridor, helping to increase overall mobility in the corridor. In this way, they would benefit adjacent residents who would not directly benefit from the new transit service.*
>
> *Other highway and transit improvements that would address the existing and potential future deficiencies in Northern Virginia's transportation system are recommended in the Northern Virginia 2020 Plan, the Statewide Transportation Plan, and local comprehensive plans.*

Financial Impact of Loudoun County Joining WMATA Compact

Public Comment: And finally, as a major Loudoun County taxpayer, the Greenway is concerned that the financial impact on Loudoun County of becoming an active member of the WMATA compact has not been adequately discussed and that the operational and capital improvement subsidies to be paid by Loudoun County will be enormous in relation to the number of riders. Terminating the line at Route 606 should allow Loudoun County to obtain benefits from the availability of mass transit while minimizing the capital costs and the subsidies. (0257, 0257-T –9)

> ***Response:*** *The Loudoun County Board of Supervisors with support of the Office of County Administrator and the Office of Transportation Services has fully considered the capital and operating funding plans of the Project's financial analysis. Loudoun County has endorsed the Project for its benefits in mobility, in support of future development and in support of environmental quality. In cooperation with the Commonwealth of Virginia through the course of the Major Investment Study of the mid-1990s and through the current NEPA process, the County has consistently endorsed the locations of the Route 772 Station and the Route 606 Station.*

Distribution of Economic Benefits

Public Comment: Residents in my neighborhood are exemplary citizens who make significant contributions to the county and state through real estate, personal property, sales and other taxes. The Dulles Corridor Project will primarily benefit individuals residing in the outer suburbs or other states who want an easier commute into the Washington, DC and Tysons Corner areas. Those of us who reside near the project will benefit to a much lesser degree if at all, yet we will shoulder a disproportionate share

of the burden through our higher property and real estate taxes, as well as the quality of life burdens referenced above. (0425, 0425-E –3)

Response: *As identified in Chapter 1 of the Final EIS, the goals for the Dulles Corridor Rapid Transit Project include improving transportation service and increasing transit ridership, among others. One of the project purposes is to provide an alternative to auto travel to help meet increases in travel demand. By providing a high-quality link to the existing Metrorail system, the project would improve mobility for residents and employees throughout the Washington metropolitan region.*

Although the Wiehle Avenue Extension and Full LPA would not serve the travel needs of all trip makers in the Dulles Corridor, the project—in combination with the planned transit-oriented urban form—offers alternative means of travel for the growing number of residents, employees, and visitors in the Dulles Corridor, helping to increase overall mobility in the corridor. In this way, they would benefit adjacent residents who would not directly benefit from the new transit service.

Other highway and transit improvements that would address the existing and potential future deficiencies in Northern Virginia's transportation system are recommended in the Northern Virginia 2020 Plan, the Statewide Transportation Plan, and local comprehensive plans. This program of improvements is being evaluated and developed by VDOT, DRPT, and others.

Positive Economic Benefit of Metrorail

Public Comment: Two KMPG studies confirmed that MetroRail earned the Commonwealth of Virginia a nineteen (19) percent return annually on the Commonwealth's investment, in addition to the local county gains. Clearly, MetroRail is highly profitable for all concerned even though it operates at a bookkeeping loss. (0013, 0013-L –28)

Public Comment: MetroRail to Dulles and Loudoun County is well worth $67.3 million per year. Property values in the Dulles corridor will increase by roughly $12.5 billion, based upon parallel experiences, yielding approximately $185 million annually in additional tax receipts, or, more hopefully, a reduction in the property tax rate as occurred when MetroRail came to Huntington Avenue and Vienna. (0013, 0013-L –27)

Public Comment: Wherever metrorail goes, prosperity follows. Metrorail is a tangible and measurable asset for both businesses and local economies. (025, 0253-T –3)

Public Comment: Living near a metro station is one of the best things that can happen to you. And, as your transportation options get better, your house becomes worth, if you are living near it, an enormous amount of money. I'm surprised my little 1500-square-foot house is now worth half a million on the market, but that's because I'm close to a metro station. (0263, 0263-T –2)

Response: *Proximity to Metrorail stations has been shown to have positive impacts on property values. The increased property values and amount of development allowed by proposed density bonuses adjacent to some Metrorail stations could increase property tax receipts for local government in the Dulles Corridor. However, changes to local property tax rates are solely within the control of the local government (i.e., Fairfax and Loudoun counties).*

The Project Team agrees that rail transit has been shown to have positive effects on property values in the vicinity of transit stations. As described in Chapter 3 of the Final EIS, the corridor is one of the region's fastest growing areas and is expected to continue growing over the next 25 years; however, implementation of the Wiehle Avenue Extension and the Full LPA are expected to have a significant positive impact on the intensity of development in station areas.

Request Disclosure of Property Ownership

Public Comment: Oh yes, there was also a speaker at the Ashburn session that said the properties in East Loudoun would benefit from rail (I would think it would be rail or BRT…but he only said RAIL). I guess there wouldn't be any objection to a full disclosure of who all the owners and/or partners are of those properties that are likely to benefit from rail? (0233, 0426-M –18)

> ***Response***: *Without knowing the specifics of the comment referred to in this statement, only a general reply can be prepared in relation to disclosure of property owners. In general, mobility and land development benefits will be generated by the presence of BRT or Metrorail in Loudoun County, not only for property owners within close proximity to transit stations, but also to residents, employers, and visitors to the county who will enjoy enhanced transit access. The Final EIS does not identify parcel ownership information for the properties adjacent to the proposed station areas, or ownership information for all of Eastern Loudoun County, as requested in the comment. However, this information is available online in the Loudoun County Assessment and Parcel Database at www.loudoun.gov.*

Concern of Impact on Property Values and Neighborhood

Public Comment: Again, I am not saying that I would favor abandonment of the project, but it is only fair to consider the welfare of those of us on Greenwich and other streets that may be affected. I refer not only to noise and traffic but to reduction of property values and potential neighborhood deterioration. (0307, 0307-E –3)

> ***Response****: The LPA is expected to have positive effects on commercial and residential properties located near transit stations. As described in greater detail in Chapter 5 of the Final EIS, the LPA would contribute to greater economic development by encouraging or supporting higher-density residential and commercial land uses around transit stations. Past experience with the Metrorail system has demonstrated that transit investment has had positive effects on the residential and commercial development near the stations. It is expected that new development around station areas in the Dulles Corridor would also attract businesses from outside Fairfax and Loudoun counties, providing net economic benefits. Negative neighborhood impacts are not anticipated. Chapters 3 and 4 of the Final EIS document social and environmental effects associated with implementation of this project. Where appropriate, specific mitigation measures are proposed.*

Public Comment: I also urge the state to take measures to compensate homeowners for the reduction of property values that will undoubtedly follow the construction phase and completion of this project. (0425, 0425-E –1)

> ***Response:*** *The LPA is expected to have positive effects on commercial and residential properties located near transit stations. As described in greater detail in Chapter 5 of the Final EIS, the LPA would contribute to greater economic development by encouraging or supporting higher-density residential and commercial land uses around transit stations. Past experience with the Metrorail system has demonstrated that transit investment has had positive effects on the residential and commercial development near the stations. It is expected that new development around station areas in the Dulles Corridor would also attract businesses from outside Fairfax and Loudoun counties, providing net economic benefits. Negative neighborhood impacts are not anticipated. Chapters 3 and 4 of the Final EIS document social and environmental effects associated with implementation of this project. Where appropriate, specific mitigation measures are proposed.*

Request Explanation of Calculation of Economic Benefits

Public Comment: On one page, you project $1.1 billion in economic benefit for Loudoun vs. Fairfax. How does that break down by county? How did you come to that number? (0112, 0382-L –13)

Public Comment: On pages 30 and 31 of the "Economic and Secondary Development Effects Technical Report," you calculate a $323 million economic effect for Fairfax and Loudoun counties through BRT, and $1.736 billion for rail. How does that break down by county? How did you come to that number? Does this mean BRT pays for itself but rail does not? (0112, 0462-L –41)

> ***Response****: As described in Chapter 5 of the Draft EIS, each of the Build alternatives would have a positive effect on the local and state economy as a result of construction expenditures. These effects include impacts on employment, output and earnings as funds are spent and re-spent throughout the economy. These temporary effects vary for each alternative, based on the amount of construction expenditures, the type of expenditures and timing of the expenditures. Measuring these effects provides a measure of the relative effects of each build alternative as compared to the No Build Alternative. While the analysis does account for funds that would have been spent within the Counties whether a build alternative is implemented or not, it is important to note that these effects represent the redistributive economic effects of increased federal and state funding within Fairfax and Loudoun counties. These are one type of economic impact, and do not necessarily represent the full cumulative effects of the project on the regional economy.*
>
> *In preparing the Final EIS, the Project Team applied multipliers from the US Department of Commerce, Bureau of Economic Analysis' (BEA) Regional Input-Output Modeling System (RIMS II). These multipliers, which reflect the industrial base of the region, are multiplied by the direct capital expenditures in order to calculate the total effects on the regional and state economy. The multipliers used reflect the economic base of Fairfax and Loudoun counties combined; BEA does not provide a Fairfax County only multiplier, as the raw data does not permit this disaggregation.*

Suggestion for Calculating Economic Impacts on Dulles Corridor Residents

Public Comment: The Draft Impact Statement did not contain the economic impact on residents of the Dulles Corridor. Recommendation: Present EIS Cost Model examples as:
- Family of four - two incomes both working in Reston/Herndon
- Family of four - one income working and DC and one income working in Reston/Herndon - mass transit user and POV required use.
- Single person living and working in Reston/Heron.
- Single mother of two (2) minor children - living in Reston/Herndon and working in Tysons - mass transit user.
- Single mother with two minor children living and working in Reston/Herndon. (0427, 0427-E –2)

> ***Response****: The Final EIS evaluated the economic impacts of the alternatives resulting from construction expenditures, ongoing operations and maintenance, and changes in the property tax base as a result of property acquisition. The analysis requested in the comment is at a greater level of detail than needed to support a decision about providing transit alternatives in the Dulles Corridor and would be highly speculative due to the general nature of the classifications identified. An economic analysis of this specificity is not required element of the Final EIS.*

Impacts on Increasing Tolls on the Dulles Toll Road

Public Comment: What immediate and long-term impact will more-than-doubling the tolls on the Dulles Toll Road have on traffic volumes and safety on local roads such as Sunset Hills, Hunter Mill, Crowell, Browns Mill, and Beulah Roads which are used by commuters as an alternate route between Reston and Tysons Corner? (0460, 0460-L –5)

Public Comment: How will more than doubling the Dulles Toll Road tolls impact residential property values of the Hunter Mills Road corridor communities? (0460, 0460-L –6)

> ***Response****: The proposed increase in the toll levels is not expected to have a negative impact on property values in the Dulles Corridor. Any increases in travel costs, which could be capitalized in*

property values, are expected to be offset by positive effects of increased transit access and transportation capacity in the corridor

Impact of Lack of Adequate Parking on NADA

Public Comment: The lack of adequate parking will also detract from the favorable aspects of the Headquarters Building and undermine the ability of NADA to retain and attract tenants. (0477, 0477-L –10)

Public Comment: In order to retain and attract tenants, owing to the adverse impacts of visual blight and reduced parking capacity NADA must make virtually permanent financial concessions with respect to rates, tenant allowances and lease terms. The Headquarters Building's fair market value will decline substantially as a result of these financial concessions. (0477, 0477-L –11)

***Response**: The comments relate to visual impacts of the T4 Alignment in Tysons Corner and the loss of parking due to the placement of a Traction Power Substation on the NADA property. The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Concern Over Parking Garages Impeding Joint Development

Public Comment: They are also concerned about the garage itself. It does take up all of the Security Storage and Templeton Oldsmobile site. However, they do believe that there are alternatives that could result in having parking for that station in conjunction with some joint development opportunities, and we will be providing written testimony to that fact between now and August 29th. (0161, 0161-T -3)

Public Comment: Parking facilities. Much of the EIS work tried to evaluate how much parking was going to be needed at the various stations, and they did come up with a 2000-space parking facility in Tysons Corner at your Tysons West station, and we are kind of concerned about this, because the places next to stations are your hundred percent corner, where if you put out development, you could generate the greatest ridership and you could also have high quality development that has the highest taxable ratables generating greater tax returns for the county. We suggest that this particular station area [Tysons West] not be used as an interim station, but that the county once again encourage the property owners to develop a long-term plan for transit-oriented village on that particular site in Tysons Corner. It's a great opportunity to get more residents there. (0141, 0141-T –5)

Public Comment: While joint development opportunities with the private sector that include limited parking facilities represents a viable alternative to the DEIS proposals, TMS Limited Partnership has concern that the timing of when the Commonwealth is prepared to construct the parking-related facilities versus when the market could support such a joint development program may not match. Once they're in place, they're likely to remain. (0135, 0135-T –6)

***Response:** Facilities proposed as part of the Final EIS at the Tysons West Station do not preclude transit-oriented development at this location. The Project Team recognizes the importance of residential and commercial development in proximity to station areas. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations.*

Consider Ad Valorem Tax Revenue as Part of Local Subsidy

Public Comment: I suggest that the economic impacts should discuss the increase in ad valorem tax revenue caused by the construction of the mass transit to Dulles. The increase in the ad valorem tax revenue, an increase in the cost of county services to serve the development that will occur along the corridor, and the annual contribution that the county will make to the mass transit system. It is possible

that the increase in ad valorem tax, minus the cost for funding county services, will generate subsidies that will finance the annual contributions that the local jurisdictions will have to make. The expected revenue, increased cost and resultant surplus, the annual county contributions and any deficits or surplus should be estimated and put in the final environment impact statement and considered during decision-making. (0279, 0279-T –1)

> ***Response:*** *Chapter 8 of the Final EIS discusses the Project's capital funding strategy. It describes the capital cost estimate, presents the expenditure schedule of capital costs, identifies the capital funding sources and shares, and describes the financing approach for the Wiehle Avenue Extension and the Full LPA. The financial analysis and planning documented in this Final EIS reflects a level of detail appropriate for a project in the planning phase. The next phases of project development - preliminary engineering and final design - will define the project in detail, produce more reliable cost estimates and result in a final financial plan.*
>
> *As described in Chapter 5 of the Final EIS, construction of the Wiehle Avenue Extension and the full LPA represents significant capital investment in the local economies of Fairfax and Loudoun counties. This spending would increase the employment, earnings and output for the duration of the construction process. These impacts are not long-term and are not included in the financial analysis or funding strategy.*

Positive Impact of Metrorail on Local Employment

Public Comment: Metrorail serves as an icon in local employment. It stands as one of the largest and most stable employers for many area residents. Metrorail employees and their families use the system and shop and spend their money with our local businesses. (025, 0253-T –4)

Public Comment: Metrorail is an icon in local employment, it stands as one of the largest employers of area residents. These same professional and courteous Metro employees ride this very same system to shop and spend their money with our local businesses. (0278, 0278-T –2)

> ***Response***: *Chapter 5 of the Final EIS documents the positive impacts implementation of the project would have in creating jobs and earnings as a result of ongoing operations and maintenance expenditures.*

Potential Impact on Employment of Local 2 Union Members

Public Comment: If this were a metro construction project, we would find Local 2 office and professional employees, professional and union employees, engaged in such activities as engineering design review, right-of-way acquisition, such as I am engaged in, construction inspection and procurement. But, ladies and gentlemen, and elected officials, appointed officials, this is not a true exclusive metrorail construction project. Rather this project is under the auspices not only of WMATA but more directly the State of Virginia through its Department of Rail and Public Transit. With that circumstance and situation, that Virginia state department, we understand, is or will be the applicant for a federal grant from the Federal government for funding for this project, and it will also be responsible for the activities that I previously outlined, engineering design review, right-of-way acquisition, construction inspection, and procurement. Now that the state of Virginia has options in the way that it does that. It can do that itself, it can do that through consultants or perhaps other means. The point of what I have said is with some irony, I suppose, while we have the metro-like project going forward, it could result in negative employment impacts for Local 2 union members at Metro in those disciplines that I described. (0187, 0187-T –1)

Public Comment: Consequently, Local 2 union is concerned for it professional employees, particularly in this realm, over issues of job security, project safety, project construction quality, and project procurement procedures. (0187, 0187-T –2)

Public Comment: Tonight, however, I learned two principal things. First, that this probably will not be a WMATA project, but rather it will be a project of the Virginia Department of Rail and Public Transit. That

agency has been identified, not in the public hearing but in the exhibit room, as something like the "project owner" - not Metro. And that the State of Virginia Department of Rail and Public Transit would be operating under a Virginia law called the PPTA. That law is identified informally to me as the "Public Private Transportation Act." It concerns me that the State of Virginia, having jurisdiction over this project, in a right-to-work-for-less state, will probably exclude any way, shape, or form of labor-organized labor union participation, to the great detriment, not only of WMATA employees, but also the citizens of the State of Virginia, the citizens of Fairfax County, and the citizens of the region that comprises the jurisdictions that compose the Washington Metropolitan Transit Authority. (0187, 0282-T –1)

Public Comment: The second part of this direction that this project is headed in has to do with contracting out for the work overall for this project. I understand from a reliable source in the exhibit room, that even at this time a particular firm is either negotiating with or about to negotiate with the State of Virginia for something that I would call a design-build contract. It's unclear whether this is being done competitively or not, but it sounded to me as though this arrangement is not being put out for competitive proposals or bids. So in contracting out this work to a private firm, design-build contractor, even more of the union positions at Metro, like architects, engineers, attorneys, real estate specialists, etcetera, that work done by those people at WMATA will be taken away and given to these others, from other firms outside of Metro. (0187, 0282-T –3)

Public Comment: Now, the public should know that the main reason for my great concern about the direction that this project is headed, in this respect, is that Local 2 has a collective bargaining agreement with WMATA, which specifies what is to be done and what is not to be done by Local 2 union representatives. This is my initial reaction that the direction that this project is taking, as I have described previously in my comments, subject to my further review of the collective bargaining agreement and discussion with my colleagues at Local 2, including the elected officers and Executive Board members. This direction and action being taken on this project could very well represent a substantial violation of the Local 2 WMATA labor agreement. I don't know that for a certainty, but I'm going to research it immediately. And I don't say that in a threatening tone or direction, but merely to let the public know that there are some of us in organized labor who view this approach that's being taken as an anti-labor union move, to the detriment of organized labor representatives at WMATA, including those in Local 2. (0187, 0282-T –4)

Public Comment: This direction that this project is headed in appears to be an anti-union labor project, and that concerns me very, very greatly. If this project were controlled from start to finish by WMATA, we would have the same labor union arrangements that we have had on the 106-mile system. The essential part of the first aspect is that there will be a loss of jobs in the real estate right-of-way acquisition realm. The work that my colleague Local 2 labor union members and I do in the Office of Property Management and Development, will not be done by us, it will be done by others, either directly by employees for the State of Virginia, in the right-to-work-for-less state, or by some contracted out consultants, who will work for even less than the right-to-work-for-less state employees, thus taking away jobs from union members at Metro. (0187, 0282-T –2)

Public Comment: We would like to invite, urge and encourage the Metro management to meet with representatives of Local 2 as soon as possible to explain to us, consistent with the terms and conditions of the existing collective bargaining unit, if not the spirit, to share with us how this project in it peculiar arrangements is going to impact the employees of Local 2 at Metro. (0187, 0187-T –3)

> ***Response:*** *Comment noted. The Virginia Department of Rail and Public Transportation (DRPT) is the project sponsor. Its approach to project development entails the following: 1) that DRPT is the program manager, Federal grant applicant and recipient, design/build contracting authority and initial owner of the Project, and 2) that WMATA is DRPT`s technical manager of NEPA process, of preliminary engineering (PE) and of the design/build contract and will be the leaseholder of the Project, its operator and ultimate owner.*
>
> *DRPT has received FTA approval to conduct preliminary engineering and an FTA grant to fund this effort All PE activities that involve FTA grant management, FTA liaison and FTA project*

management oversight are the responsibility of DRPT. DRPT has negotiated and executed a Comprehensive Agreement with Dulles Transit Partners, LLC (DTP) to be its PE consultant; as the technical manager of PE, WMATA will direct the day-to-day work of DTP. DTP is comprised of Bechtel Corporation and Washington Group International. For development of the project, DRPT is responsible for right-of-way acquisition, environmental permitting, interagency agreements, utility agreements, final financial plan, funding agreements and more.

The method used for scheduling meetings between representatives of the Office And Professional Employees International Union, Local No. 2, AFL-CIO and WMATA management is beyond the scope of the Draft EIS, Supplemental Draft EIS and Final EIS. It is suggested that the Local No. 2 representatives request a briefing through normal WMATA channels.

B. Supplemental Draft EIS Comments

Public Comments

Positive Economic Impact of Transit Investment

Public Comment: The extension of a full scale, efficient transit system in the Dulles Corridor will do as much to stimulate the economy of this area as the opening of the Dulles Toll Road did in the 1980's. (0041 0042-4)

Public Comment: Please emphasize the facts stated in 5.1.1.2 Para. A and B. This economic data has not been used in “selling rail” and is quite impressive. (0113 0132-9)

Public Comment: Please emphasize the facts stated in 5.1.1.2 Para. A and B. This economic data has not been used in "selling rail" and is quite impressive. (0123 0158-11)

Response: *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and will be considered by decision-makers in the preparation of the Final EIS.*

Public Comment: So he [Dr. Steven Fuller] said the economy would be in terrible trouble unless Northern Virginia continues to grow and, again, brought in Dulles Rail now. (0060 0063-2)

Response: *Comment noted. Growth in the Dulles Corridor is expected to continue to outpace growth throughout the region. The Purpose and Need for the proposed action, as described in Chapter 1 of the Final EIS, includes the need to support future development in the region.*

Clarification Regarding the Economic Impact Analysis of Bus and Rail

Public Comment: In the DEIS and SDEIS, reference is made that the economic impact from rail is greater than if bus had been the preferred alternative. Please demonstrate through density credit analysis for rail and density credit for bus the difference for each of the transit stations. (0109 0128-8)

Response: *Because the purpose of the Supplemental Draft EIS was to provide additional information on the effects of refinements to the LPA, the economic effects estimated in the Supplemental Draft EIS consist of regional economic impacts resulting from construction expenditures for the proposed LPA and LPA Phase 1 (now referred to as the Wiehle Avenue Extension), as compared to the No Build Alternative and the Metrorail Alternative. Chapter 5 of the Final EIS addressed the potential secondary development impacts of the various alternatives, based on existing zoning and the density bonuses allowed under the Fairfax County Comprehensive Plan. Chapter 9 of the Final EIS assessed the potential population and employment effects of the secondary development.*

5.2 Station Area Development

A. Draft EIS Comments

Public Comments

Develop Plan for Funding Community-Friendly Element of Stations

Public Comment: Plans for making the stations more community-friendly through design competition, local control of operating policies, and training of staff. Plans for phasing of land development and provision of affordable housing. And, finally, and perhaps most importantly, development of a plan for funding these other improvements - these and other improvements from the economic growth that will occur in the station areas. (0173, 0173-T –10)

> ***Response:*** *The Dulles Corridor station architecture shown in the General Plans incorporates WMATA's "New Look" design now being advanced for the New York Avenue Station and the two stations of the Largo Extension. This concept retains key principles of Harry Weese's original design, with more inviting and better-defined entrances, an emphasis on customer information, and an open, graceful, and light feel through the use materials such as steel and glass for enclosures. These are systemwide "signature" elements that support a unified system identity as well as economical design and construction. The project is expected to maintain a high level of design quality regardless of whether design competitions are held. Station configurations do not preclude community facilities and functions separate from station facilities. WMATA station agents are well-trained for safe and efficient transit customer service.*
>
> *The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be the goals of the efforts. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering. Relative to the phasing of development, provision of affordable housing, and funding provided for these activities associated with the growth that could potentially occur in the transit station areas, all policy decisions controlling these activities are under the purview of the local jurisdictions.*

Physical Impacts of Tysons Parking Structure

Public Comment: However, the Owners do have concerns over the specific facility designs for the Tysons [West] rail station. All Metrorail alternatives and the BRT alternative in the Draft Environmental Impact Statement propose that a 2,000-car commuter-parking garage be located on the Security Storage and Templeton Oldsmobile sites. This large structure would occupy one of the key redevelopment sites at the Tysons West Station and is a major concern to the Owners. We suggest that a commuter parking garage of this magnitude is not appropriate for this area. Tysons Corner is viewed as the "downtown" of Fairfax County and, as such, rail service should be planned to implement that vision. Attracting commuters into Tysons Corner so that they may park and use Metrorail to reach other destinations such as Washington, DC, Arlington or Dulles Airport seems contrary to the Tysons Corner Comprehensive Plan. This station area should be planned so as to maximize the number of residents and workers within walking distance of the station. Not only will this garage occupy one of the "100% corners" at the Tysons West station, it will also impede pedestrian flow from adjacent property north and west of the station area. We suggest that this commuter garage be relocated to another station outside of the Tysons Corner area and allow the Tysons Corner stations to function in a more urban not suburban design. (0400, 0400- L-2)

Public Comment: However, if it is concluded that a commuter-parking garage is a necessary component to the Tysons West station, we suggest that there are other design alternatives that would make this commuter facility blend in better with other transit related mixed-use development. For example, if the 2,000-car requirement were spread out over several sites as opposed to being massed on one site, it would allow for better distribution of commuter parking spaces and an ability of the property owners to

absorb this commuter-parking requirement as part of their private development. This essentially would result in a joint development effort of public parking and private parking to support a private transit related mixed-use development. We have commissioned studies of how the commuter parking could be integrated into proposed development plans for the 22 acres and find that it could be accommodated without requiring WMATA's acquisition of the Security Storage and Templeton Oldsmobile sites. (0400, 0400- L-3)

> ***Response:*** *The park-and-ride facility of Tysons West Station has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts. The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known. The park-and-ride would be accessed from local roads, and its cost is part of Wiehle Avenue Extension.*

B. Supplemental Draft EIS Comments

Public Comments

Transfer of Property for Stations

Public Comment: As you are aware, this past June, the Fairfax County Board of Supervisors unanimously approved our zoning to allow for a mixed-use development at Tysons II in conjunction with the FFGA for rail through Tysons. One of our proffers is the dedication of the land necessary for the Tysons Central Station in the T-6 alignment to Fairfax County. While we are not seeking any monetary compensation for this dedication, there are a number of items that we will require be incorporated in any transfer agreement to accommodate this rail station. The method of this incorporation has yet to be determined.
Although we are 18 to 24 months away from the FFGA, we believe that the discussions regarding these items referenced below should begin as soon as possible so as to complete the transfer as soon as possible following the FFGA.
The transfer agreement among other things, would have to cover the following items:
- Design approval of the station.
- Maintenance of the station and our rights to self-help.
- Construction staging and access.
- Sound attenuation.
- Station access on both the north and south sides of Tysons Boulevard.
- The name of the station.
- Construction coordination, including scheduling.
- Insurance.
- Other relevant items.

0008 0008-1

> ***Response****: The issues you have raised will be addressed through continuing coordination by the DRPT and WMATA as the project moves beyond the environmental review process and into preliminary engineering and final design.*

5.3 Development Effects/Potential

A. Draft EIS Comments

State Agency Comments

Increased Development of Tysons Corner Rail Stations

State Comment: There will be increased intense development around rail stations. There's a sizeable amount of land that's underdeveloped land in Tysons Corner. For example, there's a 13-acre parcel located next to the Lincoln that is underdeveloped and owned by the West Group which is a major supporter of the transit rail. There's also a 100-acre property that also has some underdeveloped parcels. (0147, 0147-T –3)

State Comment: What about let's look at transportation; let's look at whether these metro stations in Tysons Corner and in this corridor are really going to carry the amount of development that's being suggested by the developers. This should not be a developers' plan, but a transportation plan. I'm afraid it's a developers' plan. (0136, 0136-T –5)

> ***Response:*** *Relative to the comments made, the change in development character in Tysons is discussed in Chapter 5 of the Final EIS. The analysis addresses potential development within Tysons Corner at the proposed transit station areas. Some of this secondary development may be on undeveloped parcels as noted in the comment. The form of development and implementation of any site-specific private development opportunities within the corridor is under the control of local jurisdictions.*
>
> *The LPA is expected to have positive effects on commercial and residential properties located near transit stations. As described in greater detail in Chapter 5 of the Final EIS, the LPA would contribute to greater economic development by encouraging or supporting higher-density residential and commercial land uses around transit stations. Past experience with the Metrorail system has demonstrated that transit investment has had positive effects on the residential and commercial development near the stations. It is expected that new development around station areas in the Dulles Corridor would also attract businesses from outside Fairfax and Loudoun counties, providing net economic benefits. The actual level of development and implementation of any site-specific private development opportunities within the corridor is under the control of the local jurisdiction.*

Careful Planning for Related Land Use Impacts

State Comment: Careful planning for the related land use impacts is essential. Rail will bring dramatic changes to the area- whether these are positive or negative will depend on the land use planning. This is an unprecedented opportunity to implement "smart growth" principles throughout the Corridor. Both Fairfax and Loudoun counties have adopted Comprehensive Plans that support increased mixed-use development around the rail stations. Careful coordination of land use and transportation plans, with extensive public participation, needs to continue and take the highest priority. (0298, 0298-L –8)

> ***Response:*** *As stated in Chapter 5 of the Final EIS, the local jurisdiction's land use regulations supporting transit-oriented development have been summarized in relation to the project as an evaluation of the potential change in development characteristics at the transit station areas The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. However, all land use decisions are under the jurisdiction of local government. All stations have been designed to provide access to development in the vicinity of the station for riders, residents, employees, and visitors.*

Revisions to Figure 3.1-2 Map of Proposed Land Use in Corridor

State Comment: Pg. 3-11, Fig. 3.1-2 - Proposed Land Use in the Corridor: Map and insert identify major roads (Dulles Toll Road, Beltway) as Open Space. Suggest additional label in the legend. (0421, 0421-A –19)

Response: *The Final EIS properly displays proposed land use in Figure 3.1-1.*

Comments on Economic and Secondary Effects Technical Report

State Comment:

- Page 28 [of the Economics and Secondary Effects Technical Report] - Tax Revenue Effects - "Construction of the Build Alternatives will require the purchase of some private land and/or structures for easement, rights-of-way, parking and station facilities, thereby removing these properties from the existing local tax base."
- Should any necessary lands be obtained through a process that would allow for density transfers, which is often the case; there would be no loss of tax revenue. In addition, under this process there may be no cost for acquisition.
- Page 105 - Secondary Effects Related to Density Increases - "The allowable transit-related growth will result in an increase in development in the immediate vicinity of stations throughout the corridor, but does not represent a dramatic increase over the overall level of growth allowed in the Fairfax and Loudon counties."
- As this is already a congested corridor, "an increase of approximately 38 million of 43 million square feet of development over the Baseline Alternative (Page 112)" with associated increase in work vehicle trips of "20,000 per day" (Page 114) and increase of non-commute vehicle trips of "50,000 per day" (Page 114), does pose a significant threat for increased delays.
- "transit related growth allowed in Loudon County was not included (in) the supplemental transportation demand analysis."
- One proposal in Loudoun County calls for the development of some 19 million square feet of office space alone at the Route 772 Station. No resultant impacts of such development on the Metro rail system, the surrounding roadways, and the corridor in general are provided in the report.
- "Even without mobility benefits associated with the provision of rapid transit improvements, the corridor is projected to absorb high level of development under the Baseline Alternative."
- While it may be possible to physically add all this new development under the Baseline Alternative, it does not seem reasonable to assume that it would actually be built with the higher traffic congestion that would result from such development.
- Page 125 - MITIGATION - The mitigation strategies contained in the report speak mainly to the opportunity of the local jurisdictions to limit development in the area of the transit stations if undue congestion is experienced in the area. The report does not look at the impacts to roadways running in a north-south direction or otherwise outside the corridor. As indicated, these roadways would also be affected by the increase in density at the transit locations. (0421, 0421-A –7)

Response: *The commenter is correct that the effects of the density bonuses in Loudoun County were not included as part of the traffic analysis conducted for the secondary and cumulative effects section in Chapter 9, due to the limited information available on the potential location of development and construction of supporting roadway network. The commenter also notes that the growth projected under the No-Build Alternative may not occur due to traffic congestion. Finally, the mitigation does focus primarily on localized congestion at the transit station areas. Many of the north-south roadways that provide access to the corridor, including Route 123, Route 7, I-66, Reston Parkway, Route 28, Loudoun County Parkway, and the Capital Beltway have improvements scheduled or in planning stages designed to meet projected increases in demand by 2025 as part of the regional planning process. The Final EIS incorporated information from the regionally adopted land use projections prepared by MWCOG, Round 6.3 that do indicate strong growth trends in the corridor, even under congested conditions.*

Build on Fairfax and Loudoun County Comprehensive Plans

State Comment: Likewise, future planning needs to build upon the pioneering work already completed in Fairfax and Loudoun counties to amend their comprehensive plans. That planning calls for rail stations with maximum access and flexibility for riders and transit-oriented development around the stations. (0131, 0163-T –9)

> ***Response:*** *The change in development character in the corridor is discussed in Chapter 5 of the Final EIS. The land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will work with the local government to support access to transit stations for pedestrians and cyclists and to implement transit-oriented development initiatives, although implementation of this form of development, including the provision of bike lanes, parking regulations, and demand management measures is under the jurisdiction of the local government in the area. The stations proposed as part of the LPA are designed to provide access to pedestrians, cyclists, and feeder bus services, as well as transit-oriented development that might be implemented in proximity to the stations.*

Conduct Engineering Studies to Analyze Potential Air Rights Development

State Comment: Another major reason for our support of rail in the corridor is the opportunity it provides to use transient-oriented development to create attractive neighborhoods and communities with a pedestrian focus, the kind of planning that has made much of Reston a model of community scale development for the rest of the world. Transit-oriented development provides opportunities to develop a variety of housing types for an increasingly diverse population and to reduce household expenditures on transportation. A well-planned and mixed use in close proximity to the station is the key to generating rail ridership. To optimize ridership, we urge that the engineering studies for the station take into account the potential for air rights development as well. (0131, 0131-T –5)

> ***Response:*** *Higher density at station areas triggered by implementation of the LPA will open up opportunities for joint development, including opportunities for air rights development above transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local government.*
>
> *With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Preserve Air Rights Options at Reston Parkway/Route 772 Stations

State Comment: There was considerable support for air rights development at rail station areas. We request that the project team take a pro-active approach to ensure that this can be accomplished easily, without the need to reconstruct station platforms, in particular at the Reston Parkway and Route 772 stations. (0131, 0434-E –2)

> ***Response****: With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators. .*

Local Agency Comments

Coordinate Metrorail Extension with Land Use in Tysons Corner

Local Comment: It would be a tragic lost opportunity if we do not innovatively attempt to coordinate and integrate land use with the extension of metro to Tysons Corner. By partnering with all stakeholders we have an opportunity to preserve and improve the existing success of Tysons Corner resulting in the improvement of traffic circulation and creating pedestrian friendly civic space where none now exists. (0130, 0308-L –3)

> ***Response:*** *The change in development character in Tysons is discussed in Chapter 5 of the Final EIS. The analysis in the Final EIS addresses potential development within Tysons Corner at the transit station areas associated with the LPA. Station plans presented in the General Plans do not preclude joint development; however, no specific provisions have been made to accommodate it. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.*

Will Stations Be Urban Villages

Local Comment: Will each station constitute an urban village and destination in its own right, with both residents and office workers able to walk to a full spectrum of retail and commercial services needed to meet their daily needs? (0151, 0297-E –11)

> ***Response:*** *As stated in Chapter 3 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.*

Smart Growth Strategies at the Route 606 and 772 Stations

Local Comment: A major element of this Smart Growth strategy is the Dulles Corridor rail project, and our land use policies are specifically structured to maximize the benefits and the opportunities presented by the Dulles corridor rail project stations at both Route 606 and 772. (0240, 0240-T –1)

> ***Response:*** *The change in development character in the corridor is discussed in Chapter 5 of the Final EIS and quantified in Section 5.3. The analysis in the Final EIS addresses potential development at the proposed transit station areas. As stated in Section 5.2 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be the goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.*

Encourage DRPT/WMATA to Integrate Parking and Mixed Use Development

Local Comment: I strongly encourage and would fully support DRPT / WMATA to think outside the box by seriously looking at alternative design opportunities to integrate ample parking for metro with mixed-use development on and around this future metro station. To achieve that end, I encourage DRPT / WMATA to work with the development community to explore creative ways to fully take advantage of all the opportunities that future rail stations would provide. The public investment in the extension of Metro is too great to ignore opportunities to maximize that investment. (0130, 0308-L –2)

> ***Response:*** *As stated in Chapter 5 of the Final EIS the land use plans adopted by local government within the Dulles Corridor all contain guidelines for mixed-use development and walkable, bike-friendly development patterns in proximity to the transit stations. Parking is provided at several stations in the corridor as part of the LPA. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering.*

Preserve Future Options for Air Rights at Rail Stations

Local Comment: Maintain implementation options for rail that do not preclude addressing the issues of air rights. (0437, 0437-E –12)

> ***Response****: With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Public Comments

Work with Loudoun and Fairfax Counties on Station Parking Facilities

Public Comment: DCRA recommends additional planning work be done with Loudoun and Fairfax Counties on the size, location and design of station parking facilities. There are significant opportunities for mixed-use, transit-oriented development (TOD) at most of the stations and several joint development opportunities. As the Draft EIS analyses indicate, well planned TOD is an important generator of ridership. Any parking planned for the stations should be integrated with TOD. As the counties encourage TOD, transit planners should study the impact of providing more feeder bus service to reduce the need for parking at stations. By reducing vehicle trips, feeder bus service supports efforts to reduce harmful vehicle emissions and improve air quality. (0131, 0434-E –5)

> ***Response: Chapter 5*** *of the Final EIS discusses potential transit-oriented development at the proposed transit station areas. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. However, all land use decisions are under the jurisdiction of local government. All stations have been designed to provide access to development in the vicinity of the station for riders, residents, employees, and visitors.*

BRT Not Effective for Encouraging Higher Densities

Public Comment: Fairfax and Loudoun County Comprehensive Plans allow for higher densities within walking distance of proposed rail stations. Without rail, however, the densities around proposed stations

will not be triggered in county plans and the option for a cost-effective rail replacement of BRT in the future will be gone, leaving no attractive alternative to increasing levels of highway congestion. Consequently, BRT as proposed in the Draft EIS, is not an effective stepping-stone to rail, as its use for any length of time would cause the Corridor to develop at densities which are too low to support a rail system, yet too high for the Corridor's projected highway capacity. (0133, 0405- L-11)

> ***Response:*** *BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Density bonuses associated with a BRT Alternative in Fairfax County were evaluated in Chapter 5 of the Draft EIS. , The densities are higher with the LPA, the Metrorail Extension, through the core of Tysons Corner. The language in the comprehensive plan would have limited development even under the BRT Alternative if highway capacity could not have accommodated the projected growth.*

Recommendations for Mixed-Use Air Rights Development

Public Comment: WATF members have examined the potential for mixed-use Air Rights developments above transit stops in the Dulles Corridor. The feasibility of using air rights above appropriate points in the corridor and at Tysons Corner would be driven by civic planning and economic considerations as well as by market forces. The conceptual illustration for a "Ponte Nova" mixed-use development above the proposed Reston Town Center station forms Figure 2. Its purpose is to demonstrate the seriousness with which the air rights concept should be considered and to stimulate a dialogue of civic and governmental interests regarding the future use of air rights. The conceptual work indicated the following potential benefits from such developments as they become economically feasible:

a) Expanded ridership revenue for the proposed transit system, (and thus reduced subsidy) as well as increased Fairfax County revenues through fees in lieu of real estate taxes;
b) Greatly improved integration of the transit stop with surrounding land uses;
c) "Bridging" the Dulles Corridor, thus linking land uses on either side visually, as well as for pedestrian, bicycle and vehicular traffic.

The conceptual analysis indicated that a "Ponte Nova" type development should voluntarily comply with the Fairfax County planning process, should blend with appropriate community standards, in this case those of Reston, and need not be visually intrusive to neighboring residential communities. Air Rights proposals would require agreement from Fairfax County and the Metropolitan Washington Airports Authority, and should be developed in consultation with neighboring communities. In that respect, the WATF notes that Fairfax County's land use planning process, Supervisor Hudgins' Charrette, and public comment opportunities already have produced a considerable volume of suggestions favoring Air Rights, to which this concept responds. The WATF believes that Air Rights developments could become economically feasible within the next five years and strongly recommends that:

a) The EIS Record of Decision includes the ability to create Air Rights developments above stations;
b) Detailed station design at appropriate locations should consider the potential for an Air Rights development. Where the feasibility for such developments would be in the future, the provision for them should be retained in station design.

Requested Action: Include use of Air Rights and other ridership building initiatives in the preferred local alternative. (0133, 0405-L –5)

Public Comment: Whether or not the above ground or partially below ground options are selected for Tysons Corner is a function of the ability to integrate the above ground option into Tysons Corner's environment in a visually appealing manner. Air Rights concepts for example could be used to "bridge" portions of Route 123 and Route 7 in the vicinity of stations. (0133, 0405- L-9)

> ***Response****: With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that VDOT as the owner and operator of the Routes 7 and 123, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of VDOT. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering.*

Integrate Station Design, Land Use, and Air Rights

Public Comment: The rail station should be integrated with land use in order to increase ridership and reduce the subsidy burden on the region's taxpayers. The lack of parking at Route 772 and the location of parking at Route 606 are examples of the many refinements required during the design phase. Consequently, we believe that the final EIS should be written so that the record of decision gives the designer the maximum flexibility for this integration with land use including the use of air rights above stations, adequate parking, and use of covered moving sidewalks or other devices to extend the reach of stations in appropriate locations. (0133, 0133-T –5)

Public Comment: The EIS should be written so that the Record of Decision gives the designer the maximum flexibility for this integration with land use including use of air rights above stations, adequate parking and use of covered moving sidewalks or other devices, to extend the reach of stations in some locations. (0133, 0221-M –5)

> ***Response:*** *Proposed park-and-ride facilities were the subject of on-going coordination with Loudoun and Fairfax counties during completion of the Final EIS. Station designs do not preclude construction of additional parking or conveying systems by others outside the station entrances.*
>
> *With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering.*

Questions about Future Development around Station Areas

Public Comment: How much of the projected commercial and residential growth in the corridor can be accommodated by denser development around the metro stations? How many people currently live or work within the quarter mile walking distance of the proposed bus or rail stations? How exactly are people like those working in the Reston Town Center or Herndon Town Center to get to the bus-rail platforms in the median strip? Will the stations become a focal point of a mix of residential and commercial development? Will the areas around the station be pedestrian-friendly? Will each station, in short, constitute an urban village and a destination in its own right, with both residents and office workers able to walk to a full spectrum of retail and commercial services needed to meet their daily needs? (0151, 0151-T –6)

Public Comment: The Fairfax County Board of Supervisors last year attempted at least a partial solution to these issues by approving measures to encourage denser development around the Metro stations. We applaud the goal, but did they go far enough? In fact, those measures raise an intriguing question: Are we extending Metro to deal with growth in the corridor, or are we promoting growth in order to justify the extension of Metro? How much of the projected commercial and residential growth in the corridor can be accommodated by denser development around the Metro stations? How many people currently live or work within a quarter mile walking distance of the proposed bus or rail stations? How, exactly, are people-- like those working in the Reston and Herndon Town Centers-- to get to the bus/rail platforms in the median strip? (0151, 0297-E –8)

Public Comment: Will the stations become a focal point of a mix of residential and commercial development? (0151, 0297-E –9)

> ***Response:*** *The level of projected commercial and residential growth in the corridor was presented in Chapter 5 of the Draft EIS and varied by BRT or Metrorail alternative, and by the various alignments. Each station area presented in the Draft EIS specified development levels*

within half-mile distances. This is the average maximum distance patrons will generally walk to transit stations, and this distance is consistent with the radii used by Fairfax and Loudoun counties to define transit station areas. The projected levels of growth associated with the Wiehle Avenue Extension and the full LPA were refined in Chapter 5 of the Final EIS.

As stated in the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns near the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.

Design Options for the Tysons West Station Parking Facilities

Public Comment: However, if it is concluded that a commuter-parking garage is a necessary component to the Tysons West station, we suggest that there are other design alternatives that would make this commuter facility blend in better with other transit related mixed-use development. For example, if the 2,000-car requirement were spread out over several sites as opposed to being massed on one site, it would allow for better distribution of commuter parking spaces and an ability of the property owners to absorb this commuter-parking requirement as part of their private development. This essentially would result in a joint development effort of public parking and private parking to support a private transit related mixed-use development. We have commissioned studies of how the commuter parking could be integrated into proposed development plans for the 22 acres and find that it could be accommodated without requiring WMATA's acquisition of the Security Storage and Templeton Oldsmobile sites. (0400, 0400- L-3)

Response: *The proposed facilities cited in the comment do not preclude transit-oriented development at this station, or limit pedestrian access to it. The parking facility is set back from Route 7 to provide space for development by others as well as screening for the parking structure. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.*

Concern Over Aerial BRT Bridge at Tysons West Station

Public Comment: This aerial BRT bridge also would create a barrier separating the properties on either side, both physical and psychologically. Redevelopment of the Tysons West station area would be less likely to occur in a comprehensive fashion with the introduction of this pedestrian unfriendly design. Instead, it will create a division that, depending on which side of the proverbial "tracks" one's property lies, may never be bridged. (0135, 0391-L –6)

Response: *No barrier effects were identified for the BRT ramp at this location during preparation of the Draft EIS. The land uses associated with parcels in this area were shown in Figure 4-14 of the Economics and Secondary Development Effects Technical Report (June 2002). Existing and future uses on both sides of the bridge are industrial in character. BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS.*

Desire a Transit-Oriented Village at Tysons West Station

Public Comment: Tysons West Station. Since DCRA supports a full rail extension out the corridor, we do not support the Tysons West station at Route 7 and Tyco Road serving as a transfer station between Bus Rapid Transit and rail, nor do we see it as an end of the line station for anything but a brief construction-staging phase. We wrote to the project team earlier in the process that the Comprehensive Plan for Fairfax County envisioned mixed use at this location, not a major parking facility. This site of more than 50 acres under joint ownership represents a significant opportunity to create a true transit-oriented village in Tysons Corner. By going directly to rail and limiting the amount of parking to be provided, this opportunity can be enhanced. Fairfax County has much to gain in securing quality development and enhancing tax revenues by encouraging high-quality mixed-use development at this site. The analysis done for secondary development-related travel effects in the "Traffic Analysis and Station Access Study-Technical Report" shows that the rail transit system could benefit far more from and allowable increase in mixed-use densities adjacent to the stations than from the provision of large parking garages. While it may make sense to provide some station parking at the particular location, it should be drastically scaled back and integrated into the transit oriented development plan. (0141, 0443-E –6)

> ***Response:*** *The Project Team recognizes the importance of residential and commercial development in proximity to station areas. However, it should be noted that the existing and planned uses in this area are industrial. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.*

Address Tysons Corner Future Development through Transit and Land Use

Public Comment: We have got to fix Tysons Corner with the continued development that is coming to Tysons, and it cannot just include transit, but the pedestrian-friendly design, housing, right mix of uses and the right street connections. (0149, 0149-T –3)

> ***Response:*** *As stated in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.*

Impact of Tysons West Parking Garage on Future Station Area Development

Public Comment: There was concern expressed at the 7/29/02 hearing that the 2,000 space parking garage at the proposed Tysons West station would limit development around that station along Rt. 7. If we use some imagination, we should be able to get some developer(s) to build the garage with an office or residential building placed above the garage. (0071, 0071-CC-1)

> ***Response:*** *The Project Team recognizes the importance of residential and commercial development in proximity to station areas. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under*

the jurisdiction of local government. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.

Impact of Tysons West Parking Garage on Pedestrian Access and Transit-Oriented Development

Public Comment: Even if the aerial bridge for the BRT service is relocated slightly to the east to avoid the TMS Property (something the DEIS consultants indicated they had not considered), the proposed 2,000-car parking garage and related facilities at the Tysons West transit station would still substantially affect operations at Tysons Self Storage and the potential for transit-oriented, pedestrian-friendly redevelopment. Indeed, construction of a multi-story, 2,000 car parking garage will create a physical separation between and among the properties around the proposed Tysons West transit station and diminish the opportunities for transit-oriented redevelopment around the station. The increased walking distances that will be created by forcing employees or residents to walk through or past a commuter parking garage to reach the transit station also are likely to discourage many people from utilizing mass transit. Placing a multi-storied parking structure in the path of pedestrians attempting to access a new transit station appears to contradict Fairfax County's goal of creating a pedestrian-friendly environment in Tysons Corner. (0135, 0391-L –14)

Public Comment: If a parking garage is necessary near the Tysons West Station, careful consideration should be given to the location and design of the garage. The garage should not provide a structural and visual barrier between the station and the parcels to the east. Any parking facilities should be integrated into a mixed-use development to ensure that it is appropriately screened and provides retail, office and residential uses, as well as parking, to allow the garage to become an integral part of a vibrant 24-hour Tysons Corner community. To this end, the parking facility should be potentially eliminating many of the aesthetic and physical concerns with the structure. Otherwise, if the parking facilities are constructed as a stand-alone endeavor, achieving the County's goal of pedestrian-friendly, transit-oriented joint development will be a substantial, if not impossible, challenge. (0135, 0391-L –17)

Public Comment: However, the Owners do have concerns over the specific facility designs for the Tysons [West] rail station. All Metrorail alternatives and the BRT alternative in the Draft Environmental Impact Statement propose that a 2,000-car commuter-parking garage be located on the Security Storage and Templeton Oldsmobile sites. This large structure would occupy one of the key redevelopment sites at the Tysons West Station and is a major concern to the Owners. We suggest that a commuter parking garage of this magnitude is not appropriate for this area. Tysons Corner is viewed as the "downtown" of Fairfax County and, as such, rail service should be planned to implement that vision. Attracting commuters into Tysons Corner so that they may park and use Metrorail to reach other destinations such as Washington, DC, Arlington or Dulles Airport seems contrary to the Tysons Corner Comprehensive Plan. This station area should be planned so as to maximize the number of residents and workers within walking distance of the station. Not only will this garage occupy one of the "100% corners" at the Tysons West station, it will also impede pedestrian flow from adjacent property north and west of the station area. We suggest that this commuter garage be relocated to another station outside of the Tysons Corner area and allow the Tysons Corner stations to function in a more urban not suburban design. (0400, 0400- L-2)

Public Comment: The Reston community does strongly support efforts to strengthen the bonds between the north side of the Dulles Corridor and the south side, and at a minimum nothing in the development of transit in the Dulles Corridor should in any way inhibit what might be done in the future to broaden the linkage. A number of proposals are possible. Some day they will be economically feasible, but that's a four to five hundred foot gap that we must somehow bridge more effectively. (0088, 0172-T–4)

Public Comment: The Reston Community strongly supports efforts to strengthen the bonds between areas of the community to the north and areas to the south of the Dulles transportation corridor. Special sensitivity is essential in the design of Reston and all other transit stations to encourage a bridging of the 400+ foot right of way of the Dulles Corridor. (0088, 0211-M –8)

Response: *The implementation of the Wiehle Avenue Extension or the full LPA proposed in the Final EIS would provide connections to both the north and south side of the Dulles Toll Road.*

Pedestrian bridges from both the north and south sides of the Dulles Toll Road are included as part of the station design. None of the proposed improvements are anticipated to preclude the ability to further enhance north and south connections.

Station Access, Design and Future Development at Wiehle Avenue Station

Public Comment: One of the things that Reston seeks to - some of the issues in Reston are access to the transit stations, the kind of development that will occur around the transit stations, the opportunity to do some joint development, because there is a parking facility at Wiehle Avenue that can be redeveloped as a nice transit-oriented village type project, and also because of the air rights possibilities that can link Reston north and south and east and west. (0141, 0167-T –1)

Response: *As discussed in Chapter 5 of the Final EIS, the local governments' land use regulations supporting transit-oriented development have been summarized in relation to the project as an evaluation of the potential change in development characteristics at the transit station areas. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local governments.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which will advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.

With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.

Need to Recognize Recommendations of the Reston Charette

Public Comment: Summary: The DEIS provides analysis for a Dulles Corridor Extension developed to serve those who drive. With this as the foundation we will build a Reston that is a better place to park, not a better place to live. The DEIS proposes investment that does not contribute to the historical and architectural context of the Washington Metropolitan Area and Reston. I support rail, but only if the County, the Project Team and all of those involved in the project work together to do all the things that should be done regarding housing, air-space development, community-friendly around the stations, and some consideration of the historic context of Reston. There was a strong consensus on these items as a result of the Reston Charrette. The DEIS gives brief recognition to the desires of the community and then ignores those desires. By 2020 we will see metro stations that parallel the "improvements" at Dulles Airport in both cost and appearance: A $3.5 Billion parking garage. (0209, 0209-M –7)

Response*: The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which will advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a

starting point, the committee is establishing the process, scope and criteria for the RFP.

If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering. The implementation of local land use regulations around the stations is under the control of the local government, and those that are approved are considered in the Final EIS. Proposed parking facilities at Wiehle Avenue and the Herndon-Monroe station, are expansion of pre-existing Fairfax County facilities. No park-and-ride facilities are proposed at the Reston Parkway Station since it is planned to serve as a destination station.

With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.

Quantity Benefits of Transit at Reston-Area Stations

Public Comment: The last thing I would suggest is that I have not yet heard any presentation on the benefit that we are going to receive to reconnecting Reston with what we can do with the uses that can go around the stations and the connections that can be built around it, and those should be quantified so that we can demonstrate the value that we have gained from this major investment. (0171, 0171-T –4)

Response: *The change in development character in the corridor is discussed in Chapter 5 of the Final EIS.*

Consistency of Station Design with Local Land Use Plans

Public Comment: Urban Design: The proposed alternatives for either the north or south station do not propose destination activities for mixed-use associated with the County's comprehensive plan or results of the land use charrette for the property. Flexibility should be included in the final EIS recommendations for the area adjacent to the platform to increase usage at the station. We understand that the design of the transit circulation system outside of the station platform can be refined through future design, so we hope that design is integrated into the surrounding land use plans. (0451, 0451-L –5)

Response: *The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering and/or final design.*

Need to Recognize Plans for the Comstock Property

Public Comment: The Comstock property, known as "Loudoun Station", is identified as Loudoun County Tax Map 79 ((2)), parcels 1, 2, 1TR, 2TR, and is proposed to be developed with a mix of uses oriented toward the rail platform. We have a pending rezoning application with Loudoun County, referenced as ZMAP 2002-0005, seeking to have the Loudoun Station property rezoned to the PD-TRC (Planned Development-Transit Related Center), the appropriate district for implementing the Loudoun County transit-related polices. (0014, 0014-L –1)

Response: *Comment noted. Current land use policy decisions are reflected in the Final EIS.*

Design Route 772 Station Area to Allow For Transit-Oriented Development

Public Comment: We respectfully submit that it is vitally important that the land planning and transit-related proposals included herein be given full consideration by WMATA [and] VDRPT in order to ensure that the Route 772 Station Area is designed to meet both WMATA standards and the Loudoun County TOD policies. The economic viability of the Dulles Rail project is directly hinged upon the implementation of sound transit-related development policies that can only be achieved through modifications in the DEIS. (0014, 0014-L –2)

Public Comment: We would respectively suggest that the DEIS of the Dulles Corridor Rapid Transit Project be amended so as to recommend that the Metrorail Alternative and that full consideration be given for bus and rail facilities and pedestrian access on both sides of the Dulles Greenway right-of-way in the vicinity of the Route 772 area. (0014, 0014-L –15)

> ***Response:*** *The Final EIS reflects the transit oriented development policies as defined by the Loudoun County General Plan at Route 772. The permitted uses, land use mixes allowed, and density provisions are incorporated into the analysis of the growth that might occur in the vicinity of the Route 772 Station. The Final EIS and final General Plans incorporate~~s~~ pedestrian access from the Metrorail station to both sides of the Greenway. The Project Team will continue to coordinate this access with adjacent developments with approved site plans.*
>
> *The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local governments.*

Loudoun County Plans for Transit-Oriented Development

Public Comment: Loudoun has been planning for the coming of rail transit to the Greenway corridor for the last decade. Just last July, 2001, the Loudoun County board adopted a comprehensive plan that sought to enhance TOD development around its transit stations. This work seems to be bearing fruit. I understand that there are three TOD development proposals in various stages for these future stations. (0141, 0443-E –3)

> ***Response:*** *Comment noted. The Final EIS documents major projects that are planned for station areas in Loudoun County. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local governments.*

Relocation of Route 606 Station Inconsistent with Goal 3

Public Comment: The Goals and Objectives of the Project are set out in the DEIS, at page 1-27.Goal 3, Support Future Development. By relocating the [Route 606] rail station away from where it was placed in the MIS, Goal 3 is greatly defeated. Millions of square feet of development stand to be made much less pedestrian friendly by moving the station more deeply into Dulles Airport. Also, at the MIS location, an entrance into the possible P&R lot adjoining Area #3 of Dulles Gateway can be readily provided. The DEIS location makes that impractical, if not impossible. This is vitally important, because the opportunity for over 1,000 surface spaces stands to be lost. (0248, 0447-L –4)

> ***Response:*** *Dulles Gateway Associates, L.L.C. and TAB I Associates, L.L.C., the owner and developer of undeveloped property to the north of the Route 606 Station and the Dulles Greenway, has commented on the Route 606 Station location, access and facilities during the two public comment periods for the Draft EIS and Supplemental Draft EIS and during several*

coordination meetings with the Project Team. In this Chapter 2 of Appendix J, his comments appear under the commenter identification number 0248 for the Draft EIS and its proposed General Plans (June 2002) and under number 0111 for the Supplemental Draft EIS and revised General Plans. For the comment period of the Draft EIS, the owner-developer submitted a February 3, 1994 plan titled "Transit Station Site 5-A, Dulles Toll Road Corridor". For the comment period of the Supplemental Draft EIS, the owner-developer submitted a technical report by his consultant, titled 'Route 606 Station and Parking Analysis' (December 2003), on alternatives for the Station's park-and-ride structure and other facilities.

With his comments on the proposed General Plans (June 2002) the owner-developer submitted an undated development site plan titled "Dulles Gateway North, Sterling Virginia - Antigone Properties" prepared by Leo A Daly. The site plan shows two major developments that are separated by the stream valley and flood plain of Broad Run. Loudoun County in its revisions to its General Plan (County's name for its comprehensive land use plan) designates the area north of the Greenway, east of Broad Run and one-half mile north of the Route 606 station as appropriate for consideration of a transit node, Transit-Related Employment Center (TREC). Specific location of the TREC will be determined when a development proposal is made that complies with the policies and criteria specified in the plan. The owner-developer has not yet submitted his proposal to Loudoun County for review and approval. The owner-developer has identified the development east of Broad Run as Area 1 and west of Broad Run as Area 2. In addition, the owner-development has a land-locked parcel south of the Dulles Greenway and Broad Run and north of Route 606, which he has designated as Area 3. The route from Route 606 to the station facilities is via the existing Route 789.

Station Location
The location of the Route 606 Station in the final General Plans is west of the Route 606 overpass of the Dulles Greenway. The Greenway was planned, designed and constructed with a section of wide median to accommodate the future station. The Project Team's design in the final General Plans reveals that the width of median is not sufficient and, therefore, a westbound section of the Greenway must be moderately shifted outward from the median.

The Route 606 Station has its facilities of bus bays, Kiss & Ride and park-and-ride structure north of the Dulles Greenway on Airport property. North of the station facilities is the Area 1 TREC development.

The station location in the proposed General Plans (June 2002*), revised* General Plans (October 2003) *and the final General Plans differs from the station location that DRPT had identified in its* Dulles Corridor Transportation Study (June 1997)*. The study has been also known by its Federal definition, Major Investment Study or MIS. During the preparation of the proposed* General Plans (June 2002), *the Team shifted the station approximately 400 feet eastward or inbound from its MIS location for three reasons:*

1) *to minimize the height and extent of Station's retaining walls and fill,*
2) *to avoid potential impacts to the existing Dulles Greenway bridges over Broad Run, and*
3) *to avoid impacts to the horizontal clearances between the eastbound lanes of the Dulles Greenway and the southern abutment of the Route 606.*

The owner-developer has consistently commented in the two public comment periods and requested in several coordination meetings with the Project Team that the Route 606 Station be restored to a location that he believes is the one identified in the MIS.

For the coordination meetings and for the Public Hearings Report (February 2004), the Project Team prepared Figure J.2-1 in order to depict the General Plans location versus the MIS location of the Route 606 Station. But, the MIS location differed from the location that the owner-developer believes is the one identified in the MIS. His location is approximately 700 feet further west or outbound from the General Plans location.

In the comparison of the General Plans and MIS locations of the Route 606 Station, the pedestrian bridge between the station and the station facilities (park-and-ride structure, bus bays, and Kiss & Ride) remains in the same location. The travel path from the platform to pedestrian bridge to the station facilities is aligned for extension to a proposed transit node and TREC. The Project Team will be coordinating with the owner-developer so that this pedestrian link will be efficient and attractive.

In his comments, the owner-developer has requested a shift of the station and a second pedestrian bridge and station entrance to serve the development west of Broad Run. WMATA and industry standards assume that one-quarter mile is a reasonable walking distance, and one-half mile represents the outer limit of distance that most persons will choose to walk. Most of the Area 1 development is within one-half mile of the center of either the MIS or final General Plans station location, and could be accessed through the station facilities to the north (as noted above). Conversely, none of Area 2 development is within one-quarter mile of either platform location, and only a small portion is within one-half mile. The Project Team utilizes the WMATA study Development Related Ridership Survey II (December 1989) *as a reference for the determination of ridership by development type and distance. It revealed that the walk mode share decreases by 0.76 percent for each 100-foot increase in distance from the station. The additional rail transit trips by walk mode to and from the Area 2 development would, therefore, be negligible due to the prohibitively long walk distance.*

The sketch plan and profile submitted with the comments would move a large portion of the platform below grade, increasing construction costs, and increasing the distance from the platform to the mezzanine and pedestrian bridge level, which still must clear the Dulles Greenway below. Since the capital and operating costs of a second station entrance are significant and the additional ridership and revenues negligible, the Project Team declined this suggestion, as it previously did in a coordination meeting with the owner-developer. The economical solution for access from the Area 2 development west of Broad Run should be private shuttle buses, for which the Project Team would provide spaces at the station facilities.

Park-and-Ride Alternatives

The owner-developer in his comments on the Draft EIS and proposed General Plans encouraged the reduction of the 4,750 park-and-ride spaces at Route 606 Station. In the Supplemental Draft EIS, the Project Team proposed, later recommended, and the decision-makers selected a reduction to 2,750 spaces.

In his February 1994 plan and his December 2003 technical report, the owner-developer suggests that the Project Team consider the reduction of capital costs by the use of a surface park-and-ride facility in lieu of a structured one for the Route 606 Station. He also suggests the relocation and reconfiguration of the park-and-ride facilities by using Airport property north and south of the Dulles Greenway and using Area 3 of his ownership.

The Project Team discourages the separation of station facilities, particularly those of moderate size. If there were two park-and-ride facilities, totaling 2,000 spaces, a park-and-ride customer of Metrorail would not readily and conveniently reach one facility if the other became full first. The Project Team also discourages the separation of the station bus and Kiss & Ride facilities from the Area 1 TREC development, since there can be intermodal transfer and direct connections between the station facilities and the TREC development.

Interchange Modifications

The owner-developer has consistently commented in the two public comment periods and requested in several coordination meetings with the Project Team that the eastbound exit ramp of the interchange between the Dulles Greenway and Route 606 be modified in order to serve the alternative park-and-ride facilities south of the Greenway.

Through its travel demand forecasting and traffic analysis, the Project Team has shown that Project does not necessitate improvements to the interchange between the Dulles Greenway and Route 606. The traffic analysis in support of the Final EIS reveals that the intersection of Route 606 and Route 789 will degrade from Level of Service B in the current year to Level of Service F in the Project's forecast year of 2025, in the No-Build Alternative, that is, without the Project, due to the forecast land use. Level of service at an intersection is measured by the delay in seconds for drivers traversing the intersection. In the opening year of 2015 and in forecast year of 2025, the Full LPA increases the delay. The Project's mitigation for the opening year of 2015 is the addition of a right turn lane from southbound Route 789 to westbound Route 606. As shared with other stakeholders in the Dulles Corridor, the Project Team notes that the traffic conditions of station access should not be a major concern to the County nor to the owner-developer. The peak activity at the station will be early on weekday mornings and the park-and-ride structure will likely be full before the local peak hour of local development. For instance, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m., while the local peak hour would be between 7:30 a.m. and 8:30 a.m.

The suggested modifications of the interchange are not in conformance with A Policy on Geometric Design of Highways and Streets (Green Book) of the American Association of State Highway and Transportation Officials (AASHTO). In particular, the modifications create an interchange between the Dulles Greenway and two crossroads and place a driveway on the eastbound exit ramp. An interchange with two crossroads (in this case, Route 606 and the development roadway) creates complex signing for the exit; moreover, the driver will have unconventional decision-points in a short length of travel. The presence of the ramp toll plaza worsens the signing, the line of sight to the decision-points and the inherent weave between the plaza and ramp terminal.

The driveway on the exit ramp violates the denial of access line established for this freeway by the owner of the Dulles Greenway. That denial of access is an integral element for safe and efficient operations of freeways.

While there are other reasons for eliminating this suggestion for modifications, one to add is that the driver, having exited the Dulles Greenway via the eastbound exit ramp and then the development roadway, will not have a clear understanding of the return to the Dulles Greenway. His orientation will be confused, unlike the exactness of the conventional exit maneuver to the primary crossroad, Route 606.

In the formulation of its Team recommendations (February and March 2004), the Project Team concluded, as it did in October and November 2002 Team recommendations, that it could not accommodate the suggested alternatives of the owner-developer.

Following the revising of the LPA and approval of the revised General Plans, the Project Team participated in a May 2004 meeting with the owner-developer, his consultants, a member of the Commonwealth Transportation Board, MWAA, TRIP II, and Loudoun County. The purpose of the meeting was to review the above issues with all interest parties. The meeting did not result in a change in the selected LPA and approved General Plans.

As stated in the final Team recommendations, the Team will continue to coordinate the pedestrian connections between the station facilities and the proposed development north of Route 606 Station.

Rezoning Property in Loudoun County, Tax Map 78

Public Comment: Through Loudoun County Office of Transportation Services (OTS) staff, we met with your staff in January 2001 to review the project status and have coordinated with the County to refine the land plans to provide a transit-oriented development at the future transit site. We are in the process of rezoning the land - designated on Loudoun County Tax Map 78 as parcel 22 (MCPI 120-38-9029), Tax

Map 92 Parcel 40 (MCPI 121-36-3578), Tax Map 42 Parcel 42 (MCPI 121-47-6616), and Tax Map 93 Parcels 1 (MCPI 120-29-7420) and Parcel 2 (MCPI 089-25-8906)- to accommodate PD-TRC land use activities consistent with the County's General Land Use Plan and the Countywide Transportation Plan (CTP), revised through July 2001. We have provided electronic versions of our filings to CTC. In December 2001, the County and representatives of the Trustees met to refine the land use plan through a charrette process, which WMATA staff were involved, to develop an updated plan which still included the dedication of land for the future transit uses. If the land is not rezoned by the Loudoun County Board of Supervisors in the Fall 2002, the Trustees will proceed with development according to the approved "by-right" subdivision plan for residential uses in the CR-1 Zoning District, which does not include dedication for the transit facilities. The existing zoning is not consistent with the County's Revised General Plan and VDRPT objectives in the Draft Environmental Impact Statement. (0451, 0451-L –3)

> ***Response:*** *Comment noted. The Project Team acknowledges participation in the ongoing coordination efforts related to this zoning application and will continue to work with Loudoun County and Trustee representatives in support of the integration of station facilities with plans for transit-oriented development. The analysis of land use impacts in the Final EIS is based on currently adopted and approved zoning and land use plans. The design of the station facilities at the Route 772 Station in the General Plans (Final EIS Volume V) accommodates the station requirements within the limits of the proposed dedication as identified to the project, but does not presuppose this dedication.*

Consider Land Use and Affordable Housing During FEIS/PE Phase

Public Comment: During the FEIS and rail PE process we need hard work on…Plans for phasing of land development and provision of affordable housing. (0173, 0213-M –10)

> ***Response***: *The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among these goals of the efforts. All land use decisions are under the jurisdiction of local governments.*

EIS Density Projections Does Not Account for Rezonings and Bonus Densities

Public Comment: Additionally, EIS density projections are based on the county's comprehensive plan and fail to account for rezonings and increased transit-related bonus densities that will undoubtedly occur along the corridor. If the optimistic EIS work trip ridership projections of 20 to 30 percent are to be believed, then the vast majority of the 70 to 80 percent remaining work trips will be by car. (0150, 0150-T –4)

> ***Response:*** *The analysis in Chapter 5 of the Draft EIS presents the potential effects of increasing densities as part of the discussion of secondary development. This analysis was included in the Draft EIS to address comments received during the public scoping process about the need to quantify the potential effects of increased density at transit station areas.*
>
> *The change in development character in the corridor is discussed in Chapter 5 of the Final EIS. The land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. Density bonuses related to transit oriented development will increase transit ridership, but the majority of the work trips will still be completed by automobile.*

Rail Will Not Influence Land Use in Dulles Corridor

Public Comment: Many of the so-called supporters of what they are calling Rail Now are utopian city planner types who think that their preferred technology of public transit will improve the quality and nature of development in this area. They ignore the fact that Metro in the Maryland I-270 corridor has not made any difference in what has been built. They also ignore the fact that the Dulles Corridor's tremendous boom in the last twenty years, which has consumed almost all the available land, happened without wasteful subsidized rail - perhaps because of it. Stated simply, the Dulles Corridor is built out. The projections in the EIS for added development due to density bonuses around rail stations are fantasies. In the future, as in the past, building densities will be dominated by the economics of on-site parking, not by nearby transit opportunities. These people also ignore the spill-over effect on their neighborhoods as commuters avoid the soon to be doubled tolls on the main highway. (0162, 0162-M –7)

> ***Response:*** *Comment noted. The analysis in Chapter 5 of the Draft EIS presented the potential effects of increasing densities as part of the discussion of secondary development. This analysis was included in the Draft EIS to address comments received during the public scoping process about the need to quantify the potential effects of increased density at transit station areas. In addition, the traffic effects of increased density are presented in the* traffic Analysis and Station Access Study Technical Report (June 2002). *Potential changes in development character in the corridor are discussed in Chapter 5.of the Final EIS.*

Use of Half-Mile Radii to Estimate Pedestrian Accessibility of Stations

Public Comment: The diagrams I saw with the circles around them, the different radii, were as the crow flies, not as people walk, and I'm afraid that those distances are much, much harder -- much longer in real life. (0066, 0254-T –2)

> ***Response:*** *The radii selected for analysis are based on the geographic distance and not actual walking distances or times. The use of the half-mile radii is consistent with the methodology requested by FTA in evaluating population and employment statistics for station areas and is also consistent with distances incorporated into the comprehensive plan language adopted in Fairfax and Loudoun counties.*

Metrorail Extension Will Cause Residential Areas to Convert to Commercial Uses

Public Comment: I would also like to note for residents out in this area that watching metro come into Arlington and to Fairfax, that so many residential areas were converted into commercial areas that people who are in residential areas now should consider whether metro will really benefit them or not. (0262, 0262-T –4)

> ***Response:*** *As stated in Chapter 3 of the Final EIS the land use plans adopted by local governments within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable bicycle-friendly development patterns near the transit stations. Any development in the corridor would be under the regulation of local jurisdictions.*

Recommend Preparing Alternate Land Use Scenarios

Public Comment: The agencies involved prepare transportation analyses with the use of transportation models, and these models incorporate a definition of the surrounding land use. There is nothing preventing you from preparing scenarios of alternate land use patterns over time to demonstrate to local planners what the result of these patterns will have on transportation factors. You should certainly work with local planners and citizens in defining what alternatives to analyze. This effort does not conflict with local land use planning; rather it simply provides your expertise to assist decision makers on these complex issues. It will constitute integration of land use and transportation planning, which is a mandate of the regional plan and it can be part of an EIS, an assurance received from Secretary Clement in a recent meeting with several environmental leaders. (0158, 0475-L –3)

Response: *The analysis in Chapter 5 of the Draft EIS presented the potential effects of increasing densities as part of the discussion of secondary development. This analysis was included in the Draft EIS to address comments received during the public scoping process about the need to quantify the potential effects of increased density at transit station areas. In addition, the traffic effects of increased density are presented in the Traffic Analysis and Station Access Study Technical Report (June 2002).*

Potential changes in development character in the corridor are discussed in Chapter 5 of the Final EIS.

Need to Ensure Careful Planning for Future Land Use

Public Comment: Since various state and local elected officials are also members of various committees, planning groups, etc. either directly or indirectly connected to the Dulles Corridor Project, and many of them favor the rail option, it behooves them to ensure there is careful planning for related land use. This should be done with an eye to not approving plans that would overwhelm whichever option is adopted and leave us where we are now. (0401, 0401- L-6)

Response: *The timing and approval of site-specific plans and implementation of land use decisions within the corridor is under the control of local government.*

Need to Plan for Transit-Oriented Mixed-Use Development in Station Areas

Public Comment: We would strongly encourage WMATA to assist Loudoun County in implementing the TOD policies set forth in its Revised General Plan by allowing for TOD development on both sides of the future median transit station. (0014, 0014-L –9)

Public Comment: We recommend that Loudoun and Fairfax counties undertake station access studies to review these parking need projections. With the right kind of mixed-use development encouraged immediately adjacent to the stations instead of single use parking garages, rail ridership can be enhanced and the number of parking spaces substantially reduced. If transit-oriented development is encouraged adjacent to the stations, cost savings from scaled-down parking could be spent on providing improved feeder bus service. Priority should be giving to walking, bicycling and feeder bus service to the stations. Any parking facilities that are provided should be integrated into mixed-use projects that provide housing and generate economic activity, ridership, and tax revenues. (0141, 0443-E –5)

Public Comment: Effective public transportation requires appropriately high density, mixed use development within easy walking distance & a walkable bike-friendly station area environment. (0066, 0066-CC-1)

Public Comment: In conjunction with the rail construction, please also initiate needed transit oriented development around the rail stops. It is time for America to return to building small towns filled with stores, homes, apartments, small offices, retirement homes, and most importantly schools. This will allow people not only to walk to work or to the Metro to get to work, but they would then be able to walk to do their errands, walk to school, and walk to their entertainment. Which will greatly decrease congestion on the roads. This would also greatly increase the sense of community, which has been lacking in America since we made an over commitment to roads and suburban sprawl. With an increased sense of connection to others through communities people's lives will be infinitely more fulfilling. (0103, 0103-E –2)

Public Comment: Planning for urban mixed-use development in the area of rail transit stations in the Dulles Corridor needs to continue to be developed and looked at. (0244, 0244-T –4)

Public Comment: I strongly support the concept of planning for intensive urban scale mixed use development within a reasonable walking distance of the rail stations. Again, the Reston charette has been referred to, and other efforts, to look at what could be done. (0088, 0172-T –3)

Public Comment: I strongly support the concept of planning for intensive, urban scale mixed use development within a reasonable walking distance of rail stations in the Dulles Corridor. This type of development should generate better utilization of the rail system by bringing more potential users within the immediate service perimeter of the system. While local land use policy is not within the direct purview of the EIS, local government emphasis upon effective land use at each station should considerably expand potential transit ridership well beyond the estimates used by the consultants to evaluate the economic feasibility of the system in the Draft EIS report. We must be mindful, however, that with greater density of development we will see a full range of associated challenges to accommodate the increased activity. Transit, highway and local government officials must be given the resources and the responsibility to assure that the additional challenges associate with a sophisticated transit system can be effectively accommodated. (0088, 0211-M –7)

Public Comment: We strongly support the concept of planning for mixed-use development that allows for significant residential, commercial, retail and public uses within a reasonable walking distance to the rail transit stations. (0204, 0247-T –5)

Public Comment: I live and work in Herndon, but I am appearing this evening as one of the two managing cotrustees of the Ruth C. Launders Marital Trust. The trust owns approximately 50 acres of undeveloped land located at the southwest quadrant of the Dulles Airport Access Road and Centerville Road, Virginia Route 657. Most of the site is within a one-half-mile radius of the proposed Route 28 transit station stop. The trust also belongs to Dulles LEADER and the Dulles Corridor Rail Association. We believe that the trust's real estate is the largest uncommitted parcel along the Dulles Toll Road. We have recently filed a zoning application to develop this site with other 2 million square feet of mixed uses, including office, retail and residential. This proposal seeks to capitalize on recent amendments to the county's master plan intended to promote the use of mass transit. This interplay of varied uses in an urban setting will encourage use of rapid transit and lessen dependence on the automobile. (0175, 0175-T –1)

Public Comment: I'd like to see the Metro here become more than a commuter rail. Let's build stations and vibrant neighborhoods around them. I'd love to take the Metro down from the last stop in Ashburn to DC to see theater at night. I'd love to take the Metro down to shop and eat at Reston Town Center, maybe even have a drink, in the evening. (0232, 0232-L –3)

Public Comment: High density mixed use development is essential within a quarter mile and half mile radii of all stations and stops. Where stations would be located in the freeway median, serious consideration should be given to decking over the freeway and building high density development on the air rights. (0066, 0254-T –1)

Public Comment: Our support for the Dulles rail project or any transit project, for that matter, has always been contingent upon having real plans to focus development within one quarter and one half mile of the transit stations in high quality, new urbanist designed communities. (0149, 0149-T –4) (0149, 0180-T –3)

Public Comment: We will optimize ridership and reduce traffic congestion if we get the mix of office, retail, residential and services right. If we have ground-floor retail, if we have offices over stores, residences over stores, good sidewalks and narrower streets, good street grids, public parks and plazas, bike lanes, extensive bike parking at the stations, reduced parking requirements for TOD buildings, transit passes and benefits and other demand management measures, and also good feeder bus service. (0149, 0180-T –9) (0149, 0205-M –2)

Public Comment: We need to consider all these plans in a holistic fashion. We need to consider transit-oriented development and walkable communities. (0181, 0181-T –10)

Public Comment: Changes to land use are also the fastest thing we can do to cut vehicles miles traveled and are critical for making transit work. (0149, 0180-T –2)

Public Comment: I think we are on track to doing it right and getting the land use to relate to rail. (0141, 0167-T –7)

Public Comment: We want to optimize ridership and reduce traffic congestion by getting the right mix of office, retail, residential, and other services. We need ground floor retail. We need offices over stores. We need residents over stores. We need good sidewalks and narrower streets. We need good street grids. We need public parks and plazas. We need bike lanes. We need extensive bike parking at the stations. We need reduced parking requirements for transit-oriented development buildings. We need transit passes and benefits and other demand management measures and absolutely need good feeder bus service to all of these stations. (0149, 0149-T –7)

Public Comment: We need ground floor retail, offices over stores, residences over stores, good sidewalks and narrower streets, good street grids, public parks and plazas, bike lanes, extensive bike parking at the stations, reduced parking requirements for transit-oriented buildings, transit passes and benefits, and other demand management measures, and good feeder bus service. (0251, 0251-T –3)

> ***Response:*** *The change in development character in the corridor is discussed in Chapter 5 of the Final EIS. The land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts.*

Support Parking Located at One-Half to Three-Quarter Mile from Stations

Public Comment: In order for the project to be successful in the near term, additional parking may be in order. However, it must not occupy the prime real estate closest to the stations. We support placement of parking from a half to 3/4 of a mile from the stations to attract riders and provide access to retail along the route to the station. This factor, which will impact ridership and the project's success, is not addressed in the DEIS. (0158, 0475-L –8) (0188, 0188-T –5) (0188, 0217-M –5)

> ***Response:*** *Stations need to accommodate multiple arrival modes, including pedestrian, bicycle, feeder bus, private shuttles, and private autos. Each is important in building and maintaining ridership, and availability of daily parking is particularly influential in attracting choice riders – those who have a car available for a trip but choose to use transit. Providing such parking within a reasonable distance of the station does not preclude transit-oriented station-area development. Mixed-use, pedestrian-oriented, compact development can be integrated with parking areas. WMATA design criteria establish the maximum acceptable distance between the station park-and-ride facilities and the station entrance to be 1,500 feet. Locating the station parking more remote than this would need to be weighed against negative impact on patronage.*
>
> *Parking is a potential element of joint development opportunities in the Town of Herndon, and at the Wiehle Avenue Station. Other parking facilities may be provided through the proffer system or as incorporated into private development proposals. The parking facilities that are currently under development or proposed for the corridor have been assessed for ridership effects in the Final EIS. The actual location and implementation of remote station parking would be under the control of the local jurisdictions that implement parking requirements as part of their local land use regulations.*

Opportunities for Mixed-Income Housing and Rebuilding Communities at Rail Stations

Public Comment: Further, there is a higher growth potential for mixed income housing near the rail station areas along the corridor. Reston Interfaith is particularly interested in this issue because the rail option provides opportunities for increased low-income housing in the vicinity of major work centers such as Tyson's Corner and Dulles Airport as well as the new ones that will be created at the proposed rail stops. (0193, 0238-M –3) (0193, 0193-T –3)

Public Comment: Some of the transit-oriented development proposals, they're not in place yet. Once again, the inner Purple Line is already going to be servicing an area that's proposed for smart growth. Smart growth should be about rebuilding existing communities, not building new ones out in the middle of a field and sending a rail line out with the hopes that people are going to use it, especially when all these supposed TODs are going to come with two-car garages, anyway. (0112, 0245-T –6)

> ***Response***: *As stated in Chapter 5 of the Final EIS, the analysis of land use effects and the change in character within the corridor is built on the currently adopted land use regulations within the corridor, which encourage the provision of transit within the Dulles Corridor and implement land use regulations that support transit. The implementation of the ultimate form of development and the decision on the appropriate location of growth is under the authority of the local governments in the area.*

Location of Structure in the DAAR Median Will Impede Station-Area Development

Public Comment: Location, location, location: a phrase used by realtors to describe the importance of this one factor in determining the value or potential value of any given property. From the beginning of the process, the locations that would best serve residents and employees have been excluded from consideration. Now we are considering locations that guarantee that there will be no development within the most important 1/8-mile of stations and no residential development within 1/4-mile of stations. We are building one mistake on top of another. (0209, 0209-M –3)

> ***Response***: *The median of the DIAAH has been studied as a location for rapid transit since that roadway was constructed and the median dedicated for that use. The level of projected commercial and residential growth in the corridor within defined transit station areas is presented in Chapter 5 of the Final EIS. The Final EIS the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will work with the local government to support access to transit stations for pedestrians and cyclists and to implement transit-oriented development initiatives, although implementation of this form of development on private land is under the jurisdiction of the local governments in the area.*

BRT May Preclude Future Smart Growth Land Use

Public Comment: If BRT is to be implemented, landowners may build non-transit-oriented development which will foreclose future smart growth. (0144, 0144-T –10)

> ***Response:*** *BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS. The form of development and implementation of any site-specific private development opportunities within the corridor is under the authority of the local governments. Elements of transit-oriented development had been incorporated into the land use regulations for Fairfax and Loudoun counties in conjunction with the provision of BRT service, but at densities below those allowed with the Metrorail Alternative. T*

Protect Nearby Open Space

Public Comment: We also support the protection of nearby open space to offset new development. (0233, 0426-M –43)

> ***Response:*** *Comment noted. As stated on page 5-18 and 5-19 of the Draft EIS, local regulations do call for the creation of plazas and landscaped environments to encourage pedestrian movements and incorporate open spaces in proximity to the transit stations.*
>
> *As stated in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts.*

Fairfax County Should Continue Work on Mixed-Use Development Policies

Public Comment: Although significant initial steps have been made by the two counties, as noted above, in adopting policies to encourage mixed-use transit-oriented development, much remains to make this a reality. Several of the recommendations above are critical in doing this. In addition, Fairfax County should continue to work on its policies and development regulations toward this end. Mixed-use development should be fostered immediately, at appropriate densities, and development plans should be required to show how development can be staged during the rail transit development process and beyond. (0478, 0484-E –23)

> ***Response:*** *Comment noted. As stated in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be the goals of the efforts. However, all land use decisions such as the provision of affordable housing and phasing of development are under the responsibility of local jurisdictions.*

Need Affordable Housing in Station Areas

Public Comment: Affordable housing should be a significant component of plans for the station areas, as now stated in the Fairfax County's Comprehensive Plan. As the station area development planning process evolves, goals should be established, with funding mechanisms, to provide housing for as high a proportion of employees of all income ranges in the station areas as feasible, in order to eliminate the maximum amount of peak period motor vehicle trips and achieve other related community development objectives. (0478, 0484-E –24)

> ***Response:*** *As discussed in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development (including diverse housing types), and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. However, all land use decisions such as the provision of affordable housing and phasing of development are under the jurisdiction of local governments.*

Consider Air Rights and Station Access in Planning Stage

Public Comment: We believe that with this project, there is an important opportunity for the County to continue to make investments in transit and transit-oriented development around metro stations. For example, station access for walking and biking should be incorporated into the planning stage. Also, air rights (or, large platforms over the stations) could be offered and maintained in the design stage for future higher density development. (0233, 0426-M –42)

> ***Response****: As described in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns within one-quarter mile and one-half mile of the transit stations. With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. However, all land use decisions such as the provision of affordable housing and phasing of development are under the jurisdiction of local government*

Do Not Encourage Increased Density at Tysons Corner

Public Comment: Following the tragedy of 9-11 I feel it is more important than ever to decentralize. Why would we build high rises to house the best minds of the people who would be working in Tysons Corner? If anything, we need to stop developing Tysons to be so dense. If computers can so easily talk to each other there is no need to concentrate its operations in one local. Now more than ever we need not to build high rises in between the flight paths of National Airport and Dulles. No more development of Tysons. Let's save the humility of the neighborhood even if saving it costs us more than developing it. That would be ok. (0052, 0052-CC-1)

> ***Response:*** *Chapter 1 of the Final EIS describes the Dulles Corridor and identifies the need for the proposed Dulles Corridor Rapid Transit Project.*

Coordinate Increased Density with Transportation Improvements

Public Comment: We are afraid that the County will zone increased density but road mitigation measures or Metrorail will be delayed or never happen. We therefore recommend approval of increased density zoning only when: Mitigation measures are actually implemented, and Funds are not only approved, but are released for the Operating Segment that includes Mid-Corridor service. Higher density facilities should be timed to coincide or follow the arrival of Metrorail and road mitigation measures. (0210, 0210-M –12)

Public Comment: Metrorail allows the highest densities at the station areas of any options, and will generate the greater ridership, but we are concerned about major congestion unless substantial mitigation efforts are made. Increased densities may appear before Metrorail service and mitigation plans are implemented. Higher density facilities should be timed to coincide with or follow the arrival of Metrorail and road mitigation measures, focusing on pedestrian friendly, transit-oriented developmental and travel demand management. (0233, 0426-M –7)

Public Comment: Increased densities may appear before metrorail service and mitigation plans are implemented. (0170, 0170-T –5)

> ***Response:*** *Potential mitigation measures associated with the proposed increase in density at transit station areas are discussed in Chapter 9 of the Final EIS. The counties have a*

mechanism to ensure that appropriate mitigation measures accompany future development through the zoning application and permitting process. Also, as described in Chapter 5, the level of development presents a full build-out analysis and local government may limit growth if their mitigation measures designed to limit the effects of increased density are not effective. Actual implementation of transit-oriented development and the timing and increase in densities is under the jurisdiction of the local governments in the area.

Support for Increased Density at Station Areas

Public Comment: The Committee for Dulles strongly supports the concept of planning for intensive, urban scale mixed use development allowing for significant residential, commercial, retail and public uses within a reasonable walking distance of the rail transit stations in the Dulles Corridor. This type of development should generate better utilization of the rail system by bringing more potential users within the immediate service perimeter of the system. While local land use policy is not within the direct purview of the EIS, local government emphasis upon effective land use at each station should considerably expand potential transit ridership well beyond the estimates used by the consultants to evaluate the economic feasibility of the system in the Draft EIS report. (0204, 0204-M –7)

Public Comment: Intensity of Development: the one factor that is a proven guarantee of success of a metro station. Rather than use the successful models of intense development near stations, the template for station design will be based on our low-density failures. (0209,0209-M –2)

Response: *As stated in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. However, all land use decisions such as the provision of affordable housing and phasing of development are under the jurisdiction of local governments.*

Focus Density Within One-Quarter Mile of Stations

Public Comment: We will optimize ridership, fare box and tax revenues through focusing the highest density within one-quarter mile of the stations, and this means considering air rights development or at least airport-style moving sidewalks to speed pedestrians to the edge of the right of way. Once again, most transit advocates and experts talk about it being important to focus the highest density within a quarter-mile walk. (0149, 0180-T –8)

Use Air Rights to Optimize Ridership, Fare Box, and Tax Revenues

Public Comment: We will optimize ridership, fare box and tax revenues through focusing as high as density. We need to consider air rights development absolutely. If you don't do air rights development, we ought to be considering some sort of moving sidewalks in air conditioning, as today demonstrates would be important, to get people to the edge of this massive right of way, if you insist on running the rail out the right of way. We don't want to repeat the problems with I-66 rail. (0149, 0149-T –6)

Response: *As described in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns within one-quarter mile and one-half mile of the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. However, all land use decisions such as the provision of affordable housing and phasing of development are under the jurisdiction of local governments.*

With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators. If a joint-development project would affect the design of the project, the technical issues would be resolved during preliminary engineering. Loudoun counties

Analysis of Density Bonuses in Draft EIS

Public Comment: The need for speed has kept me from adequately reviewing the entire draft environmental impact study for finding the information pertaining to the density bonuses which, from what I have seen, is not adequately addressed. When this study was done, were the density bonuses taken into account? If they are to be left to the county to consider after the metro is fully approved and funded, which it will not be until next November, that is an environmental impact that has not been properly assessed. (0159, 0159-T –1)

Response: *Chapter 5 of the Final EIS address potential development at the proposed transit station areas. Chapter 9 of the Final EIS presents an analysis of the potential effects of increasing densities as part of the discussion of secondary development, and quantifies the effects of implementing density bonuses in the corridor at transit station areas. This analysis was included in the Final EIS to address comments received during the public scoping process about the need to quantify the potential effects of increased density at transit station areas. The actual level of development and implementation of any site-specific private development opportunities within the corridor is under the control of the local governments.*

Impact at Increased Density in Dulles Corridor

Public Comment: The next principle is one of freedom. In the early days of the U.S., it was a man and his horse. Everybody forgets that today it's a man and a woman and a car. It is the essential element of freedom. I can go where I want when I want. And what we are trying to do in this process is tell people how they are going to get there and how they are going to live. So we are completely recharacterizing the county. We are talking about a high-density county. I lived in Bethesda when the Bethesda metro came out. I watched the Baronet Theater torn down and an entire Bethesda metro center built on top of it. I wouldn't live in Bethesda today if you paid me. And that's what is going to happen to this section of Fairfax County. So as you're watching all this growth that's going to happen and this tax base that's going to fund this hypergrowth, I am afraid that you are going to see over time a change in the demographics of the county, and you won't see the property value increase. As you see people move in and tax these additional trips, you're going to see an additional change in the character of the population and the tax base that supports it. (0191, 0191-T –5)

Response: *All local land use decisions in the corridor are under the control of local government, namely Fairfax County, the Town of Herndon, and Loudoun County. As described in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor contain guidelines to support higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. As described in Chapter 9 of the Final EIS, this transit-related development would have an induced effect on the level of density expected to occur in the corridor. In addition, increased transportation access is expected to have a corresponding positive effect on property values within the immediate vicinity (one-half mile) of the stations. The Final EIS does not estimate any changes in the relative socio-economic characteristics of the increased population that would result from the project.*

Need for More Comprehensive Analysis of Higher Density Scenarios

Public Comment: While we think the rail now concept in the DEIS has merit, we have some concerns about the DEIS and the planning it reflects. This is a complex project and in order for it to succeed, it will be necessary to consider and coordinate all the elements. This includes assuring that the kind of land use planning that will bring about the quantity and quality of development that will make the project viable occurs. We acknowledge that land use planning is a local government function and that you use the forecasts of the Council of Governments, but we think that much more can and must be done to ensure the success of this project. For example, the EIS should do a more comprehensive analysis of higher density scenarios. The density forecasts in the current DEIS do not adequately illustrate potential development. (0158, 0475-L –2)

> ***Response:*** *The analysis in the Final EIS addresses potential development at the proposed transit station areas, but does not use that growth to ensure the success of the project, as specified in the comment, but rather to develop an analysis of potential effects. Chapter 9 of the Final EIS presents an analysis of the potential effects of increasing densities as part of the discussion of secondary development, and quantifies the effects of implementing density bonuses in the corridor at transit station areas. This analysis was included in the Final EIS to address comments received during the public scoping process about the need to quantify the potential effects of increased density at transit station areas. The actual level of development and implementation of any site-specific private development opportunities within the corridor is under the control of the local governments.*

Impact of Increased Density on Wiehle Avenue Area

Public Comment: The DEIS states that the Metro Rail would result in increase density along Wiehle Avenue area of 8,201 residents and work force of 21,814 and in the Reston Parkway area 9,860 residents and work force of 28,714. Why is this increase in density necessary? Is it necessary to support heavy rail and pay the 3-1/2 billion-dollar cost to construct and maintain? (0189, 0448-E –2)

Public Comment: I also am concerned that rail stations, particularly the critical one at Wiehle Avenue, include high-density land use planning with attentiveness to pedestrian access. Currently, the intersection at Wiehle Ave. and Sunset Hills Road is a nightmare for pedestrians. (0125, 0125-E –2)

> ***Response:*** *The regionally approved land use projections prepared by the Metropolitan Washington Council of Governments (Round 6.3) were used to project growth within the corridor. Both Fairfax and Loudoun counties have adopted policies to implement transit-oriented development at stations if transit service is constructed in the corridor. These policies include density bonuses for some parcels that are in proximity to the station platforms and would allow for higher levels of mixed-use, pedestrian-friendly development than would otherwise exist without transit in the corridor. Although these policies are intended to support transit within the corridor, the increase in growth associated with these policies is not part of the project justification as stated in the purpose and need. An additional analysis of the effects of increased growth was prepared to respond to issues raised by citizens and local governments during the public scoping process. Local government controls implementation of policies that support additional growth within the corridor. The effects of these policies are analyzed to determine effects, but not to justify the selection of any particular alternative.*
>
> *As stated in Chapter 5 of the Final EIS, the local jurisdiction's land use regulations supporting transit-oriented development have been summarized in relation to the project. The land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will work with the local governments to support access to transit stations for pedestrians, and all stations have been designed to provide access for pedestrians. The intersection at Wiehle Avenue and Sunset Hills Road in Reston is located within the half-mile radius of the transit station area, but is not directly*

linked to the transit station itself. Thus, improvements to this intersection to improve pedestrian movements would be the responsibility of Fairfax County and/or the Virginia Department of Transportation.

Consider Impacts from Increased Floor Area Ratios in Station Areas

Public Comment: Analyze and accommodate impacts from the increases in floor area ratios permitted in rail station areas by the Fairfax County Comprehensive Plan, when the site is selected and programmed for design and construction. (0392, 0392-L –4)

Response: *Comment noted. The change in development character in the corridor is discussed in Chapter 5 of the Final EIS. This chapter also discusses the change in floor area ratios, referred to in the document as density bonuses.*

Station Area Development Depends on Funding for Transit

Public Comment: For Tysons Corner, the proposal is to have three to six stations. We need to understand that under our new comprehensive plan language, the proposed sites have great potential for intense development. The trigger for this development is not when the station is constructed; it is when the funding package for transit has been executed by all funding stakeholders. (0147, 0147-T –4)

Response: *The change in development character in Tysons Corner is discussed in Chapter 5 of the Final EIS. The analysis in the Final EIS addresses potential development that is within Tysons Corner at the proposed transit station areas. The form of development and implementation of any site-specific private development opportunities within the corridor is under the control of the local government.*

Do Not Increase Density to Justify Rail Option

Public Comment: The rail project should be designed to handle current and future growth in the county that will occur, regardless of the transportation capacity. This rail project should not be used to justify increased growth -- as is already being suggested. (0007, 0007-E –1)

Public Comment: I prefer just not building this at all if the density of development must be raised. (0082, 0082-CC-3)

Response: *The project is being designed with consideration of both current and future growth. The regionally approved land use projections prepared by the Metropolitan Washington Council of Governments (Round 6.3) were used to project growth within the corridor. The local governments have adopted policies to implement transit-oriented development at stations if transit service is constructed in the corridor. These policies include density bonuses for some parcels that are in proximity to the station platforms and would allow for higher levels of mixed-use, pedestrian-friendly development than would otherwise exist without transit in the corridor. Although these policies are intended to support transit within the corridor, the increase in growth associated with these policies is not part of the project justification.*

Impacts of Metrorail Alignment Options on Future Land Use

Public Comment: How many millions of square feet developed land can occur in Tysons Corner? If we select alignment T-1, which will have office, retail, hotel, industrial, institutional and residential, we could have 2.5 million square feet of development. Alignment T-6 and T-9, sing the same uses, it can add up to 3.2 million square feet of development. And alignment T-4, the uses add up to 4.4 million square of development. (0147, 0147-T –5)

Response: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments*

T1, T4 and T9 were eliminated from further consideration after the public and interagency review and comment on the Draft EIS. As studied in the Draft EIS, the level of developed land within Tysons Corner would have varied depending on the number of stations built and the provision of bonuses due to the inclusion of housing within the mix of development, as controlled in the land use regulations of Fairfax County. Information from Fairfax County indicated that the total amount of developed land, also known as build-out, varied from a three- station alignment such as T1 with a total of about 66 million square feet of development (including residential development and the use of density and housing bonuses), to a maximum of about 70 million with a six-station alignment such as T4 (including residential development and the use of density and housing bonuses). The overall amount, form of development, and implementation of any site-specific private development opportunities within the corridor is under the control of the local government. This level of analysis was prepared to allow decision makers to discern major difference in development potential among the alternatives studied in the Draft EIS. Only corridor development projections for the Wiehle Avenue Extension and the full LPA were presented in the Final EIS.

Increase Station-Area Density to Better Compete for Federal Funds

Public Comment: My concern is that I think that we have shot too low in terms of the amount of development that we are going to allow around the stations. We are going to have to compete with an awful lot of high interest people for the money that we are going to get from Federal government, and what we need is to demonstrate that we are going to get more tax improvement from the uses around the station, which means that we should consider upping the density around the stations. (0171, 0171-T –1)

Response: *The actual level of development and implementation of local land use regulations around the stations is under the control of the local government. Only those plans and regulations that are approved were considered in the Final EIS.*

Local Government Control on Future Land Use

Public Comment: How could government intervention be used to redirect and limit the location of additional businesses and housing along the corridor? (0235, 0235-E –3)

Response: *As described in Chapter 5 of the Final EIS, the land use plans adopted by local governments within the Dulles Corridor contain guidelines to support higher densities, mixed-use development, and walkable, bicycle-friendly development patterns near the transit stations.*

Rail Will Not Impact Development in Dulles Corridor

Public Comment: The fourth urban legend that somehow rail is going to magically transform into this cornucopia of extra development around rail stations, I can tell you as a professional developer that is not going to happen for two reasons. First of all, there is no land, the Dulles corridor is built out, and second, the economics of building buildings is dominated by on-site parking and transit is not going to affect that. (0184, 0184-T –5)

Response: *The growth projections used in the Final EIS are the regionally adopted land use projections as prepared by the MWCOG (Round 6.3), which indicate that the corridor is not built out, even in Reston. The recently adopted land use regulations do include the opportunity to increase new residential development in the transit station areas, that would provide additional residential development in Reston, and these regulations do encourage affordable housing in the corridor. As stated in the Final EIS, the development totals are presented as a build-out scenario in that high levels of development are Chapter 5 shows that there is still additional development opportunity within the corridor.*

Metrorail's role in encouraging development is to offer alternative means of travel and increased mobility for the Dulles Corridor. The LPA, would support the economic development goals of

Fairfax County. The Fairfax County Comprehensive Plan, states, "the interests of the County as a whole are best served by a Metrorail transit system that penetrates the [Tysons Corner] core and brings riders to the jobs and shopping that are a major part of the foundation of the County's economic well-being."

Fairfax County Chamber of Commerce Recommends Transit-Oriented Development

Public Comment: In addition, the Fairfax County Chamber of Commerce recommends that the affected jurisdictions continue to pursue joint development efforts to provide for the ancillary facilities necessary to foster the success of mass transit service in the Dulles Corridor. On behalf of the Fairfax County Chamber of Commerce and its member businesses collectively employing over 650,000 employees throughout the Washington metropolitan region, I thank you for your consideration. (0233, 0426-M –40)

Response: *Joint development opportunities are discussed in Chapter 5 of the Final EIS. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be the goals of the efforts. However, all land use decisions such as the provision of affordable housing and phasing of development are under the jurisdiction of local government.*

Concern Over Loss of Affordable Housing at McLean Commons

Public Comment: My concerns I am addressing to the local elected leaders and land-use planners: I am concerned for my neighbors who live in the McLean Commons Apartment Complex. The complex was recently bought by a developer who plans to raze these decent, affordable apartments and build a complex of luxury high-rise apartments. This would throw these people out of their homes, and in their place bring in thousands of more cars to the immediate area (for not all new residents will be car-less & rely solely on Metro). While I applaud the idea of placing high density housing near metro stations, I oppose taking away existing affordable high density housing in favor of more luxury development. Fairfax County doesn't need any more luxury anything, especially when it comes at the expense of the people who are more likely to rely on public transit. (0034, 0034-CC-2)

Public Comment: Without Metro fully operational, the proposed change in the comprehensive plan for the redevelopment of the McLean Commons should not be approved or even looked at. We do not disagree with the need for rail to Dulles airport or its need in the Route 7 corridor, but not at the expense and destruction of the commons. Let's not let the developers push more people upon us until we have an infrastructure in place. We know what is in the best interests of the developers. What is important is what is in the best interests of McLean, Pimmit Hills and Tysons residents. When the building is done, the developers go home, but we will still be here facing larger problems than we do now. And just as an aside, would you really want to live in a building that is above where a metro train goes through? (0159, 0159-T –5)

Response: *The analysis contained in the Final EIS did not incorporate any specific redevelopment plans such as the conversion of McLean Commons mentioned in the comment, or any pending development proposals for the area. Fairfax County has the control over land use decisions in relation to any proposals for McLean Commons.*

Lack of Affordable Housing in Northern Virginia

Public Comment: Solutions to social needs: In localities, such as northern Virginia, 36 hours of work are required at minimum wage to pay Fair Market Rents; this is nearly 92 percent of a full-time work week. There is no land for housing development of any sort in Reston; we are built out. There are problems with over-occupancy in Fairfax County and we are shifting the burden of commuting to those who can least afford it. (In Northern Virginia this includes teachers, police officers and nurses.) (0209, 0209-M –5)

***Response**: The growth projections used in the Final EIS are the regionally adopted land use projections as prepared by the MWCOG (Round 6.3), which indicate that the corridor is not built out, even in Reston. The recently adopted land use regulations do include the opportunity to increase new residential development in the transit station areas, that would provide additional residential development in Reston and these regulations do encourage affordable housing in the corridor. As stated in the Final EIS, the development totals are presented as a build-out scenario in that high levels of development are projected in some sections of the corridor. The development potential quantified in Chapter 5 shows that there is still additional development opportunity within the corridor.*

Apply Measures to Protect Open space in Dulles Corridor

Public Comment: Also we can apply measures to protect additional open space in the corridor in exchange for higher density in the station areas. In particular, we have often called on the state and the county to get buy-in from the rest of us and from the community by doing land exchanges. Parkland, you know, two miles from the station, in return for a developer getting air rights or development within a quarter mile of the station. (0149, 0180-T –10)

Public Comment: Finally, and I think this is very important in the Fairfax context, we need measures to protect additional open space in the corridor in exchange for higher density in the station areas. And I think Fairfax County, combined with the state, ought to staff offices that are specifically charged with doing land exchanges. Let's give the air rights away, but let's get open space protection within the same corridor at the same time. This should not be an excuse for doubling or tripling the densities, but making the density that is already planned for this corridor work better. It's the only way we're going to again reduce trips and improve. (0149, 0149-T –8)

Public Comment: Will nearby open space be protected to offset the new density? (0181, 181-T –5)

Public Comment: Finally, we need measures to protect additional open space in the corridor in exchange for higher density at the station areas. (0251, 0251-T –4)

Response:

As stated in Chapter 5 of the Final EIS, the land use plans adopted by local government within the Dulles Corridor all contain guidelines to support transit, higher densities, mixed-use development, and walkable, bike-friendly development patterns in close proximity to the transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts.

Doubt Over Fairfax County Growth Projections

Public Comment: We still believe in some fashion that Fairfax County is in a hypergrowth mode, aka the dot.com world, and I don't believe that assumption to be correct, but still we chase that master planning process as if it were true. (0191, 0191-T –3)

Public Comment: You will see flight from Fairfax County, and the last part of my presentation is on promises, and I will be among them. (0191, 0191-T –6)

***Response:** The growth projections used in the preparation of the Final EIS are the regionally adopted land use projections (Round 6.3) prepared by MWCOG.*

B. Supplemental Draft EIS Comments

Public Comments

Utilize Options for Air Rights Development at Station Areas

Public Comment: We need to take better advantage of the air rights. (0171, 0171-T –3)

Public Comment: For rail west of Tysons Corner, focusing higher density within 1/4 mile of stations is essential, & that will require either air rights development or movable sidewalks. (0066, 0066-CC-5)

Public Comment: Consider either future air rights or an underground segment ground rights through the hill between the Wiehle Avenue and Reston Parkway stations for the rail and roadways. Add drawings showing how this could be compatible with the general plans. (0170, 0170-T –13)

Public Comment: Will air rights, large platforms over stations, be offered and/or maintained for potential higher density development? That is crucial in Reston, where we have a need for linking north and south Reston better, instead of the Chinese wall that we have now. (0181, 0181-T –4)

Public Comment: We encourage project leaders to allow offering of air rights with high-rise developments on platforms above some of the stations. There is a great interest in this concept, and we need your view of how it will affect this project. It is not mentioned in the DEIS. We would like to see the Ballston station model followed, and not the Vienna station model followed. (0188, 0188-T –3)

Public Comment: We need air right development plans, both private and public, including community services, affordable housing, open spaces, pedestrian and bike facilities, et cetera. All the great ideas that came out of the Reston charette that showed that these ideas about air rights development of that type have overwhelming support among knowledgeable actively participating residents of the community. (0173, 0173-T –7)

Public Comment: Among the alternatives to be analyzed is the impact of affecting the construction of high-rise developments on platforms above some of the stations. There is great interest in this concept and we need your view of how it will affect this project. It is not mentioned in the DEIS. (0158, 0158-T –5)

Public Comment: A proposal for air rights development over the Dulles Corridor cannot be implemented as part of this phase of the extension of rail transit in the Dulles Highway median. However, at some point in the future when economic and technical considerations permit it will be possible to more effectively bond together the two halves of the Reston Community now severed by the Dulles transportation corridor. To the extent feasible the design of rail stations must further the goal of linking opposite sides of the corridor. Nothing in the designs should in any way preclude future efforts to develop air rights linkages built across the Dulles transportation corridor. (0088, 0211-M –9)

Public Comment: What our new comprehensive plan amendments do is they bring the housing and the retail, they provide incentives to build that kind of development around the transit station areas. We had a charette, again sponsored by Supervisor Hudgins, that gave the community three days to take a look at what we wanted have out there, and in the Reston community we wanted to see air rights. We wanted to see the chance to bridge that Dulles airport access road and that toll road and nip the two sides of the community together with public plazas, community facilities, maybe schools, places of higher education. So we view it as a real opportunity to create transit-oriented villages out there, kind of in the vein that Reston was originally known for, with its fine planning. (0141, 0141-T –3)

Public Comment: During the FEIS and rail PE process we need hard work on…Air-rights development plans -- both private and public (community services, affordable housing, open spaces, pedestrian and bike facilities, etc.) (0173, 0213-M –5)

Public Comment: We encourage project leaders to allow offering of "air rights" with high-rise developments on platforms above some of the stations. There is great interest in this concept and we need your view of how it will affect this project. It is not mentioned in the DEIS. We would like to see the Ballston station model followed and not the Vienna station model. (0188, 0217-M –3)

Public Comment: To me the key words from the DEIS are found on pages 5-12, 13: "Much of the land within the station area consists of the DAAR and Dulles Toll Road and cannot be developed."
This statement:

1. Ignores the most significant factor of development near stations, intensity of development within the first 1/8th mile.
2. Ignores what is true, desirable and done in communities across the country, deck parks and air-space development.
3. Ignores solutions to social needs in Fairfax County, social equity and affordable housing.
4. Ignores the potential profits and revenues of air-space development. (0209, 0209-M –1)

Public Comment: 2. Deck parks and air-space development: In communities from Boston to Seattle, deck parks and air-space development are bridging communities that have been divided for decades by Federal Highway projects. Reston is divided exactly in half by the DAAR and the Dulles Toll Road. Plans should be made now for the inevitable reunification of Reston. (0209, 0209-M –4)

Public Comment: 4. Potential profits and revenues: We are going to spend an estimated 3 Billion dollars. Where is the return on our investment? Air-space development has the potential to add thousands of jobs and millions of dollars to northern Virginia's economy. The DEIS not only ignores this potential, but worse, it will also prevent this from ever happening. (0209, 0209-M –6)

Public Comment: We will optimize ridership, fare box and tax revenues through focusing the highest density within a quarter mile of the stations, and that means considering air rights development or moving sidewalks to speed pedestrians to the edge of the right of way. (0251, 0251-T –2)

Public Comment: By 2025 we need to reserve above ground for intra-Reston traffic to maintain our quality of life around the station areas. Consider either future air rights or an underground segment ("ground rights") through the hill between the Wiehle Ave. and Reston parkway stations for the rail and roadways. Add drawings showing how this could be compatible with the General Plans. (0210, 0210-M –8)

Public Comment: Among the alternatives to be analyzed is the impact of effecting the construction of high-rise developments on platforms above some of the stations. There is great interest in this concept and we need your view of how it will affect this project. It is not mentioned in the DEIS. (0158, 0223-M –4)

> ***Response:*** *Higher density at station areas triggered by implementation of the LPA will open up opportunities for joint development, including opportunities for air rights development above transit stations. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of the local jurisdictions.*
>
> *With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Public Comment: In addition, WEST GROUP PROPERTIES LLC supports the County's plans to increase land use density in the areas surrounding the proposed Metro stations including, where

economically feasible, air-rights developments over stations and parking facilities. Such a land use policy is essential to allow the County to realize the full range of benefits that the Metro system can provide. (0233, 0426-M –47)

Public Comment: We must have the foresight and ambition to exploit the inevitable creation of very high value areas along the Dulles Corridor. These areas most particularly include Reston. I agree with the comments of other people and local organizations suggesting the inclusion of planning for air rights at the Reston station stops. Air rights at these stops are particularly practical since the existing grades will allow for the roadbeds to be simply cut so that the Reston stations could be below grade. (0441, 0441-E –2)

Public Comment: Reston will be able to develop transit-oriented villages around its stations with the kind of mix of uses and careful attention to pedestrian scale, landscaping and design elements that is found in its first village center at Lake Anne. Those of us who attended the Reston Charrette were excited about using a deck over the Dulles Toll Road to provide a pedestrian link between north and south Reston and using air rights development to create plazas and bring in some of key public uses missing in Reston such as higher education facilities, schools, satellite community services, and public performance space. (0141, 0443-E –2)

Public Comment: Among the alternatives to be analyzed is the impact of even greater density than currently allowed at station areas, especially at Tysons, Reston Parkway and Wiehle Ave. One way this density could occur at the latter two stations is to allow offering of "air rights" with high-rise developments on platforms above some of the stations. There is great interest in this concept and we need your view of how it would affect this project. It is not mentioned in the DEIS. We would like to see the Clarendon Station model and not the Vienna station model. (0158, 0475-L –4)

> ***Response****: With respect to air rights development above Metrorail stations in freeway medians and Tysons Corner, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

General Plans Do Not Help unite North and South Reston

Public Comment: The General Plans do little to help knit together north and south Reston. Future air rights must be considered. (0233, 0426-M –6)

Public Comment: The general plans do little to help knit north and south Reston together. (0170, 0170-T –4)

> ***Response****: With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be the goals of the efforts. All land use decisions are under the jurisdiction of local government. It should be noted that the need to "knit together" north and south Reston is not related to the impacts of this project, since the presence of the Dulles Toll Road between north and south Reston is part of the existing condition, and would not be a result of implementation of the LPA, within the corridor. One of the benefits of providing transit in the corridor may be to create pedestrian-friendly environments at the transit stations that can serve to enhance linkages as implemented by Fairfax County.*

Consider Recommendations from the Reston Charette

Public Comment: At the April 2002 Reston Charrette there was an overwhelming consensus that air-rights development was an essential and major component for achieving the community's vision for the station areas. Much of what came out of that charrette focused on development with primary responsibility being the public sector -- e.g., affordable housing, public open spaces, public access facilities, linkages across the Dulles highway, community uses in and around the stations, and a possible major cultural center. Private development of housing, retail, office, and other uses was also envisioned, and some private sector investigation of this potential has already been done. In order to coordinate all these potential uses, a plan and a means to achieve them should be developed. This plan should be developed to assure the creation of very transit-oriented development and reduce non-transit-oriented development throughout the corridor. The ownership and control of air-rights development needs to be defined through a cooperative effort of Fairfax County, the Airports Authority, the Dulles Corridor Rapid Transit Project, and Virginia, in cooperation with community organizations and property owners. The control of uses for air-rights development is most logically a responsibility of Fairfax County through its Comprehensive Plan, zoning, and development control processes. A task force effort involving staff, community organizations, and property owners should be initiated soon in order to assure that potential opportunities are taken advantage of as the station development process proceeds. The County should review and modify all of its regulations as they relate to air-rights development to eliminate or modify inappropriate barriers such as current parking requirements and street standards. The County should also create incentives for transferring existing development rights from other localities to the station areas in order to assure a net reduction motor vehicle trips insofar as feasible. (0478, 0484-E –16)

> ***Response****: The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be the goals of the efforts. All land use decisions are under the jurisdiction of local government.*
>
> *With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Consider Opportunities for Air Rights at Reston Stations

Public Comment: The county park and ride site provides an excellent opportunity for a joint development project in Reston. While the community needs some parking, it also envisions an urban village center at the transit station with housing and shops, as well as offices. Given the strong community support for air rights development, we also want to work with the project engineers to ensure that the design and construction of the Reston stations enables this significant development opportunity. Air rights provide the opportunity to create landscapes plazas over the Dulles Toll Road/Dulles Airport Access Road linking north and south Reston. (0141, 0443-E –8)

Public Comment: The major issues at the Reston Parkway and Wiehle Avenue stations are station access issue, transit-oriented development, air-rights, and joint development of parking and mixed use at the Wiehle Avenue station. As you know, all of the major organizations in Reston - the Reston Association, Reston Community Association, and the Greater Reston Chamber of Commerce -- support four-quadrant access to the rail stations. The recently adopted amendments to the Fairfax County Comprehensive Plan include this goal for the transit station areas. We know this will require work closely with properties owner and developers to achieve. We would like to work the project engineers and the County to adopt guidelines and develop concept plans that show how this enhanced access could be achieved. We view the coming of rail to Reston as an opportunity to knit the community together. The last thing we want to see is the stations become yet another barrier between north and south and east and west in Reston. (0141, 0443-E –7)

***Response**: Opportunities for joint development at the Wiehle Avenue Station were identified in Chapter 5 of the Final EIS. The Project Team will continue to participate in the efforts of Fairfax and Loudoun counties and of private stakeholders for the creation of transit-oriented development at the new Metrorail stations. Advanced urban design and friendly pedestrian connections will be among the goals of these efforts. All land use decisions are under the jurisdiction of local governments.*

Fairfax County Supervisor Hudgins has appointed the Wiehle Avenue Steering Committee, which will advise the County staff in the creation of a Request For Proposal (RFP) to solicit transit-oriented joint development proposals for a mixed use development of the County-owned parcel adjacent to the station. Using the conclusions from the Supervisor's Reston Charrette as a starting point, the committee is establishing the process, scope and criteria for the RFP.

With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.

Population and Employment Projections

Public Comment: The Supplemental Draft EIS provides a range of "Population increase at stations" for Phase 1 that is so extreme and wide as to be meaningless: 13%-986% (e.g., TABLE 2-2). (0068 0173-30)

***Response:** The population percentages displayed in Table 2-2 of the Supplemental Draft EIS represented the range of potential population increases at the different station areas. Additional detail regarding the station area development potential is presented in Chapter 5 of the Final EIS. These percentages represent the potential effects of the maximum development that would be permitted under current zoning regulations and allowable density bonuses with implementation of the LPA.*

Need for Funding of Transit Oriented Development

Public Comment: PEC proposes that the TODs west of Tysons be targeted for funding based on criteria of housing and employment levels that are reasonably expected to occur rather than on date certain straight-line trend projections stretching out many decades. (0115 0135-3)

***Response:** As described in Chapter 5 of the Final EIS, the regionally approved land use and population estimates developed by MWCOG (Round 6.3) were used for the No Build Alternative. The actual level of development and implementation of any site-specific development opportunities within the corridor are under the control of the local jurisdictions. The level of development projected in the Final EIS represents the maximum allowable development under current zoning regulations and allowable density bonuses with implementation of the LPA.*

Use of Air Rights Over Station

Public Comment: The use of air rights over stations, where the development would be economically feasible, would stimulate new revenue for the system and for the jurisdictions. As the project moves forward, opportunities for air rights developments should be welcomed and incorporated in station design. (0108 0127-7)

Public Comment: [Reston Association] supports the air rights concept for a deck over the Dulles corridor highways that would accommodate parking, direct access for pedestrians, bicycles, and feeder buses, and mixed-use development. (0039 0040-10)

Public Comment: [Reston Citizen's Association] supports the air rights development of a deck over the Dulles highway that would accommodate parking, provide access for pedestrians, bicycles, and feeder buses from all directions, and supports mixed-use development immediately adjacent to the station entrances above the highway in order for the community to be integrated across the highway and integrated with the station. (0040 0041-7)

> ***Response:*** *With respect to air rights development above Metrorail stations in freeway medians, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and/or operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Need for Transit Oriented Development Patterns

Public Comment: The existing condition is that the current Virginia Transit System has multiple transit stations in place that continue to fail as actual transit-oriented development. Those stations are instead commuter depositories that perpetuate the myth that we can live 50 miles from our job and expect a speedy, uncomplicated trip to work and back home daily. The priority capital investment of both public and private sectors should be in those nonfunctioning TODs. (0115 0135-2)

Public Comment: The more immediate need is to invest in transforming the nonfunctioning rail stations into viable transit-oriented developments and to secure the Tysons, Springfield, and Wilson Bridge TOD additions. (0115 0135-4)

> ***Response:*** *Comment Noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA and preparation of the Final EIS.*

6.0 TRANSPORTATION EFFECTS

6.1 Transit Effects

A. Draft EIS Comments

State Agency Comments

Consider Additional Development Approved by the County

State Comment: My reading of the Travel Demand Forecasting Technical Report provides no insight as to the levels of development assumed along the corridor. Since the Economic and Secondary Development Effects of the additional development are quantified elsewhere in the DEIS and in the supporting technical report, the additional development levels that the County has approved for each of the station sites also need to be considered in the ridership projections. (0387, 0387-L –7)

> ***Response****: The Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses were included in Chapter 9 of the Draft EIS and the Travel Demand Forecasting Methodology and Results Technical Report (June 2002). Chapter 5 of the Final EIS does discuss the potential effects of increasing densities on the level of development as a result of the two Build Alternatives. In addition, density bonuses were included in the analysis of secondary development effects that is presented in Chapter 9 of the Final EIS. This analysis was included in the Final EIS in order to address comments about the need to quantify the potential effects of increased density on traffic at Metrorail station areas.*

Interim Express Bus Service and Future Rail Service

State Comment: Local governments are to be complimented for the express bus system it has put in place. It is a form of bus rapid transit. It should be increased and enhanced. But future plans should be directed to the rail alternative, using express bus in the interim. (0131, 0163-T –8)

> ***Response:*** *The comment reflects the final recommendations of the Project Team and the evaluation of the two Build Alternatives in the Final EIS.*

Clarifications Regarding BRT Stops, Traffic Forecasting Assumptions, HOV Assumptions, Interchanges Included in CLRP, Roadways in TIP/CLRP, Forecast Roadway Volumes, Development Impacts and Mitigation, Impact Analysis Techniques, and Pedestrian Safety

State Comment: Traffic Analysis and Station Access Study - Technical Report (June 2002)
[a]* Pg. 13, item 2.2, BRT Alternative: 2nd paragraph states: "BRT stops would be located at facilities outside the median [of the DAAR]", and "BRT vehicles would provide access to stops by leaving the DAAR or the Greenway". Examples or descriptions of the BRT stops would be very helpful for the reader to better understand the difference between BRT stations and BRT stops.
[b]* Section 3.3, Pg. 22, 2nd full paragraph - The report states that volumes for the various ramps proposed by VDOT to access Route 7 and 123 expressways from the local roads were necessary to complete the balancing process, and that these were obtained from the Tysons Corner Route 7 and Route 123 Transportation Collocation Study (Collocation Study), State Project Number TPD 11671-2-01, dated April 3. It should be noted that the Draft Collocation Study report was conducted within a compressed 3-month schedule. As stated in Chapter VI of the Collocation Study, traffic growth was based on a previous report (June 2002 Route 7/123 Corridor Study) and on several assumptions. It is hoped that any traffic volumes used in the DCRTP study included an understanding of the Collocation Study's context and limitations, and a verification of the assumptions used. We recommend that both the

Traffic Analysis and Station Access Study and the Travel Demand Forecasting Methodology reports include a description of: the assumptions and how they were verified or modified as appropriate; and how the resulting volumes were determined to be consistent with the overall forecasting effort conducted specifically for the DEIS.

[c]* Section 6.3, pg. 134, Table 6-2 - Footnote 1 states that "Direction not specified by VDOT" yet numbers refer to Dulles Toll Road eastbound. Note 2 refers to Route 50, yet Footnote 2 refers to HOV lane on I-495. It appears that the text of the footnotes was changed between the 95% Review Draft and this latest (June 02) report, but the corresponding notes on the table were not revised. Footnote 1 in the 95% Review Draft referred to "Volumes exclude high occupancy vehicle lanes; no direct comparison to year 2000 can be made" (please note that by year 2000 (base year in table), HOV lanes were already in place and, for the DTR, volumes are available by lane.

[d]* Chapters 9 through 17:The proposed interchanges at 7/West Park-Gosnell and 123/International are not identified in the CLRP. Although an interchange at an isolated location does not need to be called-out from an air quality conformity standpoint, a series of interchanges in close proximity to one another could change the functional classification (for modeling) of the road from arterial to freeway (which would have to be accounted for in the model).

[e]* Monroe St/Van Buren in the town of Herndon are not identified for improvement in the adopted FY-01
TIP/CLRP. East Elden St. is identified in the adopted FY-01 TIP/CLRP as reconstructed as a 4-lane section between Monroe St. and the Herndon Parkway East and widened to 6 lanes between the Herndon Parkway East and the Fairfax Co. Parkway. Both widening and reconstruction have a completion date of 2005.

[f]* It is suggested that, when discussing the Planned Roadway Improvements, the CDRTP DEIS report make specific reference to their source official documents: the Six Year Program, the Transportation Improvement Program (TIP) and the Constrained Long Range Plan (CLRP), and the Fairfax County Comprehensive Plan. Please refrain from using statements about "VDOT's decisions" that are not backed up by the approved Six Year Program. For projects beyond the Six Year Program time horizon, reference should be made to the source document (TIP, CLRP as appropriate), noting that these documents are the result of cooperative efforts of multiple agencies at various levels (federal, state, local) and subject to public review. Please remove all references to VDOT deciding that specific interchange and road widening projects (Route 7 and Route 123) are "high priority" (e.g. section 10.1 on pg. 173, section 11.1 on pg. 187, section 12.1 on pg. 203, section 14.1 on page 233). Prioritization is typically a result of coordinated evaluation with input from Fairfax County, and in accordance with Fairfax County's Comprehensive Plan. Perhaps the consultant is making inferences from preliminary or final VDOT-funded consultant reports such as the 6/00 Transportation Corridor Study by PHR&A, or the 2/5/02 Tysons Corner Selected Improvement Compatibility Study by PTG. It should be noted that although these reports are used by VDOT as tools for analysis/coordination, their recommendations do not necessarily imply VDOT's concurrence.

[g]* Existing traffic volumes appear low. For example the intersection of Route 123 at Tysons Boulevard indicates 90 vehicles during the a.m. peak and 62 vehicles during p.m. peak making left turns from southbound Tysons Boulevard onto eastbound Route 123. A recent traffic study done in the same area indicates that the existing a.m. left turn (same as above) as 392 vehicles and 1845 vehicle during the p.m. peak. All numbers need to be checked properly and appropriate numbers used as a starting base.

[h]* The County has the nondegradation policy in place it is unclear as to how the increased development is planned to be mitigated. Also how is all the planned future higher densities addressed in the study? Are they included in the overall growth rate?

[I]* Pg 19 - Highway impacts are not analyzed in detail, only very generic information is presented in the document. No supporting data/analysis were provided. Statement is made that there are Synchro, HCM, Signal2000 and Transyt-7F files available for review but they were not included in the package. All the files in a electronic format as well as paper copies need to be provided for the Department's thorough review. The report includes summary findings that are very generic in nature. Highway corridor impacts need to be addressed.

[j]* Accident data and analysis are very generic and does not include the details needed. Specific attention needs to be given to address the pedestrian safety concerns. (0421, 0421-A –1)

Response: *A point-by-point response to these comments is provided below.*
[a]* *Site plans for the proposed BRT stations and BRT stops were provided in the proposed General Plans (Draft EIS Volume IV, June 2002).*

[b] The Since there will be no park-and-ride facilities (other than 500 spaces at Tysons West Station) and only two Kiss & Ride facilities at the four Tysons Corner Metrorail stations and since there will be minor changes to the roadway network in Tysons Corner, the analysis in support of the Draft EIS was not reanalyzed based on the fact that project-related impacts would be minimal.*

[c]* *Comment Noted. However, the Traffic Analysis and Station Access Technical Report (June 2002)* has *not been reproduced for this subject matter. The footnote would have been clarified to reflect the absence of HOV lanes only on the Beltway in 2000. Effects of the project on the non-HOV portion of the DTR were provided in the table.*

[d] Comment noted. References to the CLRP had been deleted from these chapters of the Draft Technical Report. In the case of Tysons Corner, the Project Team had desired that the network be as consistent as possible with highway improvements included in VDOT's Collocation Study. The basis for the Team's network assumptions were clarified in Chapter 3. If the operational characteristics of a roadway change, as on Route 7, the highway class and speed code in the model were changed accordingly; thus the model did account for this. For the analysis in support of the Final EIS, the proposed interchanges of Route 7 and Route 123 in Tysons Corner as identified by the Fairfax County in its Comprehensive Plan are not part of the future roadway network, since the interchanges are not yet recognized by regional plans.*

[e] The roadway network was modified for the Final EIS to reflect the most recent TIP/CLRP.*

[f] Comment Noted. However, the Traffic Analysis and Station Access Technical Report (June 2002) has not been reproduced in its entirety. The* Traffic Analysis Technical Report *prepared in support of the Final EIS will include the table of roadway improvements that the Project Team had prepared as input to the travel demand forecast model.*

[g] Since there will be no park-and-ride facilities (other than 500 spaces at Tysons West Station) and only two Kiss & Ride facilities at the four Tysons Corner Metrorail station, and since there will be minor changes to the roadway network in Tysons Corner, the analysis in support of the Draft EIS was not reanalyzed based on the fact that project-related impacts would be minimal.*

[h] Chapter 22 of the Traffic Analysis and Station Access Technical Report (June 2002) discussed the secondary development-related travel effects and related mitigation strategies. The analysis included in this chapter provided a "worst-case" look at the density bonuses approved by Fairfax County. All traffic impacts that would result from the increased densities would be mitigated by Fairfax County.*

[I] Regional highway operations were addressed in Chapter 6 of the Technical Report. The analysis presented the long-term (2025) and opening year effects that the Build Alternatives would have on selected highway links within the corridor. All peak hour data was received from Laura White at VDOT in Richmond. All resulting model output was provided in the Appendix to the report. Traffic analysis output was provided to VDOT.*

[j] Accident analyses were provided for each station area in Chapter 8 through 21 of the Technical Report. The methodology used for this analysis was provided in Section 3.8 of the same report. Due to time constraints, accident models were not developed for this analysis; rather the analysis is based on accident experience trends and professional engineering judgment based on planned roadway improvements on a particular segment. In terms of pedestrian safety, every effort will be made to minimize pedestrian and motorist conflicts through the design of the stations. As part of the project, pedestrian and vehicular access would be provided to each station from the nearest public rights-of-way. All other planned pedestrian and bicycle trails fall under the jurisdiction of the City of Falls Church, Town of Herndon, Fairfax and Loudoun counties and VDOT.*

Clarifications Regarding Transit Operations Information

State Comment: Pg. 6.53: Table 6.3-11 - suggest adding "Corridor Transit" to beginning of title. (0421, 0421-A –20)

State Comment: Transit Operations and Maintenance Plan - Technical Report (June 2002)

- § Page 28 - Shows the summary of dead head calculations. The Metro rail Service and inspection yard sites are listed in column 1 but not show in the report. Please include a map showing these potential locations for the Metro rail Service and inspection yard sites.
- § Page 29 - Table 3-8 Some of the columns heading show units and others particularly the distance column does not show any units. Please check all the tables to include the units for columns.
- § Chapters 1 & 2 - Header on most of the pages incorrectly displays Index of Figures in the upper right hand corner on most of the pages.
- § Page 23 - 2nd paragraph second line should read New Carrollton would be replaced instead of New Carrollton would replaced. (0421, 0421-A –3)

***Response**: The* Transit Operations and Maintenance Plan *was updated as part of the Final EIS. Relevant comments were addressed in that document.*

Recommend Establishing An Executive Summary, Screenline Volumes, and LOS With and Without Improvements

State Comment: Travel Demand Forecasting Methodology and Results & Travel Demand Forecasting Methodology and Results Appendix - Technical Report (June 2002)

- § An executive summary as previously suggested, is highly recommended. This summary ought to include information such as transit modal split, LOV and HOV for both with and without Transit (i.e. Tyson or Herndon to DC). It is unclear what are some of the critical assumptions and data sources used.
- § Screen-line volumes for the forecasted years under all alternatives, including no-built should be included.
- § It is very difficult to assess whether Highway LOS for the corridor has been addressed. It would be helpful to include Highway LOS for both with and without transit improvements and increase land use density, in order to evaluate highway impact and related mitigation measures identified. "Dulles Corridor Transit Trip Summary, 2025 Alternative T4, Home Based Work Person Trips" Table (in the Appendix I, no page #, no table #) shows 64.6% transit share from Tyson to DC Core. In this case, please show the impact on the highway LOS. (0421, 0421-A –2)

***Response**: Transit mode split, intersection levels of service and highway Levels of Service are presented in Chapter 6 of the Final EIS).*

<u>Regional Agency Comments</u>

High Demand for Metrorail

Regional Comment: Independent market research has shown a high demand for a rail system that offers competitive trip times with the automobile and a convenient service-oriented operation for the customer. (0133, 0133-T –3)

***Response:** The analysis presented in Chapter 6 of the Draft EIS and Final EIS shows that the two Build Alternatives offer similar travel times for many of the analyzed origin-destination pairs. In many of these cases, travel times are competitive with those for automobile travel.*

Need Source for Air Passenger Projections

Regional Comment: The source of the IAD passenger projections for air travel presented in DEIS Section 1.2.2.4 needs to be identified. The figures do not agree with MWAA's unconstrained projections

of passenger activity, which have been reviewed and approved by FAA. MWAA projects 37.9 million annual passengers (MAP) for 2010 and a build-out scenario of 65.7 MAP. Note that the term "million annual passengers" includes the sum of enplanements and deplanements, not simply "boardings" as stated in the DEIS. (0440, 0440-A –4)

> ***Response**: Comment noted. MWAA's airport passenger projections have been updated in the Final EIS.*

Public Comments

Concerns About Capacity Constraints of the Metro System

Public Comment: Core capacity of the metro system overall is a serious concern. We are all well aware of Metro's equipment supply and maintenance issues now, and the many trains and stations that currently experience overcrowding at rush hours. Rosslyn has been described in a Post article as a choke point, and Metro Center has difficulty handling the number of commuters it now serves. This calls into question whether the overall system will be available to accommodate the increases in ridership overall as our region continues to experience significant growth. I think it is unrealistic to think of these as connecting and have people simply going between the airport and Tysons. (0150, 0150-T –3)

Public Comment: The overall capacity of the system needs to be realistically evaluated. (0150, 0150-T –11)

Public Comment: Another concern is the looming problem of Metro's core capacity constraints, and the fact that the Orange Line is near or at capacity (in one direction). It is essential that you be forthright about the impact of this project, if it were successful, on the problems of core capacity. The DEIS makes note of the Core Capacity study, but there is no information about the timing or effects that the improvements will have on the Dulles project. If the core capacity changes are not made, in what ways will it impact this project? (0158, 0223-M –5)

Public Comment: Another concern is the looming problem of Metro's core capacity constraints, and the fact that the Orange Line is near or at capacity in one direction. It is essential that you be forthright about the impact of this project, if it were successful, on the problems of core capacity. The DEIS makes note of the core capacity studies, but there is no information about the timing or effects that the improvements will have on the Dulles project. If the core capacity changes are not made, in what ways will it impact this project? (0158, 0158-T –6), (0158, 0475-L –5)

Public Comment: Rail is the Locally Preferred Alternative. I believe everybody who wants to see transportation improvements in the Dulles Corridor supports rail. But I have some questions. How will the Orange Line metro, now approaching capacity, handle increased ridership? (0181, 0181-T –3)

Public Comment: One thing that is of concern to ACT is the core capacity of the existing Metro System in the District of Columbia. The existing tunnel under the Potomac River is already at capacity. How will the additional trains that service to Dulles will need get to and through the District? (0428, 0428-E –2)

> ***Response:** To meet market demand, WMATA has a Capital Improvement Plan (November 2002) for Metrorail system capacity and service reliability. The CIP will increase train consists from six to eight cars, reconfigure the Blue and other Lines, and change the headways of all Lines, other than the Red Line, from six to seven minutes. As a result, the number of cars through the Rosslyn portal will be increasing. In 2004, the number of inbound Orange Line cars through the Rosslyn portal during the peak hour is 114. In 2011, with the opening of the Wiehle Avenue Extension, the number of cars, including those of the new Extension, will increase to 140 cars in order to satisfy higher ridership due to growth and to the Extension. The 26 additional cars will be procured by the WMATA Metro Matters program and by the Project.*

As described in Section 6.1 of the Final EIS, WMATA measures train loading by passengers per car (PPC) and by the number of passengers 'passed-by' on the platform, i.e., passengers unable to board a crowded train. WMATA has an objective of 120 PPC during the peak hour. WMATA operation planners estimate that the Orange Line PPC is currently 100 PPC, at the point where the trains have maximum loading - between Courthouse and Rosslyn. Table 6.1-12 of the Final EIS indicates that this loading will increase to 107 to 124 PPC in 2011 with the opening of the Wiehle Avenue Extension.(The maximum load point moves between Rosslyn and Foggy Bottom). Thus, the above addition of 26 cars will not match the higher ridership, but the train loading will be near the WMATA objective of 120 PPC. Beyond 2011, WMATA will continue to procure new cars to meet the market demand; thus, more and more trains will be eight-car consists.

BRT Could Provide Greater Capacity

Public Comment: BRT could provide greater transit capacity than Metrorail in the Dulles Corridor. There are BRT systems operating today that carry three to four times as many passengers per hour as the proposed Metrorail extension. Metrorail, however, already has significant capacity issues on the Orange Line, particularly where the Orange and Blue Lines converge in Rosslyn. (0444, 0444-E –3)

***Response**: As outlined in Chapter 2 of the Draft EIS, the operating plan for BRT would have resulted in approximately 80 BRT vehicles serving the eastern end of the corridor in the peak hour in the peak direction. With approximately 61 seats per vehicle (standees should not be allowed on high-speed bus service on busways and HOV lanes), the peak-hour capacity provided by the BRT Alternative would have been 4,880 passengers. The Metrorail operating plan will result in 9 trains traversing the corridor in the peak hour in the peak direction. With 8 cars per train and a loading goal of 120 passengers per car per hour, the Metrorail Extension will provide capacity for 8,640 passengers during the peak hour. Therefore, Metrorail capacity in the Dulles Corridor would be nearly twice that of BRT.*

Space considerations at West Falls Church would have limited the ability to increase the number of BRT bus bays at this station to support more than the 80 vehicles per hour in the peak period, as proposed in the Draft EIS. Moreover, at this flow rate, vehicles would have arrived at West Falls Church every 45 seconds, on average. More frequent arrivals would likely have resulted in delays, as buses would have been forced to wait for an open bay until buses in front of them pulled out.

For different applications in other cities, where the same limitations on standees and the volume of buses do not apply, BRT systems can have much higher capacities. In some cases, BRT systems carry the same level of demand as rail systems. As part of analysis for the range of alternatives proposed on the Dulles Plan B website during the Draft EIS, the Project Team evaluated the potential for higher-capacity BRT vehicles to meet the demand projected for Metrorail. The detailed response for Dulles Plan B, confirmed that, even with higher-capacity, BRT vehicles cannot meet the demand that Metrorail satisfies

As described in the analysis, transportation systems must be designed to support the demand expected during the "peak of the peak," even though this may result in under-utilization of capacity for the rest of the peak period. For the two Build Alternatives of the Final EIS, this "peak of the peak" demand requires that the system have enough capacity to support approximately 7,500 passengers in the peak direction, in the peak hour for operations in the corridor.

The analysis in the detailed response demonstrated that if vehicle size would have been increased to 80-foot bi-articulated buses with approximately 80 seats (the largest BRT vehicles currently available), the maximum capacity that could have been provided by the BRT Alternative as then defined would have been 6,400 persons in the peak hour and peak direction (80 buses per hour serve the corridor during the peak period). This capacity is not enough to meet the peak demand for Metrorail.

To meet market demand, WMATA has a Capital Improvement Plan (November 2002) *for Metrorail system capacity and service reliability. The CIP will increase train consists from six to eight cars, reconfigure the Blue and other Lines, and change the headways of all Lines, other than the Red Line, from six to seven minutes. As a result, the number of cars through the Rosslyn portal will be increasing. In 2004, the number of inbound Orange Line cars through the Rosslyn portal during the peak hour is 114. In 2011, with the opening of the Wiehle Avenue Extension, the number of cars, including those of the new Extension, will increase to 140 cars in order to satisfy higher ridership due to growth and to the Extension. The 26 additional cars will be procured by the WMATA Metro Matters program and by the Extension project. The next paragraph relates the number of cars to train loading.*

As described in Section 6.1 of the Final EIS, WMATA measures train loading by passengers per car (PPC) and by the number of passengers 'passed-by' on the platform, i.e., passengers unable to board a crowded train. WMATA has an objective of 120 PPC during the peak hour. WMATA operation planners estimate that the Orange Line PPC is currently 100 PPC, at the point where the trains have maximum loading - between Courthouse and Rosslyn. Table 6.1-12 of the Final EIS indicates that this loading will increase to 107 to 124 PPC in 2011 with the opening of the Wiehle Avenue Extension. (The maximum load point moves between Rosslyn and Foggy Bottom). Thus, the above addition of 26 cars will not match the higher ridership, but the train loading will be near the WMATA objective of 120 PPC. Beyond 2011, WMATA will continue to procure new cars to meet the market demand; thus, more and more trains will be eight-car consists.

Concerns About Capacity of Orange Line

Public Comment: In addition, the EIS ignores the significant capacity issues already facing the Orange Line. Just last year, WMATA was considering a $6 billion program to separate the Blue and Orange lines, effectively doubling the capacity of the Orange Line, a project made necessary by significant overcrowding on the Orange Line. The EIS does not address how the capacity issues will be solved if the Orange and Blue lines are not separated. In fact, the EIS states that 30 trains per hour will travel though the Rosslyn/Foggy Bottom tunnel during peak hours, which exceeds the 26 trains per hour considered necessary to maintain acceptable service levels. By contrast, a BRT alternative could be designed that would help avoid overstressing the Orange line. In the EIS, all three BRT alternatives take passengers to the West Falls Church Metro Station, where they must transfer to the Orange line. No consideration is given to taking passengers to other stations, such as Rosslyn, where they could transfer to Metrorail without crowding the Orange line, and without stopping at all of the stations between East Falls Church and DC. (0445, 0445-E –10)

***Response**: Metrorail in the Dulles Corridor will actually relieve overcrowding on the outer Orange Line, because Metrorail customers in the Dulles Corridor would access Metrorail at a Dulles Corridor Metrorail station rather than boarding at an outer Orange Line station. BRT ridership estimates, however, showed that many riders from the Dulles Corridor would have gone to an outer Orange Line station to access transit, rather than board BRT in the corridor. The reasons that BRT was not extended eastward beyond West Falls Church in the Draft EIS include the lack of bus terminal capacity at stations east of West Falls Church as well to avoid congestion on I-66, which would degrade BRT performance.*

To meet market demand, WMATA has a Capital Improvement Plan (November 2002) for Metrorail system capacity and service reliability. The CIP will increase train consists from six to eight cars, reconfigure the Blue and other Lines, and change the headways of all Lines, other than the Red Line, from six to seven minutes. As a result, the number of cars through the Rosslyn portal will be increasing. In 2004, the number of inbound Orange Line cars through the Rosslyn portal during the peak hour is 114. In 2011, with the opening of the Wiehle Avenue Extension, the number of cars, including those of the new Extension, will increase to 140 cars in order to satisfy higher ridership due to growth and to the Extension. The 26 additional cars will be procured by

the WMATA Metro Matters program and by the Extension project. The next paragraph relates the number of cars to train loading.

As described in Section 6.1 of the Final EIS, WMATA measures train loading by passengers per car (PPC) and by the number of passengers 'passed-by' on the platform, i.e., passengers unable to board a crowded train. WMATA has an objective of 120 PPC during the peak hour. WMATA operation planners estimate that the Orange Line PPC is currently 100 PPC, at the point where the trains have maximum loading - between Courthouse and Rosslyn. Table 6.1-12 of the Final EIS indicates that this loading will increase to 107 to 124 PPC in 2011 with the opening of the Wiehle Avenue Extension. (The maximum load point moves between Rosslyn and Foggy Bottom). Thus, the above addition of 26 cars will not match the higher ridership, but the train loading will be near the WMATA objective of 120 PPC. Beyond 2011, WMATA will continue to procure new cars to meet the market demand; thus, more and more trains will be eight-car consists.

Need to Clarify Operational Assumptions

Public Comment: The DEIS makes no mention of an "average speed," which factors in stopping times at stations. In Maryland's Corridor Cities Transitway study - also a contest between bus and rail in the I-270 area - and Purple Line major investment study, average speeds are given (for example, 22 mph for light rail and bus in the case of Corridor Cities). But in the case of the Dulles study, it would appear WMATA and VDRPT used an "assumed permitted speed" of 59 mph for rail and 55 mph for bus. They also factored in a 30-second "dwell time" to stop at stations and offload and load passengers. Federal data shows that the average speed of Metro is 25 mph. Dwell times at stations are more like one minute. It is physically impossible for even a four-car Metro train to get up to 59 mph between stations, except perhaps on a long stretch. In contrast, a bus can exceed 55 mph and obtain that speed within 1 to 2 minutes. Speed is essential in determining travel times from point-to-point and travel time is a key factor in determining whether people will use transit. WMATA's table showing a 78-minute trip from Dulles Airport to Union Station is unreal and probably based on these "permitted speeds" and underestimated dwell times. Such a trip is about 45 miles. It would require stopping at more than 20 stations plus a transfer at Metro Center to a Red line train. In contrast, a trip from White Flint to Metro Center (about 20 miles and 10 stops) takes 45 minutes to an hour. Hence, a trip from Dulles Airport to Union Station is more likely to take over 90 minutes by rail, but half that time on BRT. (0112, 0462-L –5)

***Response**: Total travel time is the relevant input into the travel demand forecasting model. This data for Metrorail is included in the Transit Operations and Maintenance Plan Technical Report. Since total distance is also available in the tables of the Report, average speed can be easily calculated. The maximum attainable speeds were used as part of the simulation package to determine travel time, but the simulation package also considers the number of stations, distance between stations, the number and radius of curves, station dwell time, and vehicle acceleration rates.*

Based on the data, the average speed of Metrorail in the corridor is approximately 36 miles per hour. The average system wide speed of 25.2 miles per hour reflects the extremely varied nature of the Metrorail system, including suburban stations that are more than a mile apart and downtown stations that are one-quarter mile apart.

Average Speed Assumed for Analysis

Public Comment: A significant factor in determining transit ridership - whether it is BRT, light rail or heavy rail - is average speed. Section 3.1.4, Table 3-5 on page 21 of your technical report, "Transit Operations and Maintenance Plan," mentions "maximum free flow speeds (miles per hour)" for the Dulles extension and BRT. It also notes these are "assumed" speeds. It appears you used these speeds in your modeling, not average speeds, because I saw no "average speeds" any where in the documents. (See Exhibit 2) However, nowhere do you see "average speed" when you calculate boarding times at stations (dwell time). Table 3-5 only provides the maximum design speed (75) and permitted attainable speed

(59.5 mph), and no maximum design speed for buses, but you have a permitted attainable speed of 55. (0112, 0462-L –24)

Public Comment: The DEIS makes no mention of an "average speed," which factors in stopping times at stations. In Maryland's Corridor Cities Transitway study - also a contest between bus and rail in the I-270 area - and Purple Line major investment study, average speeds are given (for example, 22 mph for light rail and bus in the case of Corridor Cities). But in the case of the Dulles study, it would appear WMATA and VDRPT used an "assumed permitted speed" of 59 mph for rail and 55 mph for bus. They also factored in a 30-second "dwell time" to stop at stations and offload and load passengers. Federal data shows that the average speed of Metro is 25 mph. Dwell times at stations are more like one minute. It is physically impossible for even a four-car Metro train to get up to 59 mph between stations, except perhaps on a long stretch. In contrast, a bus can exceed 55 mph and obtain that speed within 1 to 2 minutes. Speed is essential in determining travel times from point-to-point and travel time is a key factor in determining whether people will use transit. WMATA's table showing a 78-minute trip from Dulles Airport to Union Station is unreal and probably based on these "permitted speeds" and underestimated dwell times. Such a trip is about 45 miles. It would require stopping at more than 20 stations plus a transfer at Metro Center to a Red line train. In contrast, a trip from White Flint to Metro Center (about 20 miles and 10 stops) takes 45 minutes to an hour. Hence, a trip from Dulles Airport to Union Station is more likely to take over 90 minutes by rail, but half that time on BRT. (0112, 0462-L –5)

Public Comment: What are the average speeds assumed for rail and bus? In the EIS I believe there is a "top speed" from station to station, 59 mph for bus and rail, or something like that, but what is the average speed for the Dulles Rail and Dulles BRT considering station stops? (0112, 0382-L –3)

Public Comment: Secondly, these speeds are not even in line with the inflated AVERAGE speeds Maryland DOT used for its Purple Line study - 47 mph for heavy rail and about 35 mph for light rail. According to the "Urban Transport Fact Book," prepared from 1997 data from the Federal Transit Administration, Washington's Metrorail system only averages 25.2 miles per hour! (0112, 0462-L –26)

Public Comment: Buses can average 50 miles per hour even with the six stops slated in these proposals. Metrorail would travel no more than 35 mph given the numerous stops in between, and the idea of having as many as six stops just at Tysons Corner is ridiculous. Also, if you wanted to, you could just add express bus service to the Dulles Access Road, build flyover ramps at key locations for on-and-off traffic, and charge single occupancy motorists to use it under the HOT lane/congestion pricing concept. (0112, 0269-M –7)

Public Comment: Bus rapid transit is not only a faster mode, but it's cheaper. This means motorists who want to drive alone could pay -- we could have hot lanes with this to help pay for the cost of that. There's no hot lane proposal here that I can see. Buses can average 50 miles per hour, even with six stops in between. Metro, I would say, would be no more than 30 or 35; at least that's what the Purple Line study showed. (0112, 0245-T –7)

> ***Response****: Total travel time is the relevant input into the travel demand forecasting model. ridership for a given transit alternative will be more dependent on travel times than on average speeds. The Transit Operations and Maintenance Plan (June 2002) prepared in support of the Draft EIS showed that Alignment T6 had a travel time of approximately 41 minutes between the Route 772 and East Falls Church stations. The all-stops operating pattern for BRT 1 had a travel time of approximately 48 minutes between Route 772 and West Falls Church, even though this alignment has fewer stops than Alignment T6.*
>
> *Since total distance is also available in this technical report, average speed can be easily calculated. The maximum attainable speeds were used as part of the simulation package to determine travel time, but the simulation package also considers the number of stations, distance between stations, the number and radius of curves, station dwell time, and vehicle acceleration rates. Based on this data, the average speed of Metrorail in the corridor is approximately 36 miles per hour (mph). The average speed of BRT 1 (Route 772 to West Falls Church making all*

stops) would have been 31 mph. The average Metrorail system wide speed of 25.2 miles an hour reflects the extremely varied nature of the Metrorail system, including suburban stations that are more than a mile apart and downtown stations that are one quarter mile apart.

As the owner and operator of the Dulles Toll Road (and other major HOV facilities in the region), it would be VDOT's responsibility to fully evaluate and implement any proposals that allow travelers driving alone to use the HOV lanes during peak hours for a fee ("value pricing"). Such value pricing systems would require would require in-depth study. Issues include the lack of space for barrier-separation, technological challenges associated with a non-barrier-separated system, and equity considerations.

Accessibility and Frequency of Metrorail Service in Corridor

Public Comment: We need to be sure that the rail options through Tysons will be extensive, easy to access, and run frequently at all hours, to encourage people to leave their cars off the roads. (0179, 0179-T –7)

Response: *Access provisions for four Metrorail stations in Tysons Corner include pedestrian bridges across major roadways, and Kiss-and-ride facilities at the Tysons West Station and Tysons East Stations. All stations include provisions for feeder bus service or are located near existing bus stops.*

The Wiehle Avenue Extension would have the same operating hours as the existing Metrorail system: 5:00 a.m. to 12 p.m. on weekdays (2 a.m. on Friday), 8 a.m. to 3 a.m. on Saturdays, and 8 a.m. to midnight on Sundays.

Service Must be Rapid and Affordable

Public Comment: This new service must not only be affordable for the riders and the taxpaying public, but it also must be rapid, or it may not be used by those of us for whom it is to be built. (0148, 0148-T –2)

Response: *The analysis presented in Chapter 6 of the Final EIS shows travel times for a number of origin-destination pairs. In many of these cases, travel times are competitive with those for automobile travel.*

Concerns Regarding Speeds and Travel Times Assumed for Analysis

Public Comment: Speed is a significant assumption in modeling any new transportation project and if you assumed these speeds for rail, your ridership projections are highly suspect, but so are your travel times. For example, Table 6.3-4 on Page 6-40 of Part I of the EIS is impressive for what is left out - an estimated rail travel time from Dulles Airport or any of the Loudoun County stations to any rail station in the District of Columbia. Might this omission be due to the unpleasant truth that such trips will take over 90 minutes in each direction if done by rail? (See Exhibit 3) However, this table forecasts a 57-minute estimated Metrorail ride time from Union Station to Reston Town Center and 60-minute ride via express bus. How can a train stop at seven stations between Reston and East Falls Church, and from there, 10 more station stops on the Orange Line, plus a transfer to a Red Line train at Metro Center, and make the trip in 57 minutes, when it took me 45 minutes to one hour to ride the Red Line from White Flint to Metro Station, which only requires stopping at 10 stations? Why weren't travel times between ALL stations computed and provided to the public? It is physically impossible for a Metro train to do this unless you are assuming 59 mph speeds, which means you will likely have many passengers with upset stomachs due to the revving up of high speeds and slowing down from station to station. But your calculation of 30-second "dwell times" also is mischievous. It is preposterous to assume that a Metro train can stop and unload and load passengers in only 30 seconds. More likely, we are talking about a 1 to 2 minute dwell time. (0112, 0462-L –25)

Public Comment: How can a trip from Dulles Airport to Union Station take only 78 minutes (see one of your charts) and pass more than 25 stations in the process, when now it takes me about 45 minutes to an hour to go from White Flint to Union Station, and that is no more than passing 15 stations? (0112, 0382-L –5)

> ***Response****: The travel times for both Metrorail and BRT were developed using a detailed simulation package that takes into account station dwell times, number and radius of curves, allowable train speeds, vehicle acceleration times, number of stations, and distance between stations. The inputs into the model such as station dwell time reflected WMATA experience from existing operations and WMATA vehicle characteristics. Travel times outside the corridor reflected WMATA schedules that are used in the operation of the system. Scheduled trip time between White Flint and Union Station is 30 minutes. Travel times between all stations in the corridor are shown in the Transit Operations and Maintenance Plan (June 2002). This document was a public document. The 30-second dwell time is the WMATA standard and is based on current operating experience.*

Dwell Time at Stations

Public Comment: Why are you assuming only a 30 second layover at rail stations? Isn't it more like a 1 minute layover, especially during rush hour? (0112, 0382-L –4)

> ***Response****: The 30 second dwell time is the WMATA standard and is based on current operating experience.*

Public Comment: Coordinate mitigation for traffic impacts with the WMATA West Falls Church parking garage project. (0388 6-1)

> ***Response:*** *For the Final EIS, the Project Team included the new 960-space WMATA park-and-ride structure in the No-Build Alternative for the traffic analysis of this station area.*

Consider Additional Development Approved by the County in Ridership Projections

Public Comment: Since the Economic and Secondary Development Effects of the additional development are quantified elsewhere in the DEIS and in the supporting technical report, the additional development levels that the County has approved for each of the station sites also need to be considered in the ridership projections. (0387, 0387-L –7)

Public Comment: Part of the analysis that was done --it was done by Loudoun County's changes to the comprehensive plan, but it was done for Reston stations and it's buried in one of the technical appendices, but is showed in Reston where we did also revise our comprehensive plan last year to promote transit oriented development with a mix of shops and housing at the stations, that you can substantially increase the number of riders, and it would go from 87,000 to 101,000, and the number of new riders would increase from 38,000 to 54,00. (0141, 0243-T –5)

> ***Response****: The travel demand forecasts in the Final EIS are based on the Metropolitan Washington Council of Governments' Round 6.3 Cooperative Land Use Forecasts. The Round 6.3 forecasts represent the regionally adopted population and employment forecasts through 2025, for the metropolitan Washington area, including Fairfax and Loudoun County. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS. The changes in the Fairfax and Loudoun County Comprehensive plans must be incorporated into the regionally adopted land use forecasts in order to be reflected in the model results and the Final EIS. The Project Team did incorporate density bonuses in the Tysons Corner and Reston/Herndon areas into the analysis of secondary traffic impacts in support of the Draft EIS, but these demand figures were not included in the Final EIS.*

Metrorail Travel Times

Public Comment: Contrary to popular belief, heavy rail is not very fast. With up to 13 stations from Route 772 to West Falls Church, meaning about a two-minute layover for passenger discharge and boardings, this means the entire 24-mile trip from Ashburn to Tysons would consume 26 minutes just sitting at stations. I estimate the entire trip will take about an hour - the same time it takes to ride from White Flint to Metro Center on the Red Line. This means a trip to downtown Washington from Loudoun County would take more than 90 minutes. (0112, 0269-M –5) (0112, 0245-T –5)

> ***Response:*** *Estimated Metrorail travel time from Route 772 to East Falls Church is approximately 40 minutes for the Full LPA. Estimated Metrorail travel time from Route 772 to Metro Center is approximately 60 minutes. These travel times were developed with a simulation package that takes into account station dwell times, number and radius of curves, allowable train speeds, vehicle acceleration times, number of stations, and distance between stations.*

Off-Peak Service Levels and Service Hours

Public Comment: Metrorail trains must run with the most frequent headway possible throughout the day. There is no reason to reduce the frequency of service outside of so-called "rush hours." Working and commuting patterns are constantly changing; indeed, it should be the frequency of rail service that influences people's schedules, rather than the other way around. It should be a goal to ensure that no passenger ever waits more than 5 minutes for the next train. (0290, 0290-L –2)

Public Comment: Because of the additional distance involved in travel to and from downtown DC, it is important that trains run later into the evening than they currently do along the Orange line. The significant ridership seen now on Fridays and Saturdays, when Metrorail runs to 2:00 a.m., will certainly increase with Dulles Corridor passengers. The schedule must be extended, ideally past 2:00 seven nights a week, to allow as many riders as possible to use Metro. (0290, 0290-L –3)

> ***Response:*** *Changes to WMATA policies regarding mid-day service frequencies, hours of service, and holding of trains to meet late night arrivals of planes at Dulles Airport are outside the scope of this Project, and would be the responsibility of the WMATA Board of Directors. The Metrorail operating plan in support of the Final EIS has headways of seven minutes for the sake of service reliability.*

Public Comment: There must be a provision to hold the last train of the night until after the last plane arrives at Dulles. Occasionally, planes are delayed beyond their scheduled arrival time; in that case, Metro must remain open. Arriving passengers may be counting on riding Metrorail to their destinations. This is an easy step to take to ensure that people who fly can have confidence in the availability of Metro to get to and from the airport. Intermodal cooperation such as this is key to gaining public support and increased ridership. In contrast, a stranded traveler will be a customer lost. Similarly, trains must begin running early enough in the morning -- seven days a week! -- to allow passengers from the farthest reaches of the system to reach Dulles Airport in time for the earliest scheduled flights. Not taking this step would exclude and alienate a significant number of potential riders. (0290, 0290-L –5)

> ***Response:*** *Formulation of policies on holding trains to meet late-night arrivals and early flights of planes at Dulles Airport is outside the scope of this Project, and would be the responsibility of the WMATA Board of Directors.*

Clarify Metrorail and BRT Deadhead Costs

Public Comment: What are the deadhead costs for the BRT system versus rail? (0112, 0382-L –17)

Public Comment: You refer to "deadhead costs." In table 3-7, you say that to place the rail maintenance yard at the end of the line, there will be about $4,500 per day in deadhead costs each day. Is that for the

entire system or just Dulles Rail and what would be the annualized costs of deadhead for each service yard alternative? What are the deadhead costs for the BRT system versus rail? (0112, 0462-L –44) (0112, 0382-L –16)

> ***Response**: In the Draft EIS, deadhead costs were calculated as part of the overall costs for BRT but were not broken out specifically because this data was not needed for any analysis purposes. Metrorail deadhead costs were broken out because this data was required to compare alternative yard sites. The data in the table represented daily deadhead costs incurred at each yard site only, and did not reflect costs associated with the entire system. The Project Team recommended and the decision-makers selected the Yard Site Y15 on Dulles Airport property.*

Consider Short Turning Service and Shuttle in Tysons Corner Area

Public Comment: Operations -- There was no consideration in the operation section of short line service terminating at the Tysons West or Tysons East Stations even though both include pocket tracks to accommodate the short line turnback movement. Tysons West could serve as a short line terminus for service between Tysons Corner and the core or some point further east. Tysons East could serve as the inbound terminus of service between Loudoun County and Tysons. Implementing this short line service would produce a savings in operating costs and may also reduce rail car requirements. The consideration of short line service appears to be supported by the ridership projections. In the OB direction, more than half of the Dulles Corridor riders disembark from the rail system at Tysons Corner. In the IB direction, approximately 1/4 of the riders who board the train OB of Tysons Corner will disembark at Tysons which suggests that not all of the Dulles service needs to continue IB toward the core. This cut back would facilitate the merge with the Orange Line at WFC and the Blue Line at Rosslyn. The operations analysis also needs to examine a Tysons shuttle between Tysons East and West Stations to provide internal service within Tysons. This service would be particularly useful during off peak periods to facilitate travel within Tysons for work, shopping, dining etc. and I believe that it could produce a measurable ridership increase, all of which would be new riders. It's very probable that this service could also be provided without the need to purchase additional rail cars. (0387, 0387-L –14)

> ***Response**: No consideration was given to short turning service in Tysons Corner because the significant majority of corridor riders are traveling beyond Tysons. Dulles Corridor trains will be replacing supplemental Orange Line service currently in operation. This supplemental service is used to relieve overcrowding on the Orange Line. A shuttle within Tysons Corner is no longer possible, since the pocket track at Tysons East Station was eliminated.*

B. Supplemental Draft EIS Comments

Federal Agency Comments

Impacts of Project Phasing

Federal Comment: Phasing of the project does appear to adversely effect early year ridership numbers and thus may have less of an air quality and traffic benefit in the short run as compared to an early full build out. (0085 0100-1)

> ***Response:** Ridership is not as high in the Wiehle Avenue Extension as it is in the Full LPA. Therefore some of the benefits resulting from higher ridership may not accrue until the Full LPA is completed. The impacts of phasing on air quality and traffic are documented in Chapters 4 and 6, respectively, of the Final EIS.*

Local Agency Comments

Impacts of Project Phasing

Local Comment: Table 6.2-3 Is it reasonable to expect that in 2025 for LPA I only, PNR trips will

decrease? It seems that once garages fill up, they remain that way. Also, with the Full LPA, bus trips appear to drop significantly. Is that reasonable to expect? (0093 0109-4)

> ***Response:*** *Peak hour park-and-ride trips at Wiehle Avenue Station might decline between the opening year 2011 and the forecast year 2025 for the Wiehle Avenue Extension, because fewer trips might arrive in the peak hour of arrival. Bus trips decrease significantly after implementation of the Full LPA because Wiehle Avenue would no longer be an end-of-line station; so, many of those bus trips would board at other stations.*

Public Comments

Accommodating Eight Car Trains

Public Comment: Again, the project team assumed eight car trains on the line to Wiehle. Metro now cannot run eight-car trains due to insufficient traction power. How is Metro going to upgrade its system to handle 8-car trains so you run 8-car trains on the Wiehle line? (0016 0122-6)

Response: *Under its Metro Matters campaign, WMATA is presently obtaining funding of its near-term capital needs to sustain the Metrorail and Metrobus systems. Within the $1.5 billion Metro Matters campaign, there is over $600 million for the eight-car train operations.*

Impacts of Project Phasing

Public Comment: In addition, the ridership and other projections used to justify Phase I assume that Phase II will be built, even though the FTA has clearly stated that Phase II is a separate project for purposes of funding. This analysis is highly misleading, because it misleads the public about the true likelihood of completing Phase II, and about the true benefits of building Phase I. (0063 0151-5)

> ***Response:*** *The ridership forecasts for the Wiehle Avenue Extension make no assumptions about the likelihood of the Full LPA being implemented. The Wiehle Avenue Extension ridership forecasts are based on the service definition described for Extension in the Final EIS, which is a combination of local bus services, Corridor express bus serving Wiehle Avenue, and Metrorail service at Wiehle Avenue Station on 7 minute headways.*

Travel Time Savings

Public Comment: Additionally, should rail become a reality with four stops as proposed in Tysons Corner, my commute to L'Enfant Plaza on the Orange Line would be made more time consuming than it already is. I am not pleased with the plan as it is presently proposed. (0035 0036-2)

> ***Response:*** *For passengers accessing transit in the peak direction from West Falls Church, Dunn Loring, and Vienna stations, there will be a marginal increase in transit travel times under the Wiehle Avenue Extension or the Full LPA relative to existing conditions. However, for the majority of origin points within the corridor, transit travel times will decrease. In addition, significant improvement in travel times will occur for passengers making trips in the reverse peak direction. This improvement is based on the much higher frequency of outbound service relative to today's service and also because there is direct service to key destinations in the corridor for reverse peak trips.*
>
> *The run time for Metrorail from Wiehle Avenue to East Falls Church Stations (the first Metrorail station served by the Dulles Corridor service) would be approximately 15 minutes (with a transfer time of 2 minutes, the total trip would be about 17 minutes). Travel time from Wiehle Avenue to West Falls Church Stations via the existing Fairfax Connector 980 service is about 15 minutes. However, people are required to transfer to Metrorail at West Falls Church, thus adding 2 minutes for a total of approximately 17 minutes.*

Public Comment: SDEIS, 6.1.3, states, the proposed LPA Phase 1 would improve the convenience of existing service, but would not provide the same degree of improvements as the full LPA. Travel time savings would not be as great for proposed LPA Phase 1, and transfer requirements would generally not improve over the No Build. According to the SDEIS, FTA has determined that the first phase now being considered for funding has independent utility even if the subsequent phase is never built. Therefore, using the information in 6.1.3.1, demonstrate your analysis in table format showing transit travel time between the trip from LPA Phase 1 for points east, including BRT and Premium Bus Service. (0109 0128-9)

> ***Response:*** *During the preparation of the Draft EIS, a number of other modes, including Bus Rapid Transit, were considered for the Dulles Corridor Rapid Transit Project. Based on the analysis contained in the Draft EIS, public hearings held in July 2002, and comments received on the Draft EIS, the Metrorail Alternative (T6/Y15) was selected as the Locally Preferred Alternative (LPA) a by the Commonwealth Transportation Board (CTB) and by the WMATA Board of Directors in late 2002. The purpose of the Supplemental Draft EIS was to provide additional information on refinements that have been made to the LPA since the publication of the Draft EIS Public Hearings Report. As such, the analysis of transit travel times in Section 6.1.3 of the Supplemental Draft EIS presents a comparison of travels times under the Full LPA and the Wiehle Avenue Extension compared to the No Build Alternative.*

Maintain Express Bus Service

Public Comment: Ensure that we maintain express bus service from Wiehle to Pentagon and Crystal City for the people who wish to go that way. (0064 0072-5)

> ***Response:*** *The bus operating plans used in the Final EIS assumed that Loudoun County express service to the core was maintained. Otherwise, all Fairfax Connector Corridor express bus routes feed into Wiehle Avenue Station.*

Rosslyn Tunnel Capacity

Public Comment: With the current Orange line tunnel in periodic failure, is it not safe to assume heavy rail line passenger increases could create a requirement for new expensive unplanned tunnel? What will be the impact on the current Orange line tunnel? What mitigation options are proposed to relieve this impact? What is the capital cost to implement these mitigation measures? What is the funding source for meeting the capital cost? (0107 0125-15)

Public Comment: Explain how the Rosslyn Tunnel, which is already operating over capacity, will be able to handle the addition of the Silver Line to the existing Orange and Blue Lines. (0063 0151-18)

Public Comment: The Orange Line already is over capacity. To prevent further crowding in the Rosslyn Tunnel, some Orange Line trains will need to be removed to make room for Silver Line trains. Please explain how projected growth in Orange Line demand will be met. (0063 0151-17)

> ***Response:*** *Assessment of an additional tunnel between Virginia and Washington D.C. is not within the scope of this project. The Metrorail operating plan in support of the Final EIS reflects the overall capacity of the Rosslyn tunnel of 26 trains in the peak direction during the peak hour.*
>
> *To meet market demand, WMATA has a Capital Improvement Plan (November 2002) for Metrorail system capacity and service reliability. The CIP will increase train consists from six to eight cars, reconfigure the Blue and other Lines, and change the headways of all Lines, other than the Red Line, from six to seven minutes. As a result, the number of cars through the Rosslyn portal will be increasing. In 2004, the number of inbound Orange Line cars through the Rosslyn portal during the peak hour is 114. In 2011, with the opening of the Wiehle Avenue Extension, the number of cars, including those of the new Extension, will increase to 140 cars in order to satisfy higher ridership due to growth and to the Extension. The 26 additional cars will be procured by*

the WMATA Metro Matters program and by the Extension project. The next paragraph relates the number of cars to train loading.

As described in Section 6.1 of the Final EIS, WMATA measures train loading by passengers per car (PPC) and by the number of passengers 'passed-by' on the platform, i.e., passengers unable to board a crowded train. WMATA has an objective of 120 PPC during the peak hour. WMATA operation planners estimate that the Orange Line PPC is currently 100 PPC, at the point where the trains have maximum loading - between Courthouse and Rosslyn. Table 6.1-12 of the Final EIS indicates that this loading will increase to 107 to 124 PPC in 2011 with the opening of the Wiehle Avenue Extension. (The maximum load point moves between Rosslyn and Foggy Bottom). Thus, the above addition of 26 cars will not match the higher ridership, but the train loading will be near the WMATA objective of 120 PPC. Beyond 2011, WMATA will continue to procure new cars to meet the market demand; thus, more and more trains will be eight-car consists.

Ridership Forecasts and Mode Split

Public Comment: We also suggest that Fairfax County re-evaluate its mode split data in all future traffic analysis associated with rezoning applications requested for increase in density at rail stops. The current Tysons Plan assumes a 20% mode split and a Level of Service F as the acceptable basis for any traffic study accompanying a land use application. Table 6.1-3 refers to a 16.1% mode split assumption so the Comprehensive Plan formula assumption must be modified to meet the realities cited in this EIS. (0113 0132-10)

Response: *Fairfax County's use of a 20 percent mode share includes trips by Metrorail, transit bus, car pooling and van pooling. The 13 percent in Table 6.1-5 of the Final EIS is the Metrorail share of trips.*

Public Comment: The project model predicts that ridership at the WFC station will decrease; this makes no sense at all. (0026 0027-10)

Response: *Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.*

Public Comment: Outside of New York City, no rail line carries as many passengers as a pair of freeway lanes. Right here in our area, we do not believe that any part of the WMATA system in the suburbs carries as many passengers as a pair of adjoining freeway lanes. Please confirm or deny. (0061 0069-13)

Response: *A pair of freeway lanes would carry 3,600 vehicles per hour under acceptable traffic operations (LOS D, wherein traffic is generally free flowing, though with some delay – 1,800 vehicles per hour per lane) and 4,800 at full capacity (LOS F, wherein traffic operations are severely degraded). The Orange Line to Vienna service is forecasted to carry approximately 11,000 passengers per hour at its maximum load point in the No-Build condition in 2025 (this is forecasted demand on the Orange Line if the Full LPA is not constructed). In general, rail transit provides much higher capacities than highways. ,*

Public Comment: how many of your 25,000 riders are new versus people who used buses or came off the Orange Line. (0016 0122-10)

Response: *Ridership estimates indicate there would be approximately 48000 new transit riders per day regionally in 2025 under the Full LPA. These are people that currently do not use transit.*

Operating Characteristics of Metrorail and Bus Service

Public Comment: While promising a "seamless" ride on the proposed "Silver Line," the project has never explained how it plans to accommodate demand on the Orange Line train if every other train is a Silver train. In this SDEIS, you are proposing to terminate the Silver Line at Stadium Armory and requiring a transfer there to New Carrollton. (0016 0122-22)

> ***Response:*** *With the Dulles Corridor Metrorail Project, the Orange Line through the core of the Metrorail system receives more service. The Orange Line supplemental service of 2004 and the No-Build Alternative (known as trippers) are one-direction during the peak hour. The Dulles Corridor trains replace the trippers and operate during all revenue hours, although turning back at Stadium-Armory.*
>
> *To meet market demand, WMATA has a Capital Improvement Plan (November 2002) for Metrorail system capacity and service reliability. The CIP will increase train consists from six to eight cars, reconfigure the Blue and other Lines, and change the headways of all Lines, other than the Red Line, from six to seven minutes. As a result, the number of cars through the Rosslyn portal will be increasing. In 2004, the number of inbound Orange Line cars through the Rosslyn portal during the peak hour is 114. In 2011, with the opening of the Wiehle Avenue Extension, the number of cars, including those of the new Extension, will increase to 140 cars in order to satisfy higher ridership due to growth and to the Extension. The 26 additional cars will be procured by the WMATA Metro Matters program and by the Extension project. The next paragraph relates the number of cars to train loading.*
>
> *As described in Section 6.1 of the Final EIS, WMATA measures train loading by passengers per car (PPC) and by the number of passengers 'passed-by' on the platform, i.e., passengers unable to board a crowded train. WMATA has an objective of 120 PPC during the peak hour. WMATA operation planners estimate that the Orange Line PPC is currently 100 PPC, at the point where the trains have maximum loading - between Courthouse and Rosslyn. Table 6.1-12 of the Final EIS indicates that this loading will increase to 107 to 124 PPC in 2011 with the opening of the Wiehle Avenue Extension. (The maximum load point moves between Rosslyn and Foggy Bottom). Thus, the above addition of 26 cars will not match the higher ridership, but the train loading will be near the WMATA objective of 120 PPC. Beyond 2011, WMATA will continue to procure new cars to meet the market demand; thus, more and more trains will be eight-car consists.*

Public Comment: Increased frequency of feeder bus service would help reduce demand for parking at that lot and generate transit ridership. (0060 0169-13)

> ***Response:*** *The feeder bus plans utilized in the Final EIS reflect the plans and available resources of the bus systems of the two Counties. Revising these services would be the responsibility of Fairfax and Loudoun Counties.*

Capacity and Use of Transit and Highway Facilities

Public Comment: Please compare and contrast the ridership, boarding, and hourly throughput for the proposed Silver Line with the existing Orange Line. Compare the passenger throughput for each line, (one actual, one proposed) with the vehicle and passenger throughput on the Dulles Toll Road and I-66 paralleling both lines. Calculate these figures in a way that can be compared with the collection methodology that VDOT uses to determine the intensity of highway use at particular hours. Conclude from these numbers whether or not the rail lines carry more or less vehicles or people than a pair of adjacent highway lanes. Make this calculation for peak hours and non-peak hours and for the day as a whole. (0061 0117-16)

Public Comment: There are peak hours for rail users. What are the rail volume averages for the Wiehle Avenue station? How does this compare to the volume averages of the adjacent Dulles Toll Road? For

example, does the rail carry more or less the volume carried by the inbound and outbound Dulles Toll Road? (0109 0128-10)

> ***Response:*** *In 2025, peak hour loads at the maximum load point on the Dulles Corridor service under the Full LPA is forecast to be approximately 8,640, while on the Orange Line service it would be approximately 10,100. Each lane of I-66 and the Dulles Toll Road can carry approximately 1,800 vehicles at reasonable free flowing speeds and 2,400 cars at greatly deteriorated service. Assuming average vehicle occupancy rate of 1.1, the two Metrorail lines would carry more people than the adjacent highways.*

Public Comment: We do not believe projections that rail technology will attract three and a half times as many riders as an altered and improved mixed transit system incorporating best available technology. (0061 0136-8)

> ***Response:*** *The travel demand forecast model used to develop the project ridership forecasts utilizes the most recent data on mode preference, based on significant research into this subject. The ridership forecasts reflect these preference patterns.*

Public Comment: We would like to see capacity figures for the current bus system because we suspect it already has substantial excess capacity. (0061 0136-9)

> ***Response:*** *It is the understanding of the Project Team, that certain Fairfax Connector buses between Herndon-Monroe transit center and West Falls Church Station have standees. In general, bus system capacity is based on the frequency of service. The bus service assumed for the No-Build and for the two Build Alternatives is outlined in the Transit Operations and Maintenance Plan prepared in support of the Final EIS.*

Travel Times of Transit Verses Automobiles

Public Comment: The SDEIS claims that transit times will be competitive with auto for many routes, we don't agree with that; most studies say that auto trips are half the time. (0061 0136-6)

> ***Response:*** *The transit travel times or auto travel times identified in the Draft EIS, Supplemental Draft EIS or Final EIS are door to door. Instead, the times are calculated between the centers of transportation analysis zones (TAZ) that represent areas of the region (for instance, Reston is divided into approximately five TAZs). The use of TAZs is typical in travel demand forecasting. Vehicle travel time for automobiles is based on observed data and is included in the demand forecasting modeling package, which attaches a travel time to each link in the regional highway network (this is based on observed data). Transit travel times are based on a detailed simulation package that takes into account station dwell times, number and radius of curves, allowable trains speeds, vehicle acceleration times, number of stations, and distance between stations.*

Public Comment: The SDEIS claims that transit times will be competitive with auto for many routes. Practical experience in driving routes currently served by existing Metro service does not support this assumption. Most businesses in the Tyson's area will be outside of ¼ mile radius from a station that many people believe is an acceptable distance to walk to work. This would suggest that most people would continue to drive to their place of employment. Additionally, express bus service to West Falls Church Metro Station will be terminated if rail is implemented in order to increase passenger ridership. This could have the opposite action of encouraging people to continue driving to employment destinations. (0110 0129-3)

> ***Response:*** *Each of the factors that impact the mode choice of potential riders such as travel time on competing modes and access to final destinations is factored into the travel demand forecasting model. The forecasted ridership results reported in the Draft EIS, Supplemental Draft EIS and Final EIS already reflect these factors. The impacts of changes in bus service to West Falls Church have also been reflected in the model assumptions.*

Transit Travel Time Assumptions

Public Comment: The SDEIS claims that transit times will be competitive with auto for many routes. For door-to door trips, we dispute this claim. Please explain your methodology. (0061 0069-7)

Public Comment: The project team has dramatically overestimated the "travel time savings" of rail over other modes, especially compared with the high-occupancy vehicle (HOV) and transit bus modes from anywhere in the Dulles Corridor to Ballston, Rosslyn, the Pentagon, and downtown Washington, D.C. (0016 0122-15)

Public Comment: The SDEIS claims that transit times will be competitive with auto for many routes. For door to door transportation, we dispute this claim. Explain how you arrived at this conclusion. For what percentage of trips on the corridor would transit travel times be competitive with auto? (0061 0117-7)

> ***Response****: Neither the transit travel times or auto travel times originally identified in the Supplemental Draft EIS and included again in the Final EIS are door to door. Instead, the times are calculated between the centers of Transportation Analysis Zones (TAZs) that represent areas of the region (for instance, Reston is divided into approximately five TAZs). The use of transportation analysis zones is typical in travel demand forecasting. Vehicle travel time for automobiles is based on the demand forecasting modeling package, which attaches a travel time to each link in the regional highway network (this is based on observed data). Transit travel times were based on a detailed simulation package that takes into account station dwell times, number and radius of curves, allowable train speeds, vehicle acceleration times, number of stations, and the distance between stations.*

Parking Impacts on Ridership Forecasts

Public Comment: The number of planned parking spaces appears to have been reduced. How will the ridership projections be met if parking is reduced? (0063 0151-15)

Public Comment: Ridership Numbers are Inflated: Ridership numbers are highly unrealistic because the parking has been slashed at the stations but only meager offsetting adjustments have been made to the ridership which will certainly be reduced commensurate to the parking reductions. (0072 0150-3)

Public Comment: Revise the patronage figures for rail to reflect the removal of the structured parking garage from the Wiehle Avenue terminus. Study the relationship between parking available for suburban locations and usage and project from this study the amount by which use of the Wiehle terminus would be reduced if no new parking were built there. (0061 0117-17)

> ***Response:*** *The travel demand forecasts reported in the Draft EIS, Supplemental Draft EIS and Final EIS take into account the planned park-and-ride capacity at each Metrorail station. Ridership arriving at each station by automobile is constrained, if necessary, by park-and-ride capacity limitations. The Project Team does not anticipate a reduction in the proposed park–and-ride capacity at the Wiehle Avenue Station.*

Transit Travel Times

Public Comment: What will be the increase in travel time for the bus rider who now travels from Reston East to West Falls Church metro but will now have to ride the proposed rail system with four stops in Tysons Corner? (0107 0125-10)

Public Comment: What is the travel time for the rail riders going from the Wiehle station to the West Falls Church Station? How does this compare to the travel time of the present bus riders who use Reston East to get to West Falls Church? Is there an increase in travel time? If so, then using the statement

related to longer transit trips reduces the attractiveness of the transit mode, describe the possible impact to ridership. (0109 0128-11)

> ***Response:*** *The travel times would be similar. Run times for Metrorail from Wiehle Avenue to East Falls Church Stations (the first Metrorail station served by the Dulles Corridor service) would be approximately 15 minutes. Travel time from Wiehle Avenue to West Falls Church Stations via the existing Fairfax Connector 980 service is about 15 minutes. However, people are required to transfer to Metrorail at West Falls Church, thus adding 2 minutes for a total of approximately 17 minutes.*

Transferring Bus Riders to Metrorail

Public Comment: what is the economic impact on the present bus rider who will be forced to take the proposed rail system or return to their automobiles? (0107 0125-12)

> ***Response:*** *Some transit bus riders from south of Tysons Corner on bus routes along Route 7 would be forced to transfer to Metrorail at West Falls Church Station to travel to Tysons Corner. No bus rider from the western part of the corridor within Fairfax County who does not currently transfer to Metrorail would be forced to transfer to Metrorail in the future. The only difference between today's bus operations in the western part of the corridor in Fairfax County and the operations defined in the Final EIS are that people who currently transfer to Metrorail from bus at West Falls Church Station would transfer at Wiehle Avenue Station*

Development Impacts on Ridership

Public Comment: What percentage of ridership from Wiehle station to Tysons corner comes from the former bus riders? (0109 0128-12)

Public Comment: Bus riders will be forced to use rail because the Reston East bus route to West Falls Church will be eliminated. What percentage of ridership from Wiehle station to West Falls Church comes from the former Reston East bus riders? (0109 0128-13)

> ***Response:*** *It is anticipated that most users of the current express service would change to Metrorail. Exact statistics would require a boarding survey after the Metrorail service is in operation.*

Public Comment: The revised DEIS notes that ridership likely would increase 15% with "density bonuses" and that the projections do not include airport users. Consequently, even on a conservative basis the rider ship is understated by at least 20%! (0108 0127-9)

> ***Response:*** *The project's ridership forecasts are based on regionally-adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with Metrorail are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Final EIS. . Airport users are included in the demand forecasts reported in the Final EIS, but may be understated because of the lack of comparable data with which to forecast this ridership, which does not follow typical commuting patterns.*

Budget Impacts on Ridership Potential

Public Comment: WMATA has a $48M deficit in next year's budget, and needs $274.5M for projects labeled urgent over the next five years. This deficit produces a budget headache that could prevent WMATA from running 8 car trains. How will this impact the projected increase ridership on the Orange Line, which requires 8 car trains to meet the projected level of efficiency? (0109 0128-18)

Response: *Under its Metro Matters campaign (, WMATA is presently obtaining funding of its near-term capital needs to sustain the Metrorail and Metrobus systems. Within the $1.5 billion Metro Matters campaign, there is over $600 million for the eight-car train operations.*

Public Comment: WMATA had capital plans to buy 650 new buses and can now only buy 380. Bus routes are being eliminated. For every 10% fare increase ridership drops by 0.36% The fare increases and the increase in parking fees are reality issues. Describe how these issues were factored in for ridership projections for 2009? (0109 0128-19)

Response: *All factors that impact on mode choice, including fares, parking fees, and the bus network (factors identified by the commenter) are fundamental elements of the demand forecasting model. Assumptions regarding these factors are implicit in the demand forecasting results.*

Ridership for Work Trips

Public Comment: What percent of the riders who work in the Tyson's Corner area will use the proposed rail from Wiehle Avenue Station to reach their place of employment? (0109 0128-2)

Public Comment: Residents in the Washington region now use transit for about 4.5% of all daily trips. (Washington Post, B-9, 7/17/02) What percent of the employees who work in the Tyson's area will use rail to reach their place of employment? (0109 0128-1)

Response: *This data is shown in Chapter 6 of the Final EIS. The transit share of all trips to Tysons Corner under the proposed Wiehle Avenue Extension is approximately 13 percent.*

Maintain Current Bus Services

Public Comment: Will the present bus service from Reston East to West Falls Church be eliminated? (0107 0125-11)

Response: *Under both the proposed Wiehle Avenue Extension and the Full LPA, bus service that currently serves the Reston East Park-and-Ride before continuing to West Falls Church would terminate at the Wiehle Avenue Metrorail station.*

Consider Impacts of "Just in Time" Carpoolers

Public Comment: Determine the number of just in time carpoolers (sluggers) using Herndon Monroe parking station or any other stop. Compare this use of slugging with that experienced along the Shirley Highway. Revise the no-build alternative numbers to incorporate formalized slugging to attract at least the same percentage of commuters as the Shirley Highway. How will this affect peak hour public transit demand? (0061 0117-14)

Response: *The issue of "slugging" in the Dulles Corridor was addressed in the Public Hearings Report for the Draft EIS. The issues associated with implementing just-in-time ridesharing zones in the Dulles Corridor and the possible benefits of increased HOV were explored as part of the Project Team's review of Dulles Plan B. Neither the Project Team nor VDOT could develop facilities with the express purpose of encouraging just-in-time ridesharing (also known as "slugging" or casual carpooling) because of the tremendous liability risk associated with such activities. While these agencies recognize the benefits that have been gained in the I-95/I-395 corridor through this informal ridesharing arrangement, the random pairing of drivers and passengers inherent in this form of commuting presents risks that most public agencies are not prepared to assume.*

Ridership Estimates Seem Overly Optimistic

Public Comment: A defensible and objective ridership analysis needs to be included in the SDEIS. The projected ridership data is unrealistic (e.g., at 2-17 and S-12 and TABLE 2-2). The authors have failed to present a defensible basis for inflated ridership data. (0068 0173-15)

Public Comment: Many of us would question ridership forecasts as wildly optimistic, even with massive development or redevelopment of rail oriented sites. Plans for the Wiehle Avenue site are the densest in all of Reston, with an FAR of 2.5. As VDOT said in its critique of the original DEIS, while rail might produce some slight alleviation of East-West congestion, north-south roads will be overwhelmed by density increases. (0096 0112-3)

> ***Response:*** *The methodology for completing the ridership forecasts were outlined in detail in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002) prepared parting support of the Draft EIS. This same methodology was used in the Final EIS analysis as well. This modeling methodology is based on commonly accepted and widely used forecasting techniques applied on projects throughout the United States. Further, the forecast results have been calibrated to existing ridership on Metrorail, thus providing an additional measure of accuracy.*

6.2 Effects on Roadways

A. Draft EIS Comments

State Agency Comments

Include Roadway Improvements in CLRP

State Comment: Pg. 6.6, 2nd to last paragraph: "VDOT is planning several major roadway improvements along Routes 7 and 123 in Tysons Corner . . .. Widening of Routes 7 and 123, and the construction of grade-separated interchanges at Route 7/Westpark Drive, Route 7/International Drive, and Route 123/International Drive . . . By 2010." (Recall 8/4/00 letter by Tom Farley, included in report's Appendix, asking that the team consider and evaluate the improvements planned by 2010 that are included in the Fairfax County Comprehensive Plan and the regionally adopted Constrained Long Range Plan CLRP). (0421, 0421-A –18)

> ***Response****: All improvements planned by the opening year and forecast year of the two Build Alternatives of the Final EIS that are included in regional transportation plans are considered in the analysis that support the Final EIS. The exceptions are the proposed interchanges of Route 7 and Route 123 in Tysons Corner as identified by the Fairfax County in its Comprehensive Plan. Those interchanges are not yet recognized by regional plans. All improvements included in the regionally adopted Constrained Long Range Plan that are located in Fairfax County are included in the analysis.*

Local Agency Comments

Traffic Impacts on Access Roads to Stations

Local Comment: In other words, what good is this transit system if you can't get to it? And you can't get to it unless you address systematically the neighborhood streets, the transit services that provide transportation, conceivably, to this important new addition to the region, and in otherwise provide for a much greater area than is provided for now. We know that the highways in the area that potentially would be accessed for this system are already significantly under stress and, frankly, break down regularly as effective transportation corridors. And those include Route 7, Route 29, Route 66, and many other neighborhood highways. (0165, 0165-T –6)

Response: *The Project Team agrees that the Metrorail Extension will not resolve traffic gridlock; however, it would provide an alternative to driving the automobile, which in turn would help to improve air quality in the corridor. As outlined in Chapter 6 of the Final EIS, the Metrorail Extension will substantially increase the transportation capacity of the corridor (i.e., the number of travelers that can be comfortably accommodated in the corridor during peak travel times), relative to the No-Build Alternative. In theory, every "new rider" generated by this project would result in one less automobile on the Dulles Toll Road or other regional roadways.*

More Intersections Should Be Studied in the City of Falls Church

Local Comment: Impacts - The traffic impacts are more far reaching than the intersections studied. The City [of Falls Church] had requested that thirteen (13) key intersections be studied and is disappointed to find only three (3) were considered. The City continues to believe this project may have a significant impact on Falls Church and its environs requiring analyses that would include secondary and cumulative effects of traffic increases through existing neighborhoods. This potential for increased commuter "cut through" traffic needs to be monitored and will require the collection of additional traffic counts. (0122, 0122-A –15)

Response: *The three intersections included in the traffic analysis for the Orange Line Connection section of project corridor were selected based on their proximity to the West Falls Church Metrorail Station. These three major intersections are directly adjacent to the station and have the potential to experience the greatest impact, if any, from the project. Based on the results of the analysis, it can be inferred that the intersections directly adjacent to the three under study would also receive the same impact since they are located in close proximity to each other. Moreover, the further away the intersections are located from the station area, the less likely project-related impacts would be felt.*

A secondary effect is an indirect effect. In other words, they are caused by the proposed action, but will occur later in time or further in distance than the other direct impacts from the project. With regard to the Dulles Corridor Rapid Transit Project, secondary effects would be those resulting from the increased density of development that would occur because local government have plans in place that allow for greater density in some areas if transit is provided (known as density bonuses). These effects could include increased traffic congestion. While it is expected that increased density will result in localized traffic congestion in some of the station areas, the new transit-oriented urban form will help to increase the overall mobility in the corridor, counties, and the region. The Project Team, however, disagrees that secondary traffic would be a problem for the residents of Falls Church. Secondary and Cumulative impacts of transit-related growth were analyzed in Chapter 9 of the Final EIS and the *Economics and Secondary Development Effects Technical Report (June 2002). No assessment of secondary development impacts was undertaken for West Falls Church because density bonuses are not allowed in this area.*

The Project Team did not analyze the potential for overflow parking nor cut-through traffic on neighborhood streets. The Project Team did initiate meetings with the City of Falls Church to discuss these issues.

Local Comment: Equity - The City [of Falls Church] is more directly impacted than other communities, but these impacts were not analyzed at the same level of detail as the proposed Metro stations. Unlike the planned stations in Tyson's Corner, the impact of traffic overflow will be felt on adjacent residential streets causing safety concerns for our residents. It is puzzling to then contrast that only the three (3) directly adjacent intersections at the West Falls Church Metro area were analyzed, whereas, for the new stations, as many as nine (9) and an average of five (5) adjacent intersections were analyzed. (0122, 0122-A –16)

Response: *As part of the Dulles Corridor Rapid Transit Project, four stations are anticipated to be constructed in Tysons Corner, some of which would have overlapping station area impacts.*

Relative to the City of Falls Church and the other sections of the corridor, the effects of the project on the Tysons Corner area would be much greater than that at the West Falls Church Station. Metrorail service is currently provided for the West Falls Church Station and no project improvements are planned there for either Metrorail Alternative. As shown in Chapter 6 of Final EIS on average, three to four intersections were analyzed for each of the Mid-corridor and Loudoun County Stations. More intersections may have been analyzed due to station facilities (i.e., Kiss & Ride and park-and-ride spaces) being provided on the north and south sides of the Dulles Toll Road.

The three intersections included in the traffic analysis for the Orange Line Connection section of project corridor were selected based on their proximity to the West Falls Church Metrorail Station. These three major intersections are directly adjacent to the station and would therefore experience the greatest impact, if any, from the project. Based on the results of the analysis, it can be inferred that the intersections directly adjacent to the three under study would also receive the same impact since they are located in close proximity to each other. Moreover, the further away the intersections are located from the station area, the less likely project-related impacts would be felt.

Traffic Impacts May Limit Development Potential in the City of Falls Church

Local Comment: Safety/ Infrastructure - The City is unique in that the West Falls Church Metro area is directly adjacent to City owned property, which includes the George Mason Middle and High Schools, as well as the UVA/ Virginia Tech Grad Center. - Assumptions - The assumption that failing roadways should accommodate more traffic without improvements is flawed. One of the major goals of the Project is to support future development. However, in reality, the Project may actually prohibit such future development in the area and severely limit the City's [of Falls Church] future economic development potential because existing roads are now operating at near or full traffic capacity. (0122, 0122-A –21)

Response: *It is not the responsibility of the Dulles Corridor Rapid Transit Project to mitigate existing traffic/roadway capacity problems. The Final EIS does not assert that failing roadways should be able to accommodate more traffic without improvements. Chapter 6 of the Final EIS states that increases in vehicle trips are not anticipated for the West Falls Church Station as a result of either of the two Build Alternatives. . This is primarily a result of the addition of transit park-and-ride capacity in the mid-corridor. Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.*

Traffic and Mitigation Measures Not Fully Addressed for the City of Falls Church

Local Comment: Mitigation measures - Table 6.2-6, "Summary of Traffic Issues and Proposed Mitigation Measures," does not address or consider Falls Church traffic issues or propose mitigation measures. (0122, 0122-A –17)

Response: *The Dulles Corridor Rapid Transit Project will not substantially expand service at either the East or West Falls Church Metrorail Stations. The Final EIS states that large increases in vehicle trips are not anticipated for the West Falls Church Station area for either of the Metrorail Alternatives. This is primarily due to the addition of transit parking elsewhere in the Dulles Corridor. Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.*

Public Safety and Infrastructure Not Addressed for the City of Falls Church

Local Comment: Equity- Public safety and infrastructure improvements are included in the EIS recommendations for many other impacted areas, but not for the City of Falls Church. (0122, 0122-A – 23)

Local Comment: The draft EIS has failed to adequately address public safety and infrastructure issues regarding pedestrian traffic, especially students conflicting with vehicular traffic in and around the West Falls Church metro station, given the prediction for increased vehicle trips per day. Our middle school and high school are adjacent to that station. (0122, 0164-T –5)

> ***Response:*** *As stated in Chapter 3 of the Final EIS, the study area for safety and security was the limit of disturbance for the Metrorail Extension. Since neither the West Falls Church nor East Falls Church Metrorail Station would require major improvements as part of the Extension, these stations fall outside the limit of disturbance and therefore were not analyzed. In addition, the Final EIS states that increases in vehicle trips are not anticipated for the West Falls Church Station area for either of the two Build Alternatives. This primarily would be due to the addition of transit parking in the Mid-corridor.*
>
> *Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.*

Hours of Delay Measure

Local Comment: Hours of delay may provide a more realistic and meaningful measure of traffic impacts than the LOS and seconds of delay measure used in the DEIS. (0479, 0479-L –4)

> ***Response****: Comment noted. Since the review period of the Draft EIS, FTA has instituted a measure of travel time savings in hours for its evaluation of New Starts projects.*

Potential Impacts to City of Falls Church

Local Comment: I am pleased to provide the following "Impact Evaluation" for the referenced draft EIS report dated January 28, 2002 (including revised Section 8.0 dated March 15, 2002). This brief evaluation reviews this EIS report in consideration of possible impacts to the City of Falls Church, particularly the affected Metrorail stations and environs with the City of Falls Church. Based on my evaluation of this report (and revised Section 8.0 attachment), I offer the following observations and comments (presented in order by Section of the EIS report):

Section 1.0 -- No comment.

Section 2.2 -- It is noted that the BRT alternative includes modification to the West Falls Church Metro Station.

Section 3 -- No comment.

Section 4 -- No comment.

Figure 5-1-- At the Haycock Rd./Falls Reach Drive intersection, it is shown that the predominant AM inbound flow is from Great Falls Street, yet the predominant PM outbound flow is to the other direction (towards Rt.7). This is a curious traffic pattern where the predominant outbound trips (from West Falls Church Metro Station) are opposite of the predominant inbound trips. This should be explained further.

Figure 5-17 -- At the Haycock Rd./Falls Reach Drive intersection, there are "movements" going into an unmarked road opposite Falls Reach Drive. Perhaps this unmarked road is one-way, yet nothing is shown on this graphic. This should be explained further.

Section 5.3.2 - Roadway analysis was performed for eight (8) roadway segments, not including Rt. 7 near Falls Church (e.g., near Haycock Road). Why not? It seems this important eastern end of the study area should have been included.

Section 6.1 -- Level of Service (LOS) analyses were conducted for selected highway links, but not Rt. 7. Why not? Again, it seems this important highway corridor within the study area should have been included.

Section 7.1 -- A general statement is made that "…traffic impacts within the Orange Line Connection sub area of the corridor are not expected to be significant." On what basis is this general statement made? On what proof or evidence can this be made?

Section 7.1 -- It is stated that "…no formal analysis of park/kiss-and-ride entries and exits or the nearby local road network was undertaken for the East Falls Church metro station area…" due to insignificant increase in traffic near the station, yet it is also stated that "…implementation of either the Metrorail or BRT/Metrorail Alternative would result in increased off-peak service frequencies at East Falls Church for eastbound trains…" These statements seem contradictory. An explanation of how increased off-peak service creates no significant increase in traffic near the affected station needs to be clarified.

Section 8.2 (March 15, 2002) -- It is stated that none of the planned changes to the West Falls Church Metro station are assumed in the analysis, yet no explanation is provided as to why? Also, isn't a parking garage being planned/programmed for this station? If so, why isn't this included in the analysis?

Table 8-1 (March 15, 2002) -- This table shows exactly the same LOS and delay for the RT.7/Haycock Rd. and Haycock Rd./West Falls Church Station Parking Entrance intersections during the AM and PM peak hours for the 2025 Baseline condition. It is highly unlikely that this coincidence would occur. This needs to be checked and verified.

Section 8.3.1 (March 15, 2002) -- Under the "BRT Alternative" it is stated twice that the Rt. 7/Haycock Rd. intersection would improve to LOS C in the PM peak hour. I believe that this applies to the AM peak hour as well (per Table 8-1).

Section 8.3.1 (March 15, 2002) -- Under the "BRT Alternative" it is stated that "…any of the build alternatives would reduce the demand for parking at the West Falls Church Station …", yet no evidence is presented to support this finding.

Section 8.3.2 (March 15, 2002) - It is stated here that "…only selected intersections and station entrances/exits are analyzed." It is curious why the most impacted intersection in the West Falls Church Metro Station area (Great Falls Rd./Haycock Rd. intersection was not part of the analysis.

Section 8.3.2 (March 15, 2002) -- It is stated here that "…because it is the controlling time period for the design year, only the PM peak hour conditions have been analyzed…" Since the area near the West Falls Church Metro Station (i.e., Rt.7/Haycock Rd. intersection area) is directly influenced by the adjacent educational facilities, thus directly and strongly influenced during the AM peak hour much more than the PM peak hour, it is questionable why only the PM peak hour was analyzed, and not the AM peak hour.

Section 8.5 (March 15, 2002) -- It is stated that since "… the project is not anticipated to have a negative impact on adjacent intersections, analysis of pedestrian and bicycle access and circulation was not undertaken." In light of prior comments and uncertainties, it is not necessarily factual that no negative impact has been afforded at adjacent intersections, thus perhaps pedestrian and bicycle access and circulation should be conducted.

Section 8.6 (March 15, 2002) -- It is claimed that the measured "delay" impact is not significant enough to warrant mitigation. Under what criteria is this based? This seems to be objective.

Figure 8-1 (March 15, 2002) The predominate PM peak hour traffic flow out of Falls Reach Drive is contrary to that shown in Figure 5-1. Which is correct?

Section 22.0 -- It is noted that the study only accesses the potential effects of development near the Tysons Corner and Mid-Corridor areas. Apparently no development is forecast near the Falls Church Metro Stations. This needs to be verified with the City.

Section 22.2 -- It is noted that "… the increase in traffic attributable to the rail development-related forecasts represent area-wide impacts." It is curious whether these area-wide impacts reach to Falls Church Metro Station areas.

Section 22.2 -- The final paragraph of the report states that development will result in increased ridership and also attract additional traffic to adjacent roadways. Does this apply to roadways near the Falls Church Metro Stations? This needs to be clarified. (0122, 0122-A –31)

> ***Response:*** *The Project Team addressed and verified these comments (which were made on the January and March 2002 draft versions of the Traffic Analysis and Station Access Technical Report). The Project Team also initiated meetings with the City of Falls Church to discuss these issues.*
>
> *Section 6.1. The links included in Table 6-1 were a sample of the important highway links in the project area. The table was not meant to be comprehensive of all heavily traveled links in the corridor. The links included in the table were selected based on their proximity to the BRT and Metrorail alignments, and were adjusted to be links most affected by implementation of the Build Alternatives.*
>
> *Section 7.1. The general comment in Section 7.1 regarding limited impacts was based on two different sources. With regard to East Falls Church, the comment was based on the fact that there will be no change in parking capacity at the East Falls Church Station as a result of the project, and thus there will be no change in the primary generator of auto trips to and from the station. There would be changes in traffic levels because of general population and employment growth, but these changes would not be the result of project implementation. With regard to the West Falls Church Station, the comment was based on traffic analysis contained in Chapter 8 of the Traffic Analysis and Station Access Technical Report (June 2002). The data in Chapter 8 showed very marginal changes in traffic volumes as well as very marginal changes in intersection levels of service (in some instances intersection delays actually improve slightly).Section 7.1. The most predominant generator of auto traffic to and from the East Falls Church Station is the park-and-ride facility. No changes to the capacity of the lot are planned as part of the Metrorail Extension. Furthermore, the facility typically fills up by 8 a.m. Therefore the major generator of auto trips to the station essentially would not generate trips after 8 a.m., regardless of the change in service frequencies.*
>
> *Section 8.2. Changes to the station and associated facilities resulting from implementation of the project were incorporated in the analysis. Other changes to the station must be part of the region's Constrained Long Range Plan in order to be included in the analysis. The new park-and-ride structure for West Falls Church is included in the No-Build Alternative but has not been considered a project impact.*
>
> *Table 8.1. These data were checked and verified; the data in the table was correct.*
>
> *Section 8.3.1. Comment noted. BRT was eliminated from further consideration after the public and agency review and comment on the Draft EIS.*
>
> *Section 8.3.1. Parking demand at each station under the two Build Alternatives is contained in the Patronage Forecast Report in support of the Final EIS. As an example, parking demand at*

West Falls Church under the No-Build Alternative is estimated to be 1,950 spaces. Under the LPA demand would be approximately 2,000 spaces.

Section 8.3.2. The Great Falls Street/Haycock Road intersection is included in the Final EIS analysis.

Section 8.3.2. The traffic analysis contained in the Final EIS is based on 2025 traffic levels. Both the a.m. and p.m. peak hours were analyzed for all relevant intersections for the design year 2025.

Section 8.5. Responses to prior comments have shown the adequacy of the traffic analysis completed for West Falls Church. Therefore the decision to not undertake bicycle and pedestrian access analysis was reasonable.

Section 8.6. The determination that mitigation is not required is based on the fact that the intersection will fail in 2025 regardless of whether the project is built. Mitigation to improve intersection performance would require improvements to address not only the incremental delay resulting from project implementation but also the delay and deteriorated intersection performance resulting from general population and employment growth. Improvements to address growth are not the responsibility of the project.

Figure 8.1. Figure 5.1 in the Traffic Analysis and Station Access Technical Report (June 2002) represented current traffic flows and volumes while Figure 8.1 represented flows and volumes for 2025. The differences between the two figures represented changes in the location of population and employment concentrations in the station area and the region as well as changes in roadway operations (which impact on travel path choice) in the station area and the region.

Section 22.0. The analysis outlined in Chapter 22 of the Traffic Analysis and Station Access Technical Report (June 2002) was completed specifically to understand the impacts of the transit-oriented density bonuses allowed for Tysons Corner and Reston because these are the locations where the density bonuses are allowed.

Section 22.2. Some impacts from additional traffic generated by density bonuses in Tysons Corner may be expected in Falls Church, though they will be much less than the impacts in Tysons Corner. This is because trips generated in Tysons Corner will have dispersed origins and therefore will take multiple travel paths. As a result, only a small percentage of the trips generated in Tysons Corner will travel through West Falls Church. Impacts from overall population and employment growth will be much more significant.

Section 22.2. See comment above.

Concerns About Traffic Impacts at East and West Falls Church Stations

Local Comment: The draft EIS did address one critical area of concern to the City [of Falls Church] -- Traffic Analysis and Station Access for the West Falls Church Metro area. While it generally addresses some concerns, we believe it falls short in its analysis. Please let me reiterate the City's critical concerns as related to this Technical Report:- Traffic- The traffic generated by this project will greatly diminish the quality of life of our residents. We asked that the City's [Falls Church] traffic consultant review and analyze the EIS. His comments are attached (Attachment 5). It is of great concern that nineteen (19) separate technical issues were identified as needing to be rectified or clarified. Our consultant states that these "shortcomings, inconsistencies, and concerns/questions are found to be rather troublesome. (0122, 0122-A –13)

Response: *Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.*

The Project Team has reviewed the comments from the traffic consultant for the City of Falls Church and addressed his comments above. Overall, the consultant found the Technical Report was "comprehensive and well done – mostly within the standard methodologies and criteria."

Traffic at East and West Falls Church Stations

Local Comment: It is our understanding that the Dulles Corridor Project is a phased regional rapid transit project with planned station facility improvements within the East and West Falls Church Metro Station areas. Given this understanding, we firmly believe that this project will have a substantial vehicular traffic impact on the City as the East and West Falls Church Metro Stations transform into a major regional transportation/transit hub in the future. From the outset, the City has been concerned that the Project will bring thousands of additional motorists into the City, and urged that plans must be made to accommodate the additional traffic. (0122, 0122-A –8)

Local Comment: We firmly believe this project will have a substantial vehicular traffic impact on the city as the East and West Falls Church metro stations transform into a major regional transportation hub in the future. From the outset the city has been concerned that the project will bring thousands of additional motorists into the city, and urges that plans be made to accommodate the additional traffic. If these motorists drive to stations and cannot find parking, they will try to park on the residential streets, creating a significant impact on the surrounding neighborhoods. The city has repeatedly requested that these impacts and others be anticipated and addressed. 0122, 0164-T –8)

Local Comment: It is our view that the traffic impacts [in Falls Church] were not fully analyzed in four key areas: Assumptions - We believe the assumption that ridership will not increase and the assumption that failing intersections should not be improved is fundamentally flawed. Every projection throughout the EIS shows thousands of anticipated new riders. One of the project's major goals is to increase ridership and, certainly, at the starting point for the service, additional persons will be traveling to this destination. (0122, 0122-A –14)

Response: *The Project Team used the Northern Virginia Major Investment Study Model (NVMISM) to forecast the regional travel demand in the Dulles Corridor. This model was refined for use during the Dulles Corridor Rapid Transit Project, but had been last used for the Metrorail I-66 to Centreville MIS. NVMISM was developed using the general guidelines of the Metropolitan Washington Council of Governments (MWCOG) for a major update of the region's travel demand forecasting procedures, and has been considered to be a state-of-the-art model. Inputs into the model include an analysis on regional travel markets, which included private automobile use, public transit, public taxis, and walking/bicycle trips. The model also included demographic and land use data from MWCOG's Round 6.3 Cooperative Land Use Forecasts. By taking all of these items into consideration, through the use of the model, the Project Team has been able to project the ridership for each Metrorail station in the corridor. While the model outputs show that ridership at some stations will be higher than others, these forecasts are based on empirical data, and therefore portray the most accurate account of what will be happening in the corridor over the next 25 years.*

Implementation of the Project would result in increased off-peak Metrorail service at the East Falls Church Station. However, operating plans for the Wiehle Avenue Extension and Full LPA assume no additional feeder bus service, nor any new park-and-ride capacity for the off-peak period for this station. Because the station's existing park-and-ride facilities are typically full by 8:00 AM on most weekdays and parking is controlled on local streets, it is not anticipated that increased off-peak Metrorail service would generate additional traffic in and around the East Falls Church Metrorail Station. Based on the analysis of the forecast ridership volumes for the East and West Falls Church Metrorail Stations, the Project Team does not feel that overflow parking onto residential streets will be a problem. Moreover, since completion of the Draft EIS analysis, WMATA has programmed a 960-space parking facility at West Falls Church to be completed in early 2005. This new facility is part of the analysis in support of the Final EIS. The Project Team

did initiate meetings with the City of Falls Church to discuss the issues of overflow parking and cut-through traffic.

Public Comments

Traffic Impacts of Median Alignment

Public Comment: Is the proposed median alignment likely to reduce or increase automobile traffic? (0151, 0297-E –7)

Response: *Because of forecast increases in population and employment growth, traffic will consistently increase throughout the region over the next 20 years. However, as the Final EIS indicates, traffic on many of the regional highways, will not be increasing as a result of the Dulles Corridor Rapid Transit Project although there could be slight increases in localized traffic at intersections directly adjacent to some of the stations. This Project is intended to provide an alternative mode of travel in the corridor to alleviate the effects of increased congestion.*

Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.

Route 123/International Intersection

Public Comment: I don't even want to think about the mess that would be created if the intersection of 123 and International were to be disrupted. (0054, 0054-CC-1)

Response: *Construction impacts on roadways as a result of the project are discussed in Chapter 6 of the Final EIS. Proposed roadway mitigation measures for the two Build Alternatives are also detailed in the Final EIS.*

Capture Traffic Further West

Public Comment: There are link studies contained within the DEIS that indicate in the year 2025, the Dulles Greenway will have a LOS of F. To mitigate this congestion, sound traffic planning principles would dictate the necessity to capture as much of the planned residential traffic as far west on the Greenway as possible (i.e., the Route 772 station). (0003, 0003-L –3)

Public Comment: The traffic analysis contained within the draft environmental impact statement indicates failing levels of service at the 606-789 intersection. To mitigate this congestion, sound traffic planning principles would dictate the necessity to capture as much of the planned traffic as far west on the greenway as possible, or the Route 772 station. (0003, 0246-T –4)

Response: *As initially evaluated in the Supplemental Draft EIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team reconfigured the park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces. Intersection LOS in the vicinity of the Route 606 station in 2025 will be F in both the No-Build Alternative and the Full LPA. The Project has proposed roadway improvements as mitigation measures.*

Traffic Signal Placement

Public Comment: Will traffic control signals be placed on dangerous intersections that are currently uncontrolled, such as Idylwood Road and Redd Road at the WFC S&I entrance? (0424, 0424-E –5)

Response: *It is not the responsibility of the Dulles Corridor Rapid Transit Project to mitigate existing traffic or intersection issues. Although additional storage tracks will be constructed at the West Falls Church Yard impacts to traffic will be negligible. Therefore, the Project Team does not anticipate any Project-related traffic impacts at this intersection.*

Concern About Traffic Impacts Near West Falls Church Station

Public Comment: The second issue is the effect of increased traffic on our streets. This includes safety impacts, congestion impacts, parking impacts, and air quality impacts. As it pertains to the primary streets directly surrounding our development (Haycock Road, and the Metro Service Road), these have not been addressed in the EIS because our property was simply not considered significant, in spite of our critical location. The report is similarly deficient in laying out what will be done to mitigate congestion and secondary effects from nearby and highly important intersections, such as Haycock-Great Falls and Haycock-Route 7, which we routinely use and which directly affect our local travel. (0126, 0126-E –5)

Public Comment: In speaking with the consulting representatives at the public meetings, and we don't find anything to the contrary in the EIS, the popular response to these fears is that the net effect is that there will be no traffic increases around West Falls Church; i.e., the motorists who now drive to and park at West Falls Church station are from communities along the proposed line, and when the project is built, those motorists will no longer drive here or will park at their new Metro parking lots. This may indeed happen, but to suggest that there will be decreases in traffic at West Falls Church is ludicrous. It flies in the face of the very justification used for the Dulles Corridor project; i.e., that traffic will continue to increase dramatically in the next 10-20 years. As they say in the movies, "If you build it, they will come", if for nothing more than to use West Falls Church as a parking and debarkation point to get to East Falls Church and then double back on Metro to Dulles or wherever. (0126, 0126-E –6)

Public Comment: I mentioned our concerns about traffic. We feel that your study methodology was flawed because of the limited areas you study. We anticipate widespread effects in the entire area surrounding the transit station and we feel your report does not adequately address the potential impacts on our neighborhood roads. (0145, 0145-T –10)

Response: *The three intersections included in the traffic analysis for the Orange Line Connection segment of the project corridor were selected based on their location relative to the West Falls Church Metrorail Station. These three major intersections are directly adjacent to the station and would therefore experience the greatest impact, if any, from the project. Based on the results of the analysis, it can be reasonably inferred that the intersections adjacent to the three analyzed in the Final EIS would also experience the same impact since they are located in close proximity to the analyzed intersections.*

Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.

Mitigation measures were proposed for those intersections that would have unacceptable levels of service (LOS E or F) and delay times five or more seconds or five percent greater than those experienced for the No-Build Alternative. Based on the analysis, mitigation would not be warranted at Route 7/Haycock Road, Great Falls Street/Haycock Road or at the Haycock Road/Park-and-Ride entrance under the two Build Alternatives. At these locations, levels of service and delay times are improved or only slightly more than those for the No-Build Alternative.

Traffic Impact at Wiehle Avenue Station

Public Comment: The station on Wiehle is going to impact Inlet Cluster, Inlet Court, because there is a curve approaching that intersection. There is no traffic light. The speed limit is 20 or 25 miles an hour. No one adheres to it. The speed limit on the rest of Wiehle is 35. Most of the traffic goes at 50. We have had, over the 31 years of the Cluster, deaths on that intersection. They do not show up because they have been over time. (0288, 0288-T –1)

> ***Response:*** *While traffic volumes are expected to increase at the intersections directly adjacent to the Wiehle Avenue Station, the increases will be due largely to the forecast population and employment growth forecast for this area, as indicated in Chapter 6 the Final EIS. The Wiehle Avenue/Inlet Court intersection was not analyzed for this study because it is located approximately one mile from the proposed station location; therefore, Project-related effects at this location would be minimal.*

Impacts To Route 7 Service Roads

Public Comment: The proposed location of the garage also could alter the circulation pattern in the area, potentially eliminating or restricting use of the service road along westbound Route 7, which, as noted on page 2 above, is the singular access point to the TMS property. Section 14.1 of the Traffic Technical Report indicates that the Virginia Department of Transportation intends to widen westbound Route 7 between Westpark Drive and the DAAR from its current three (3) lanes to four (4) lanes. Drawing GPN-C-213 (Page 272) of the DEIS exhibits appears to incorporate these improvement with the design of the parking structure. Indeed, the service road appears to shift to the east while eliminating three (3) existing curb cuts from westbound Route 7, including the entrance that serves the Toyota Property and the TMS Property. Although the DEIS and Traffic Technical Report do not explicitly acknowledge the effect this widening will have on the Route 7 service road, we have been told the planned widening could modify the operation of the service road on westbound Route 7 to a "one-way" only road. Were this widening and change in traffic to occur, patron of Koons Toyota, Tysons Self Storage and the TMS Property no longer would have clear ingress/egress to their properties. As noted above, the service road is the only means to and from the private access easements benefiting the Property. This effect appears not to have been considered as part of the DEIS. (0135, 0391-L –16)

Public Comment: How does the DEIS envision the functioning of the westbound Route 7 service road in the event the parking garage at the Tysons West station is constructed? (0135, 0391-L –23)

> ***Response****: The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. The BRT/Metrorail and Phased Implementation Alternatives were eliminated from further consideration after the public and interagency review and comment on the Draft EIS. Therefore, the Project is no longer affecting the TMS Property nor Tysons Self-Storage.*
>
> *The park-and-ride at Tysons West Station has been reduced from 2,000 to 500 spaces specifically in response to concerns regarding traffic impacts. The 500-space park-and-ride would be part of a joint development project, so the private sector would be involved in the design and development. However, the specific location and design is not yet known.*

Construction Impacts to Tysons Corner Businesses

Public Comment: The other Host Marriott hotel will be negatively affected by the rail project is the Ritz-Carlton, Tysons Corner. Our concern is not only for this hotel but also the economic impact on the neighborhood, as people avoid the construction and traffic congestion at Tysons Boulevard and Route 123 where the Tysons Central Station is to be developed. Part of the success of our business is dependent upon providing customers an easily accessible location and we anticipate that the construction of this station will likely cause us to lose customers, given that it will interfere with the hotel's primary access along Tysons Boulevard. We acknowledge that the issue is not unique to us and that the retail

elements of the neighborhood will likely be impacted as well. As such, we suggest that appropriate efforts be made to ensure that the construction of this station be planned and phased in a manner that minimizes traffic detours and congestion along an already crowded Route 123 and Tysons Boulevard intersection. (0453, 0453-L –3)

> ***Response****: During the preliminary engineering and final design, maintenance of traffic plans will be developed to minimize any impacts to local area roadways, including the intersection of Tysons Boulevard and Route 123. Access to the hotel will be maintained along Tysons Boulevard so minimal long-term economic impact is anticipated for either the hotel or other retail facilities. In general, the mobility benefits of providing a transit station in close proximity to retail facilities and hotels outweigh any adverse traffic effects.*

Traffic Impacts During Construction

Public Comment: What are the impacts on corridor traffic during the construction phase of any of the alternatives? (0235, 0235-E –7)

> ***Response****: As discussed in Chapter 6 of the Final EIS the construction of the Metrorail Extension would require intermittent lane closures on some local roads through Tysons Corner and Dulles Airport, as well as on regional facilities such as the DIAAH, Dulles Toll Road, and Dulles Greenway. As stated in Chapter 6, of the Final EIS, maintenance of traffic plans would be developed for all construction activities that would impact regional and local roadways. To the extent possible, all construction requiring lane closures would be done at night, on weekends, or in the off-peak period.*

Noise and Traffic Generated During Construction

Public Comment: Will the noise and traffic generated by construction and construction vehicles be restricted in hours of operation and noise and light levels? (0424, 0424-E –4)

> ***Response****: Implementation of the Metrorail Extension would result in some disruptions to the operation of the transit and highway facilities in the corridor, as well some short-term noise impacts. Maintenance of traffic plans would be developed for all construction activities that would impact roadways. To the extent possible, all construction requiring lane closures would be done at night, on weekends, or in the off-peak period. Also, construction traffic would be re-routed, to the extent possible, along roadways in order to minimize noise impacts to nearby sensitive receptors.*

Specific Mitigation Needed for Roads Adjacent to Stations

Public Comment: What is the impact on both the region and individual communities in regards to shift in traffic, overflow parking, and increased traffic on feeder roads? Be more specific in identifying mitigation measures and the cost/funding sources for these measures. (0147, 0459-L –14)

Public Comment: The DEIS further states there will be deterioration around intersections in the vicinity of the Wiehle Avenue station and the Reston Parkway Station. Mitigation proposals include widening streets, build more turning lanes and build more ramps. The project team failed to adhere to the principles of cumulative effects analysis. Therefore, the analysis of the cost of the recommended mitigation measures should be factored into the equation and this analysis should be made available in the DEIS. Conceptual cost estimates should be prepared for the construction and implementations of the mitigation measures. Identification of funding sources should be determined. (0147, 0459-L –22)

Public Comment: Historically, transit rail systems do not reduce traffic congestion. In the modern American areas, traffic analysis reveals that increasing residential and commercial densities is largely incompatible with reducing traffic congestion. Citizens living around the transit stations have major concerns that the proposed rail strategies will have virtually no impact on the traffic congestion along the

Dulles Corridor. In addition, they are concerned that the excessive cost of the rail option could deny putting in place the mitigation measures proposed in the DEIS. (0147, 0459-L –26)

***Response**: Over the next twenty years, congestion in the Dulles Corridor and the region will be increasing due to the increases in forecast population and employment growth. The Dulles Corridor Rapid Transit Project would provide an alternative mode of transportation within the region. While it is stated in the Final EIS that the project most likely would not solve the current congestion problems on the Dulles Toll Road and other regional roadways, the project would increase the transit capacity of the region as a whole. As outlined in Chapter 6 Final EIS, the Metrorail Alternative would substantially increase the transit capacity of the corridor (i.e., the number of travelers that can be comfortably accommodated in the corridor during peak travel times), relative to the No-Build Alternative. In general, every "new rider" generated by this project would result in one less automobile on the Dulles Toll Road or other regional roadways. As Table 6.2-1 in the Final EIS shows, the 2025 traffic volumes on some of the regional highways with the Metrorail Extension would be comparable to the 2025 No-Build Alternative volumes, with the majority of the link volumes only slightly decreasing for the Build Alternatives. Only volumes on the DIAAH would decrease enough to result in an improved level of service.*

Near the stations, there will be increases in localized traffic to and from the stations. The increases in localized traffic would largely be driven by the amount of park-and-ride and Kiss & Ride traffic programmed for a particular station area. Chapter 6 of the Final EIS includes a discussion of the localized traffic effects and proposed mitigation measures.

Clarification Regarding LOS Improvements

Public Comment: You show several intersections at levels of service (LOS) of D, E, and F in 2025 and then you show improvements leading to better LOS rating (C,D). But these improvements are not due to transit alternatives, but widening the roads and intersections, no? (0112, 0382-L –22)

***Response**: The input to the travel demand forecast model includes the planned future roadway network. Therefore, the intersection levels of service for the No-Build and two Build Alternatives of the Final EIS reflect the roadway improvements of the year of forecast.*

The Project Team agrees that the Dulles Corridor Rapid Transit Project would not resolve traffic gridlock; however, it would provide an alternative to driving the automobile, which in turn would help to improve air quality in the corridor. For the purposes of this project, mitigation measures were proposed for those intersections that would have unacceptable levels of service (LOS E or F) and delay times five or more seconds or five percent greater than those experienced for the No-Build Alternative. In some cases, the failing levels of service at intersections could not be resolved by retiming or adding a traffic signal, therefore, turning lanes or extra travel lanes may be needed.

Traffic Calming Devices

Public Comment: Traffic mitigation features, such as speed bumps, additional stop signs, signs prohibiting cut-through traffic, and increased enforcement. These should be based on the anticipated future volume of traffic and should be put into place before the new rail facility is opened [Westhampton]. (0386, 0386-E –11) (0398, 0398-L –11) (0399, 0399-L –11) (0403, 0403-L –10) (0412, 0412-L –11) (0415, 0415-L –11)(0416, 0416-L –11) (0430, 0430-E –11) (0431, 0431-E –11) (0465, 0465-L –11) (0470, 0470-L –11) (0473, 0473-L –11)(0474, 0474-L –11)

***Response**: It is not the responsibility of the Dulles Corridor Rapid Transit Project to mitigate existing roadway and traffic issues, such as cut-through traffic in the Westhampton neighborhood. Since the project would not be increasing vehicle traffic within the station area, speed bumps an/or additional signage would not be warranted by this Project.*

Improvements to Haycock Road

Public Comment: Improvements on Haycock road, such as adding a lane to accommodate traffic turning at the Great Falls intersection and synchronizing traffic lights to alleviate congestion. (0386, 0386-E –12) (0398, 0398-L –12)(0399, 0399-L –12)(0403, 0403-L –11)(0412, 0412-L –12)(0415, 0415-L –12)(0416, 0416-L –12)(0430, 0430-E –12)(0431, 0431-E –12)(0465, 0465-L –12)(0470, 0470-L –12)(0473, 0473-L –12)(0474, 0474-L –12)

> ***Response****: Based on the analysis provided in Chapter 6 of the Final EIS mitigation would not be warranted at the Haycock Road/Great Falls Street intersection for two Build Alternatives. Since this intersection fails under the No-Build Alternative, mitigation was not recommended for the Build Alternatives, although the Project Team did coordinate with the City of Falls Church on this issue. For the traffic analysis, the Project Team used the Synchro software package, which optimizes consecutive traffic signals as a unit so that they all run on the same cycle. The traffic signals that were optimized/synchronized for the traffic analysis include the Great Falls Street/Haycock Road, Haycock Road/West Falls Church Metrorail Station entrance, and Haycock Road/Route 7 intersections.*

Public Comment: With respect to air pollution, the increase in bus traffic to the WFC station and the increase in automobile traffic to the new WFC multi-level parking garage will bring additional vehicular pollution in and around the WFC Metro Station which is only one-half mile from the Westhampton neighborhood. We believe that mitigation measures to improve the traffic flow on Haycock Avenue are necessary to prevent a worsening of current rush hour traffic jams in the area and a significant increase in air pollution from idling engines as people attempt to negotiate the Haycock bottleneck at Turner St. We request that the plans for the Dulles Corridor rail system include mitigation measures for peak travel flow on Haycock Road. This should include all feasible mitigation, including synchronization of traffic lights and widening Haycock Road. (0388, 0388- L-2)

Public Comment: What you do say in the EIS is that one of our neighborhood intersections, Haycock Road and Great Falls Street, will degrade to an F level of service during morning and evening hours. What I couldn't find was any suggestion of what might be done about this impact. Nor did it appear to me that you had appropriately assessed the traffic that will result in the West Falls Church area from the expansion of service. (0145, 0145-T –11)

Public Comment: The EIS does not appear to consider full impact to the Haycock Road and Great Falls Street that will degrade to an F service of level during morning and evening peak hours. There appears to be no suggestion of remedies to correct this situation, only that this project will exacerbate a poor situation. (0179, 0179-T –8)

> ***Response****: Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.*
>
> *Based on the analysis provided in Chapter 6 of the Final EIS mitigation would not be warranted at the Haycock Road/Great Falls Street intersection for the two Build Alternatives. Since this intersection fails under the No-Build Alternative, mitigation was not recommended.*

Cut Through Traffic Near West Falls Church Station

Public Comment: Also, we currently suffer from "cut-through" traffic on our narrow streets, which have no curbs, no gutters, and no sidewalks. That situation will only get worse as traffic increases into the West Falls Church metro with the addition of a 2,000 car parking garage. (0403, 0404- L- 2)

Public Comment: In addition, the traffic congestion on Haycock Rd. has already produced cut-through traffic in the Westhampton Neighborhood, as cars attempt to avoid the light at Haycock Road and Great Falls St. This is a danger to residents of the Westhampton neighborhood. We believe that the mitigation strategies in the plans for the Dulles Corridor Project should include measures such as speed bumps on Grayson Place and signs forbidding cut-through traffic in the Westhampton neighborhood. This should be coupled with increased traffic enforcement by Fairfax County. Such measures would help reduce mobile source air pollution impacts on the health of residents in the neighborhood and improve compliance with the provisions of the federal Clean Air Act. (0388, 0388- L-3)

> ***Response****: Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level. Nevertheless, the Project Team does not anticipate any increases in project-related cut-through traffic in the neighborhoods around West Falls Church Station.*
>
> *It is not the responsibility of the Dulles Corridor Rapid Transit Project to mitigate existing roadway/traffic issues, such as cut-through traffic on Grayson Place. Since the project would not be increasing vehicle traffic within the station area, speed bumps an/or additional signage would not be required as mitigation measures of this Project.*

Public Safety Impacts

Public Comment: I am unconvinced about the effectiveness of existing plans for abating noise, traffic congestion, automobile pollution and visual pollution that will impact my neighborhood. I am especially concerned about public safety, as increased traffic will lead to a greater likelihood of auto accidents near my home. It will also increase the presence of non-residents in the neighborhood, which will reduce privacy and could increase crime. (0425, 0425-E –2)

> ***Response****: Project related impacts to neighborhoods around West Falls Church Station are considered minimal and do not warrant mitigation.*

Traffic Impacts Near the Rotonda

Public Comment: The projected traffic levels of service (LOS) in the vicinity of the Rotonda (International Drive and Westpark Drive or Greensboro Drive) remain at E or F for all Metrorail alternatives; thus T4 is of no real benefit with regard to traffic congestion in this area. (0429, 0429-E –3)

> ***Response***: *The Project Team recommended and the decision-makers selected the Metrorail Extension with Alignment T6 in Tysons Corner as the Locally Preferred Alternative. Alignments T1, T4 and T9 were eliminated from further consideration after the public and agency review and comment on the Draft EIS. The Project Team agrees that the Dulles Corridor Rapid Transit Project would not resolve traffic gridlock; however, it would provide an alternative to driving the automobile. The traffic analysis in support of the Final EIS shows that traffic impacts resulting from the Build alternatives are minimal because substantial park-and-ride capacity is not provided at the four Tysons Corner stations.*

Westpark/Greensboro Drive Improvements

Public Comment: The suggested lane configurations at Westpark Drive and Greensboro Drive are very good--I only wish they could be implemented today, without Metrorail! (0429, 0429-E –7)

> ***Response****: The construction of the proposed interchanges along the Route 7 and Route 123 are not part of the Project and are not yet part of the region's Constrained Long Range Plan.*

Congestion Reduction

Public Comment: Many of us want to believe that rail will resolve gridlock, and improve our air quality. One consistent finding was that a rail system does not reduce traffic congestion, and I guess I really didn't have to spend a lot of time going through these documents and to other resources, because all we need to do is to drive along Route 66 or I-27 and we can see congestion. (0147, 0147-T –1)

Public Comment: How long will it be before the congestion would be excessive again? The Vienna metro station was proposed as a means of reducing congestion, but we have congestion again. (0166, 0166-T –4)

Public Comment: Rail will just attract its own compensating recongestion. It's clear the idea is for rail to carry more people. Voila. No wonder the study said it didn't expect rail to reduce congestion. (0155, 0155-T –4)

> ***Response:*** *The Project Team agrees that the Dulles Corridor Rapid Transit Project would not resolve traffic gridlock; however, it would provide an alternative to driving the automobile, which in turn would help to improve air quality in the corridor. As outlined in Chapter 6 of the Final EIS, the Metrorail Alternative would substantially increase the transit capacity of the corridor (i.e., the number of travelers that can be comfortably accommodated in the corridor during peak travel times), relative to the No-Build Alternative. In theory, every "new rider" generated by this project would result in one less automobile on the Dulles Toll Road or other regional roadways.*

Public Comment: Rail transit's inability to reduce congestion is generally attributed to several factors: Rail transit's share of total trips is too small to even have a significant impact on automobile use. The average transit usage by commuters in the United States is between 2 and 3 percent. (0147, 0147-T –2)

> ***Response:*** *Chapter 6 of the Final EIS outlines mode share by sections of the Dulles Corridor (Tysons Corner, Reston, Herndon/Dulles, and Loudoun East). In Tysons Corner, the highest Metrorail mode share will be approximately 34 percent; In Reston the highest Metrorail mode share will be approximately 17 percent; in Herndon it will be approximately 16 percent; and in Loudoun East it will be approximately 11 percent*

Public Comment: We are also concerned about the adequacy of the recommended mitigation measures that we suggest should result at least in no more congestion than no-build alternative. (0233, 0426-M –8)

> ***Response***: *Mitigation measures were proposed for those intersections that would have unacceptable levels of service (LOS E or F) and delay times five or more seconds or five percent greater than those experienced for the No-Build Alternative [confirm]. These mitigation measures would reduce delay at most intersections to the levels forecast for the baseline condition.*

Internal Circulation Issues in Reston and Tysons Corner

Public Comment: Both Tysons Corner and Reston have serious internal circulation issues that, if properly dealt with in conjunction with the proposed rapid transit, could become models for an integrated transportation system. Both of these areas need the ability of its commercial and residential populations to move in and around their respective areas with greater facility and flexibility. (0148, 0148-T –3)

> ***Response:*** *With the Metrorail Extension, feeder bus service would be provided from all of the proposed Metrorail stations in Tysons Corner and Reston. The majority of these stations would be constructed to include feeder bus bays onsite; however, for Tysons Central 123 and Tysons Central 7 Stations, feeder bus bays will be located on-street. Please see the Transit Operations and Maintenance Plan for a more detailed discussion of future feeder bus service in the corridor. In addition, the increased densities that are allowed in the Tysons Corner and Reston station*

areas will promote better accessibility and circulation on the ground level. The compact development will encourage walk and bike access to and from the stations.

Density of Development and Traffic Impacts

Public Comment: While it is true that BRT/rail will take some of the current cars off the roads, one of the previous studies pointed out that only 1 in 10 of any new workers to the area will actually ride rail. Roads in these areas are already at or near a grade of F. Adding all of the cars resulting from the increased density will only exacerbate the situation. (0203, 0203-L –3)

Public Comment: Specifically, what is the number of automobiles that will be added to the present streets within at least two miles surrounding these stations as the results of - Operation of the rail WITHOUT is added density provided under the most recent changes in the Fairfax County Comprehensive Plan. What type of highway construction (i.e. lane-miles) is needed handle this increased traffic and maintain a C level of service? Operation of the rail WITH the added density (commercial and residential) provided under the most recent changes in the Fairfax County Comprehensive Plan. What type of highway construction (i.e., lane-miles) is needed handle this increased traffic and maintain a C level of service. (0454, 0454-E –4)

***Response**: Table 6.1-5 in Chapter 6 of the Final EIS shows the anticipated mode shares in different portions of the Dulles Corridor for the two Build Alternatives. While the table shows that Build Alternatives experiences an increase in mode share relative to the No-Build the data in the table also shows that the majority of Home-Based Work Trips will not be made by transit.*

The increase in demand associated with density bonuses will result in localized traffic congestion in the transit station areas. As stated, the counties' development permitting process would mitigate the impacts due to increased densities within the corridor. Fairfax County has adopted non-degradation policies that will limit development that would result in traffic congestion, thus reducing the level of development and limiting any negative impacts on property values due to congestion. In addition, an evaluation of property values along other transit corridors in the Washington metropolitan area does not indicate any decrease in property values, even in areas experiencing congested conditions. Actual implementation of transit-oriented development and the timing and increase in densities is under the jurisdiction of the local government in the area, so any mitigation needed to support the increase in densities is also under the jurisdiction of local governments, and they have included such measures in their land use regulations.

Additional Traffic Analysis Needed

Public Comment: Please be assured that we are not against designing a transit project that will release gridlock. We just don't believe that the analysis before us today is complete. I believe that the EIS has not adequately studied the importance or the impact of the increased traffic volume on the neighborhood streets. So, therefore, it is my recommendation that the EIS study analysis go out beyond the intersections. (0147, 0177-T–6)

***Response:** The intersections included in the traffic analysis for the Project were selected based on their location to the planned station facilities at Wiehle Avenue, Reston Parkway, and Herndon-Monroe. At least five, but sometimes seven, major intersections were analyzed. These intersections were selected based on their location to the station, observed traffic circulation patterns, and because they would be most likely to experience the greatest project-related impact. Based on the results of the analysis, it can be inferred that the intersections adjacent to those under study would also receive the same impact since they are located in close proximity to each other. In addition, those intersections that are located further away from the proposed stations would be less likely to experience any project-related impacts. Because some of the intersections in the vicinity of stations would operate at unacceptable levels of service in 2025 with this Project, mitigation measures have been proposed as documented in the Final EIS.*

Prefer Metrorail Service

Public Comment: We support continued efforts to complete the project, and we prefer that it be a rail only project from the start. It is clear that rail will attract the greatest number of people from their cars, and that should be the overriding criteria, to reduce vehicle miles traveled. In fact, we do not see that sort of analysis in the report and it should be included. Doing so will demonstrate the value of the project to the region. BRT does not serve Tyson's corner, and this is an area that is most in need of transportation alternatives in the immediate short term - BRT won't relieve heavy traffic congestion in Tyson's. (0158, 0475-L –1)

Public Comment: In fact, we do not see that sort of analysis [VMT] in the report, and it should be included. Doing so will demonstrate the value of the project to the region. (0158, 0158-T –2)

> ***Response****: Vehicle Miles Traveled (under the No-Build, BRT, and Metrorail alternatives) were contained in Appendix II of the Travel Demand Forecasting Methodology and Results in support of the Draft EIS. The data in the appendix showed that there is a decrease in regional VMT under the BRT and Metrorail Alternatives, compared to the No-Build Alternative. This pattern would continue based on analysis conducted in support of the Final EIS.*

Concern About Assumptions for Traffic Analysis

Public Comment: Another problem is how WMATA and VDRPT invented traffic analysis zones instead of using zones entirely provided by Fairfax County. There were no such zones for Loudoun. Another falsity that led to inflated ridership estimates is the assumed speeds of Metro trains and buses. (0112, 0462-L –4)

> ***Response****: The traffic analysis zones used in the travel demand forecasts for the Final EIS are taken from the Metropolitan Washington Council of Governments' Transportation Analysis Zones (TAZ) structure that is part of the COG's regional travel forecasting model set. By federal regulation, this TAZ structure must be used to ensure an accurate comparison of transportation projects. The Project Team and Fairfax County worked together to split large zones in Tysons Corner and more accurately distribute population and employment among the smaller zones. However, the smaller zones remained within the overall boundaries of the larger zone and the overall population and employment data for the larger zone did not change, but rather was simply distributed among the smaller TAZs.*
>
> *The speeds for both Metrorail and BRT were developed using a detailed simulation package that took into account station dwell times, number and radius of curves, allowable train speeds, vehicle acceleration times, number of stations, and distance between stations. The inputs into the model reflected WMATA experience from existing operations and WMATA vehicle characteristics.*

Consideration of HOV Restrictions and I-66 and Dulles Connector

Public Comment: Page 6-3, Table 6.1-2: Peak Hour Volumes and LOS on Selected Highway Links, 2000 to 2025 for Baseline Alternative appear to fail to take into account peak-direction HOV restrictions on I-66 between the Dulles Connector and Route 29 (assume this is Interchange 69 north of Falls Church), and on the Dulles Connector itself, since LOS-F is predicted, something contrary to generally-accepted HOV operating policy. (0112, 0462-L –40)

> ***Response***: *A separate analysis was conducted for the HOV facilities on the Dulles Toll Road and the future I-495 HOV lanes because these are separated from the regular travel lanes, and would therefore be counted as separate volumes. For I-66, since it is a restricted facility during the peak period, there would not be separate volumes for HOV lanes vs. regular travel lanes; therefore, the HOV restrictions were accounted for in this table of the Draft EIS.*

Concerns About Model Version Used for Analysis

Public Comment: I saw your discussion on why you used the Northern Virginia Major Investment Study Model, but not COG Version 2. But why didn't you use the Version 1 model, which was used for the Corridor Cities Transitway study and other rail and highway studies? It's the official MPO model and is widely used for all transportation projects? (0112, 0382-L –10)

Public Comment: Which modeling techniques were employed to devise ridership estimates? Was the COG TPB Version 2 model used, or did WMATA use the Dulles Rail model or some other model? Please advise. (0112, 0112-E –4)

Public Comment: The modeling technique used to forecast ridership was the Northern Virginia Major Investment Study (NVMISM) model. This is also commonly called "the Dulles rail model," which in itself shows bias toward heavy rail over BRT. While the DEIS gives a detailed explanation why it used this methodology, believe that WMATA's reasons for using NVMISM do not provide acceptable rationale for deviating from the regionally approved travel demand forecasting model, known as Version 1 or 2 National Capital Region Transportation Planning Board at the Metropolitan Washington Council of Governments (COG TPB for short). While MDOT and other DEIS endeavors have used COG's Version I. Version I was not even considered for the Dulles project, though Version 2 was tested against NVMISM. WMATA and VDRPT must explain why Version I was not used, though that is the official technique of the COG TPB, which is the metropolitan planning organization (MPO) for the greater D.C. area. DEIS Technical report on methodology and forecasting (page 22) states: "NVMISM was developed initially for the 1994 Dulles Corridor Rail Study…" have been advised that NVMISM was invented by Parsons Brinkerhoff and was "refined" by Jeff Bruggeman of AECOM for the I-66 study. However, the main purpose of this model was for building a case for Dulles Rail - not BRT. It would appear that WMATA did more "refinements" with the Dulles model to build a case for rail. (0112, 0462-L –12)

> ***Response****: The Project's ridership estimates were developed using the Northern Virginia Major Investment Study Model (NVMISM). This model was developed for the original Dulles Corridor Major Investment Study and was also utilized for the Metrorail I-66 to Centreville Major Investment Study. This model set was utilized instead of the COG Version 2 model because Version 2 had not yet been validated. A more detailed description of the selection of the model was outlined in Chapter 3 of the Travel Demand Forecasting Methodology and Results Technical Report (June 2002).*
>
> *The NVMISM model was not a replacement of the Version 1 Model but rather an adaptation and refinement of the model for more localized analysis. This approach was used because the Version 1 model is region wide and was meant to describe regional travel flows. The NVMISM model refined this model in terms of a more detailed highway and transit network, smaller transit analysis zones that more closely reflect the differences in land use, and the incorporation of BRT into the model. In addition, the Version 1, because it was a regional model, did not estimate mode of arrival accurately at a station area level, thus making it difficult to plan for park-and-ride capacity and other station area improvements.*

Credibility of Model Results

Public Comment: I understand the NVMISM model cannot be calibrated due to the "deep nesting" method it relies on to determine trip generation. Why did you use it then? (0112, 0382-L –11)

Public Comment: NVMISM was the same model that predicted 115,000 Dulles rail trips from the earlier Dulles Rail study. That number did not even pass the laugh test, though rail transit advocates have given it a life of its own! This number persists in being spread around the Internet on various Web sites, such as: http://www.libertynet.org/netis/ridership_comparison.htm. (0112, 0462-L –13)

> ***Response***: *The NVMISM model was used because the Project Team determined that it provided the best tool available at start of the environmental review process in year 2000. The MWCOG*

models at the time had poor transit modeling capabilities and could not be used to address many of the issues which were of importance to the study, including the trade-off between BRT and Metrorail, detailed station choice and alignment issues in Tysons, mode of access at suburban stations, and park-and-ride capacity restraint.

Bias Against BRT

Public Comment: The bias against BRT in using this model is noted on page 72 of the technical report, where you state: "NVMISM, as with most regional travel demand forecasting tools, was not originally equipped to deal with the mode of Bus Rapid Transit." You add that "it was clear that as scoped by project stakeholders, BRT could not be considered as an express bus system…rather was assumed that BRT was a hybrid system, which at last for travel demand analysis, should generate a demand somewhere between an express bus system and rail system." This statement shows an inherent bias and fundamental flaw with this DEIS. Indeed, most of the "stakeholders" during scoping were advocates of fixed rail over bus service. Examining the scoping reports, one would conclude that most of the "stakeholders" were environmental activists and proponents of high-density development. Few impacted communities were considered in terms of new density to attract rail ridership, nor commuters who would have to pay high tolls to fund fixed rail. It also is untrue that "most regional travel demand forecasting tools" cannot "deal" with BRT. (0112, 0462-L –14)

Public Comment: In addition, NVMISM has a bias against BRT because it factors in "potential traveler's perception of ride comfort, convenience, safety, security, the availability or lack of a seat, system image and reliability" (See page 72). These are all subjective and are not proper measures of effectiveness for a transportation study. (0112, 0462-L –17)

Response: *The travel demand forecast model was not biased against BRT. The referenced statement from the Draft EIS Technical Report indicated that the characteristics of BRT were not part of the existing model set because it had not been a mode that had been modeled in the Washington area, and therefore the characteristics of this new mode had to be incorporated into the model. The demand for, and perception of, different modes of service was based on experience with transit systems throughout the United States as well as a large number of attitudinal surveys of transit riders from all over the United States. This was what was referred to in the statement "it was assumed BRT was a hybrid system, which at least for travel demand analysis, should generate a demand somewhere between and express bus system and Metrorail system. The scoping process was a public process open to all members of the public and therefore was open to both advocates of Metrorail, BRT, and existing bus services. The statement that most regional travel demand forecasting tools could not deal with BRT meant simply that a mode with the unique characteristics of BRT had to be incorporated into the model set.*

Rider perception of different modes is an extremely important and common part of modeling mode choice. Countless attitudinal surveys have been completed that show that people prefer certain transit modes relative to others. The factors playing a role in this perception were outlined in the Travel Demand Forecasting and Methodology and Results Technical Report (June 2002). Use of these 'bias factors' is standard practice in demand forecasting.

Confidence Interval of Model Forecasts

Public Comment: What is the +/- (confidence interval) around these [NVMISM] forecasts? What's the uncertainty? (0112, 0382-L –12)

Response: *The development of a regional travel model does not lend itself to a statistical estimation of error terms. The model is developed to match base year information at the greatest level of detail possible. Thus, the forecasts are made so as to predict the "most likely" outcome and to be used to assess the differences between alternatives in order to make "better" choices from the available data.*

Use of 1990 Census Data

Public Comment: Another fault in your study is reliance on 1990 census data. You state in the same report on page 61 that the reason you used 1990 census data was because "data from MWCOG's most recent travel surveys (1994) were not available at the time the model was developed." However, the 1997 U.S. Census provided updated journey-to-work data and other information that should have been factored into your studies. Why this was not done remains a mystery, especially when you made "refinements" to the Dulles rail model while the EIS was being done. It also appears you used the COG Patronage Study (conducted for WMATA) to derive baseline numbers (See "Travel Demand Forecasting Methodology and Results - Appendix I). I believe the 1997 census data was available in 1999 and should have been used. (0112, 0462-L –15)

> ***Response****: The 1990 data referenced was not census data but rather the MWCOG travel survey, which surveys travel preferences and origins/destinations for use as inputs into the regional model sets. With regard to the journey-to-work data, this is data that MWCOG must incorporate into its data sets. The Project Team did not have the resources to incorporate this data and thus relied on MWCOG. More current data was not available from MWCOG at the time the Draft EIS was prepared. The forecasts used for the Final EIS used 2000 Census data as an input.*

Use of Composite Impedance

Public Comment: Another major fault with model is reliance on "composite impedance" where you look at time and costs to go from Points A to B for every mode. This is probably why your travel times from station-to-station are extremely fast (see discussion of speeds). Understand that "composite impedance" is not used in other travel demand forecasting. (0112, 0462-L –16)

> ***Response****: The concept of impedance is the foundation of modeling, and is used in both the trip distribution and mode choice steps of the modeling process. Composite impedance is simply the combination of two key factors in distribution and mode choice, travel time and cost. Travel time is an input into the composite impedance, and thus has nothing to do with the calculation of travel times. The station-to-station travel times utilized in the model were developed using a detailed simulation package that takes into account station dwell times, number and radius of curves, allowable train speeds, vehicle acceleration times, number of stations, and distance between stations. Composite impedance is quite a common approach in travel forecasting for estimating trip distribution and mode choice.*

Traffic Analysis Zones Used

Public Comment: And, another problem are the fact your "traffic analysis zones," which appear to be a key ingredient in factoring ridership, were "recreated," as stated on page 61 of the "Methodology" technical report (See Exhibit 1). While you rely on Fairfax County subzones, you also state: "Since the number of subzones allocated to Fairfax County was less than the 62 additional zones required, zone numbers from ranges set aside for other Northern Virginia counties were used to make up the complete set. Zonal boundary files were recreated, zonal areas were calculated and various land use and related model inputs, such as densities, were updated for each year used in the analysis…"Again, this seems to be a potentially fatal flaw in your methodology because you are inventing TAZs to inflating land use densities in order to inflate ridership potential for rail, but not BRT. Plus, you state on page 380 of the "Traffic Analysis and Station Access Study" technical report, that you did not even have such TAZs for Loudoun County. Yet, you "assume" that "travel patterns in the county would still be affected by transit-related growth in Fairfax County." This could be a false assumption. (0112, 0462-L –18)

> ***Response****: Transportation Analysis Zones (TAZs)were not recreated. The existing TAZs in Tyson Corner and Reston/Herndon are quite large. There is significant variation in land uses and employment and residential densities within Tysons Corner and Reston, and these same*

variations occur within the large TAZs in the area. The purpose of splitting zones was to allow for more detailed analysis and to more finely reflect land use and densities. An example of why this was done was that under the current TAZ structure, a single large TAZ might include large office concentrations along Route 7 in Tysons as well as low density uses such as an auto dealer. The result of all of these different uses in a large TAZ is that these uses are 'averaged' over the TAZ, thus providing an inaccurate description of what is really there as well as what the demand for travel to and from the TAZ really is. To allow for more detailed analysis, large TAZs were split so that the different uses would each be reflected. No changes to the original TAZ boundaries occurred. Instead existing TAZs were split. Further, no changes in the population and employment data in the TAZ was altered. Instead, the data was distributed among the split zones to more accurately reflect the land uses in the split zones. The Technical Report prepared in support of the Draft EIS stated that the MWCOG model has extra zone numbers that are not assigned to a current zone. This is because this sort of split zone analysis is a common technique when doing detailed sub-area analysis. The Technical Report simply states that these extra numbers were assigned to the new subzone structure for Tysons Corner and further states that some numbers from the extra numbers assigned to Loudoun County also had to be used.

The reference to the Traffic Analysis and Station Access Technical Report (June 2002) refers to the analysis of increased land use densities around transit stations allowed under Fairfax County's Comprehensive Plan. Analysis was completed for Reston/Herndon and Tysons Corner in Fairfax County to determine secondary impacts from the allowable increase in densities (completed for the Draft EIS but not re-assessed for the Final EIS) However, the travel demand forecasts in the Final EIS are based on the Metropolitan Washington Council of Governments' Round 6.3 Cooperative Land Use Forecasts. The Round 6.3 forecasts represent the regionally adopted population and employment forecasts through 2025, for the metropolitan Washington area, including Fairfax and Loudoun County. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS. As noted, the Project Team did calculate ridership based on density bonuses in the Tysons Corner and Reston/Herndon areas for the purpose of assessing secondary traffic impacts in support of the Draft EIS, but these demand figures were not included in the Final EIS.

Concerns About Model Consistency With COG TPB

Public Comment: Lastly, if your ridership forecasts are not in line with what the COG TPB derives, how can WMATA and VDRPT expect to receive federal funding for this project and include it in the TPB Constrained Long Range Plan (CLRP) when the official MPO model was not even considered or run in your contest (Version I)? In order to get federal funds, a project must be part of the regional CLRP and meet the Air Quality Conformity Determination of the regional Transportation Improvement Program. What are DRPT and WMATA going to do if patronage forecasts for Dulles Rail conducted as part of the regional transportation planning and air quality conformity efforts result in lower or much lower ridership projections? (0112, 0462-L –19)

Public Comment: Hence, reliance on the Dulles rail model is risky. But another problem with this model is the lack of public involvement in its preparation. In contrast, COG Versions 1 and 2 are being scrutinized in public. In fact, they have been under attack from environmental groups for years and some TPB members. COG TPB has approved subjecting Version 2 to peer review. Version 1, at least, has undergone public scrutiny. In contract, the Dulles Rail/NVMISM model has never, to my knowledge, been peer reviewed, calibrated, validated or used in other DEIS endeavors, except the I-66 Multimodal study where it was substantially revamped. The Dulles rail model should be discarded and never again be used for forecasting work in Northern Virginia or anywhere else. (0112, 0462-L –20)

***Response**: The NVMISM model used for ridership estimation was an adaptation and refinement of the Version 1 Model, not a replacement. This approach was used because the Version 1 model was region wide and was meant to describe regional travel flows. The NVMISM model refined this model in terms of a more detailed highway and transit network, smaller transit analysis zones that more closely reflect the differences in land use, and the incorporation of BRT into the model.*

In addition, the Version 1 model did not estimate mode of arrival accurately at a station area level, thus making it difficult to plan for park-and-ride capacity and other station area improvements. The Travel Demand Forecasting Methodology and Results Technical Report (June 2002) was a public document and therefore this comprehensive description of the modeling process was available for detailed scrutiny. The NVMISM model has been used twice before and the adaptations to the model between uses have been publicly documented.

Modal Split for Metrorail and BRT

Public Comment: That modal split for rail to Dulles Airport is only one percentage point higher than BRT. (0446, 0218-M –9)

Public Comment: That modal split for rail to Dulles in 2025 is only one percentage point lower - I'm sorry, higher than BRT. (0446, 0146-T –9)

Response*: The Draft EIS outlined mode share by sections of the Dulles Corridor (Tysons Corner, Reston, Herndon/Dulles, and Loudoun East). In Tysons Corner, the difference in mode split between BRT and Metrorail ranges from 6.1 to 6.6 percent (with Metrorail having the higher mode share). In Reston, the difference ranges from 1.9 to 3.3 percent. In Herndon/Dulles, the difference ranges from 1.2 to 3.0 percent and in Loudoun East, the differences range from 0.1 to 0.3 percent.*

Difference Between New Trips and New Riders

Public Comment: That the terms "new trips" and "new riders" are used interchangeable, when in fact new riders refer not to new individuals using a facility, but new trips. Under the existing definition, a new transit rider traveling to work and back is counted as two new riders. (0446, 0146-T –7), (0446, 0218-M –7)

Response: *Table 6.3-9 of the Draft EIS did use the terms new riders and new trips interchangeably. The 'New Riders' column in the table did not refer to a new person or individual using transit (a person would presumably make two trips per day) because of implementation of the BRT or Metrorail Alternative. Rather the column refers to the additional trips beginning or ending in the Dulles Corridor over and above the trips of the No-Build Alternative.*

Model Version, Calibrations, and Confidence Interval

Public Comment: Consultants working for DRPT and WMATA should be instructed to redo the entire travel demand forecasting analysis using the current COG/TPB Version II models set, or at least generate some ridership projection based on Version 1, which is the official MPO model. Why it was not even considered for this DEIS needs to be explained in detail. This analysis should include a new set of express bus routes connecting neighborhoods in the Dulles Corridor with "downtown" areas of Arlington County and the District of Columbia - fashioned after the original bus-on-freeway concept used in the Shirley Highway Corridor (but without buses from American Motors). There should be extensive documentation of the original Shirley Express bus service available in the archives of VDRPT or the U.S. Department of Transportation. When complete, the results (all of the results) should be released to the public without charge via the World-Wide Web. Other questions that must be answered are:

1. Has the NVMISM/Dulles rail model been calibrated? I understand it cannot be due to the "deep nesting" method it relies on to determine trip generation. Is that so?
2. What is the +/- (confidence interval) around these forecasts? What's the uncertainty? (0112, 0462-L –21)

Response*: The NVMISM model used for ridership estimation was an adaptation and refinement of the Version 1 Model, not a replacement. This approach was used because the Version 1 model was region wide and was meant to describe regional travel flows. The NVMISM model refined this model in terms of a more detailed highway and transit network, smaller transit analysis zones*

that more closely reflect the differences in land use, and the incorporation of BRT into the model. In addition, the Version 1 model did not estimate mode of arrival accurately at a station area level, thus making it difficult to plan for parking capacity and other station area improvements.

Other than certain Loudoun County routes, express routes from the Dulles Corridor to the downtown areas of Arlington and the District of Columbia are not part of the Build Alternatives of the Final EIS, and therefore were not be modeled. The model was calibrated as well as possible given the level of data available at the time of its development (1996). A lack of adequate travel data has been a problem for the Washington area and has plagued all model development efforts for at least 30 years, including the most recent MWCOG Version 2 efforts. The level of data was not sufficient then (nor is it now) for a full, detailed statistical calibration of all components. In lieu of the availability of detailed travel data, travel behavior was stratified in logical patterns, ridership "targets" for each strata were assembled from a variety of sources, service elasticities were set based on national practices, and market-specific constants to represent the "other" factors in travel choice were estimated to match the ridership targets. This is the state of the practice throughout the country

The development of a regional travel model does not lend itself to a statistical estimation of error terms. The model is developed to match base year information at the greatest level of detail possible. Thus, the forecasts are made so as to predict the "most likely" outcome and to be used to assess the differences between alternatives in order to make "better" choices from the available data. Also, the structure of the modal choice model, which is usually the source of most of the comments concerning statistical validity, is actually only a relatively small part of the overall uncertainty in the process. Items which are likely to create at least as much uncertainty include the projection of population and employment in total magnitude and distribution by small area; changes in travel behavior due to socioeconomic trends such as labor force participation rates by women; impacts of technology such as telecommuting; actual changes in the transit "competition"(i.e., the construction of highway facilities); and the true costs of travel due to fuel prices, fuel efficiencies, technology trends, transit operating efficiencies.

Overly Optimistic Ridership Estimates for Metrorail

Public Comment: The DEIS projects overly optimistic ridership estimates for rail (as high as 73,000 when factoring in high-density development near proposed stations), and low balls BRT, largely because it fails to provide stops in Tysons Corner - a major jobs destination and activities center. The methodology used to project these inflated ridership estimates for rail was the "Northern Virginia Major Investment Study Model" (NVMISM). WMATA and VDRPT chose to base their study on this model instead of the approved modeling techniques of the National Capital Region Transportation Planning Board (TPB), known as Versions 1 and 2. The NVMISM model was based on "the Dulles rail model," developed in the early 1990s primarily to build a case for rail to Dulles Airport. This model has never been discussed in public and was never accepted for use by the TPB, which is the official metropolitan planning organization (MPO) for the Greater D.C. area, including Fairfax and Loudoun counties. (0112, 0462-L –3)

***Response**: In the Dulles Corridor Transportation Study (June 1997) and in initial analysis of alternatives in the Draft EIS, bringing BRT into Tysons Corner and developing additional stations in the area was examined. Based on the goals of BRT, specifically rapid trip times and a 'rail like experience' it was determined that running BRT vehicles on local congested streets within Tysons Corner would detract from the goals for BRT. For this reason it was determined that a single station served from the Dulles International Airport Access Highway was the most appropriate BRT alignment.*

The NVMISM model used for ridership estimation was an adaptation and refinement of the Version 1 Model. This approach was used because the Version 1 model was region wide and was meant to describe regional travel flows. The NVMISM model refined this model in terms of a more detailed highway and transit network, smaller transit analysis zones that more closely reflect

the differences in land use, and the incorporation of BRT into the model. In addition, the Version 1 model did not estimate mode of arrival accurately at a station area level, thus making it difficult to plan for parking capacity and other station area improvements.

Version of Regional Travel Demand Model Used for the Analysis

Public Comment: The project team continues to use the Northern Virginia Major Investment Study (NVMISM) "Dulles Rail Black Box" model for this SDEIS rather than the current release of the COG/TPB Version 2 travel demand forecasting model, which you pledged to use in the final EIS. (0016 0122-18)

Public Comment: I did not get answers to my questions from John Dittmeier about what modeling technique he used in this round. In the supplement hearing report on the first EIS, the project team said they would use a more-credible model - the COG Version 2 model - in the final EIS. I believe that model should be used now. (0016 0122-9)

Response: *DRPT and WMATA did not commit to use the MWCOG Version 2 model in the Final EIS. When the EIS process began approximately four years ago, the decision to use the NVMSIM model was based on the fact that only an early version of the Version 2 model had been developed and was not yet available in a calibrated form. This decision is documented in the Travel Demand Forecasting Methodology and Results Technical Report (June 2002), prepared in support of the Draft EIS.*

Federal Government/MWAA Ownership of DIAAH

Public Comment: Is it necessary that the Federal Government/MWAA retain title to the Dulles Airport Access Road (DAAR)? (See Attachment B). (0427, 0427-E –10)

Public Comment: Given the traffic patterns that have emerged or been developed for access to the DIA, there is little or no justification or rationale for the Federal Government/MWAA to continue to hold title and control the DAAR. The current situation merely transfers the vehicular traffic management problem sixteen (16) miles to the east of the entrance of the DIA and then becomes a Commonwealth of Virginia responsibility. DIA entry and egress traffic then enters/exits three ways, a portion continues to I-66 and points east. The remaining traffic divides between north and south on I-495 or leaves/enters the DAAR from/to the DTR for local destinations. During high-volume traffic periods, many of the taxis, limousines, and vans go north on I-495 to the George Washington Memorial Parkway and thence into the District of Columbia rather than experience the delays on I-66 inside the Beltway (I-495). It is recommended that title to the land and control of the DAAR currently held by the Federal Government/MWAA be transferred to the Commonwealth of Virginia as a provision of the Rail-to-Dulles Project authorization/appropriation bill. This action would facilitate the design of the rail and/or BRT and other mass transit facilities, reduce expenditures for both the MWAA and the Commonwealth of Virginia, and permit the development of a well-planned and engineered Dulles Corridor mass transit/traffic management facility. To continue the existing arrangement would unnecessarily involve the MWAA and most likely, complicate the design and engineering of the Dulles Corridor mass transit facility. (0427, 0427-E –12)

Response: *The Metropolitan Washington Airport Authority (MWAA) was created by an act of Congress to manage National Airport and Dulles Airports in the Capitol Region. The Dulles International Airport Access Highway was built to ensure efficient access to Dulles Airport from Washington, D.C. and the entire region. The Dulles Toll Road was later constructed to increase mobility in Northern Virginia. MWAA as authorized by the Federal Aviation Administration controls the DIAAH to ensure continued efficient transportation to and from Dulles Airport. There are currently no plans for this Project to request a transfer of ownership of the DIAAH from MWAA and the U.S. Department of Transportation to the Commonwealth of Virginia.*

B. Supplemental Draft EIS Comments

State Agency Comments

Minimize Impacts to Roadway Operations

State Comment: "These modifications would require taking some of the I-66 right-of-way." Please ensure that these plans and agreements are well-coordinated with VDOT, so that current roadway operations and potential future improvements to I-66 are not affected. (0091 0106-19)

> ***Response:*** *DRPT and WMATA will continue to coordinate with VDOT during preliminary engineering and final design.*

Traffic Impacts at Park and Ride and Stations

State Comment: "Parking at Tysons West Station would be reduced to 500 spaces and be constructed as part of a joint development project. The specific location and design of the park-and-ride facility is not known at this time, but the anticipated cost of the facility is assumed as part of the Dulles Corridor Rapid Transit Project. Vehicles accessing the stations would use local roads." Please explain how the traffic impacts of the proposed future 500 space park-and-ride facility and station access will be addressed. (0091 0106-3)

State Comment: "The implementation of the proposed LPA, and, specifically the provision or expansion of park-and-ride and Kiss & Ride facilities, would result in increased traffic on local roadways around stations." Please indicate in the Final EIS the measures required to mitigate traffic impacts on local roadways around stations and identify which measures will be completed by the Project and which measures will not be part of the Project. (0091 0106-8)

> ***Response:*** *The traffic analysis for the Tysons West Station are presented in Chapter 6 of the Final EIS and in the Traffic Analysis Technical Report.*

State Comment: "Based on the mode of arrival data presented in Table 6.2-3, the 2025 park-and-ride person-trips that would be generated at the [Wiehle Avenue] station under the proposed LPA and proposed LPA Phase 1 are expected to change minimally compared to the Metrorail Alternative. Therefore, it can be assumed that the general traffic impacts expected in the vicinity of the station area would be similar to those documented in the Draft EIS for the Metrorail Alternative T6/Y15)." During the period when the Wiehle Avenue Station operates as the interim terminus of the LPA Phase 1, traffic patterns will differ substantially from those that can be anticipated when this station becomes an intermediate station. It can be anticipated that more riders will access the transit system at this location, since this will be the most convenient rail access option for potential riders to the west of Wiehle Avenue. (0091 0106-10)

State Comment: Since FTA is only considering funding for Phase 1 at this time, please indicate the measures the Project will take to minimize level of service degradation at the station entrance and its vicinity as a result of the Wiehle Avenue Station being the interim terminal station. For example, indicate how the Project will address the possibility of extensive queuing from the eastbound DTR ramp to northbound Wiehle Avenue in the AM and possibly the opposite movement in the PM. In the sentence "…extensive queuing thus making the westbound…," the word westbound may be incorrect. Queuing is expected on the eastbound ramp. (see above) (0091 0106-11)

State Comment: "The additional traffic entering the station via Isaac Newton Drive would have negligible effect on traffic operations." Traffic balances itself out and when the traffic is congested on the Wiehle Avenue corridor and the toll road ramps, drivers will use Sunset Hills Road. Therefore, a possible approach to balancing traffic may be to build a right turn only lane on Sunset Hills Road at the entrance to the station. (0091 0106-13)

State Comment: "Proposed mitigation strategies for traffic impacts at Wiehle Avenue include adding turn lanes at intersections, parking management techniques, preferential treatment for rideshares, financial/time incentives, and information and marketing campaigns." Adding turn lanes at intersections does not seem adequate to address the traffic impacts that will occur as a result of the interim terminal station located at Wiehle Avenue. Also, please provide background analysis as to how these proposed mitigation measures were determined, and identify roadway improvements that would fully address the traffic impacts. (0091 0106-5)

> ***Response:*** *With Wiehle Avenue as the interim end-of-line station for the Wiehle Avenue Extension, there will be more bus and Kiss & Ride activity in the morning and evening peak periods than with the station as an intermediate station. The park-and-ride traffic for the 2,300 space structure would, however, be identical to that when Wiehle Avenue Station is an intermediate station along the full 23-mile extension of Metrorail. Moreover, the park-and-ride will likely be full before the local peak hour of Reston; in other words, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m. while the local peak hour would be between 7:30 a.m. and 8:30 am. Additional analysis of traffic effects for both the Full LPA and the Wiehle Avenue Extension has been conducted in support of the Final EIS and are included in Chapter 6. Mitigation measures for anticipated effects have also been identified.*

Clarifications Regarding Proposed Traffic Mitigation

State Comment: The proposed traffic mitigation measures listed [Section 6.2.3] do not fully address the impacts on the existing transportation system. Please provide technical analyses that validate and document the completeness of this list. (0091 0106-17)

> ***Response:*** *The Project Team reanalyzed traffic effects in support of the Final EIS. The Team will provide the Traffic Analysis Technical Report to VDOT.*

State Comment: Vol II, p. 081 It is unclear whether the intersection improvements (Lengthen SB Route 7 dual left) proposed with the DEIS are still proposed with the preferred LPA. (0093 0109-9)

> ***Response:*** *Because of the reduced park-and-ride capacity of the Tysons West Station, this improvement would no longer be part of the Project. This conclusion is based on a traffic re-analysis conducted in support of the Final EIS.*

State Comment: This table [Table 2.2-2] indicates that the number of intersections at LOS F (am or pm) does not change from existing conditions, or gets worse. This information is not shown for the "LPA Phase 1 Opening Year" cell – please include. Also, please include the specific intersections (as listed in traffic mitigation section of SDEIS) and the proposed mitigation measures to address the traffic impacts at these intersections as a result of this project. (0091 0106-2)

> ***Response:*** *Chapter 6 of the Final EIS contains the requested information.*

Construction Impacts and Mitigation

State Comment: This chapter [Chapter 6] should include a commitment to develop and implement a Congestion Management Program to operate during the construction of this project, especially in the Tysons Corner and Wiehle Avenue areas. (0091 0106-20)

> ***Response:*** *Congestion management measures for incidents during and due to construction of the Metrorail Extension will be developed during preliminary engineering and final design.*

Suggested Tysons West Circulation Improvements

State Comment: Option E site plan of Tysons West Station entrance and facilities
The Project Team may want to consider a left-turn pocket at the proposed Station Entrance on westbound Tyco Road (heading toward Route 7) to accommodate left-turn movements into the station. Also, appropriate traffic studies and any other documentation must be provided to VDOT in support of the proposed signal on Tyco Road. This needs to accompany any formal request to VDOT for such signal installation. (TE) (0149 6-1)

> ***Response:*** *The Project Team will consider the recommendation of a left-turn pocket and of a signal warrant analysis during preliminary engineering.*

Local Agency Comments

Clarify Responsibilities for Transportation Improvements

Local Comment: Clarify which transportation improvements will be done as a part of the project, and which are "mitigation" that may be completed by others. (0093 0109-1)

> ***Response:*** *Chapters 2 and 6 of the Final and the final General Plans describe and depict the transportation improvements that will be developed as part of the Project. All measures proposed to mitigate anticipated effects of the Project will be implemented by DRPT.*

Clarifications Regarding Proposed Traffic Mitigation Measures

Local Comment: The traffic mitigation measures identified in the SDEIS should be programmed by the Virginia Department of Transportation at the earliest possible date so that they are constructed before the rail system begins operation. (0083 0098-3)

> ***Response:*** *The traffic analysis in support of the Final EIS process identified roadway mitigation measures for the two Build Alternatives. DRPT and VDOT will program these improvements in order to complete their construction by the opening year of the Wiehle Avenue Extension.*

Local Comment: TRANSPORTATION MITIGATION IMPROVEMENTS. Two issues should be clarified with regards to Chapter 6 - Transportation Effects, 6.2.3 Transportation Mitigation, Table 6.2.7 presented on page 6-22 and 6-23. Specifically, the table provides a summary of proposed mitigation options to include construction of an additional through lane on Northbound (NB) and Southbound (SB) approaches to the westbound (WB) Dulles Toll Road ramp at Fairfax County Parkway and construction of an eastbound (EB) right turn lane onto Herndon-Monroe Parkway/Van Buren Street intersection. According to the Table 6.2.7, these proposed mitigation measures are required by 2025. We believe that both of the measures are warranted and should be completed prior to the opening of the Herndon-Monroe Rail Station, rather than by 2025. A northbound right turn lane at Van Buren Street and Herndon Parkway is also a critical need prior to the opening of the Herndon Monroe Station. (0132 0171-5)

> ***Response:*** *The traffic analysis conducted in support of the Final EIS process identified roadway improvements proposed as mitigation measures for the two Build Alternatives as detailed in Chapter 6 of the Final EIS.*

Public Comments

Public Comment: How will construction of rail during Phase 1 affect buses and qualifying cars that seek to use the Access Road? Will they be prevented from doing so? When? Will the trip be impeded? (0068 0173-7)

Response: *Construction of the Wiehle Avenue Extension will include realignment of portions of the DIAAH and construction of one median Metrorail station and track. To complete this, there may be closures of shoulders and possibly one lane of the DIAAH during non-peak periods. If safety concerns warrant, a brief closure of one direction of the DIAAH could occur in an overnight period to transport materials and equipment if traffic conditions allow. All lanes of the DIAAH will be kept open during peak periods.*

Roadway Level of Service Analysis

Public Comment: Please project the Level of Service (A to F) along the Dulles Toll Road according to AASHTO methodology for the major interchanges from I-495 to Route 772, both for year of opening of Phase I (2009) and year of completion (2025). Do this estimate both for 1) Dulles Rail in operation, and 2) Dulles Rail not in operation. (0061 0117-2)

Public Comment: We'd like to see a level of service projections for both the toll road and the Greenway through 2025 both with and without Dulles Rail in place. (0061 0136-3)

Response: *Chapter 6 of the Final EIS presents the anticipated levels of service on the Dulles Toll Road and the Dulles Greenway.*

Access/Egress Concerns

Public Comment: Our chief concern is our exit next to your proposed exit on to Tyco Road. We must keep a second exit from our premises as required by Fairfax County Fire and Rescue for the safety of our tenants. Our other exit is primarily an entrance, due to the sight distance on Tyco Road. Your proposed exit eliminates some of our much-needed parking. Fairfax County is very strict about required parking in the Tysons area. The loss of parking spaces would mean the loss of tenants. The proposed exit traffic light causes an egress problem inasmuch as we cannot exit on green or red. These could all be eliminated by moving your proposed exit to the east, leaving our exit and parking in place, but still allowing you to exit onto Tyco Road perpendicularly but with a shorter bus stacking distance. Fewer buses will also enhance our sight distance to the east, probably required by VDOT. (0157 6-1)

Response: *These issues will be addressed during preliminary engineering, as the design and vehicular circulation of the Tysons West Station facilities are refined.*

Traffic Impact Study at East Falls Church Station is Needed

Public Comment: The East Falls Church Metro Station will be the last station on the Silver/Orange line, and will have a significant increase in service frequencies. We believe it is contradictory to assume, as the EIS does, that there will be no traffic impacts at, and around, this station.

We take this opportunity to request once again that the EIS for the Dulles Corridor Rapid Transit Project must include a traffic impact study for the area around the East Falls Church Metro Station. (0145 6-1)

Response: *Implementation of the Project would result in increased off-peak Metrorail service at the East Falls Church Station. However, operating plans for the Wiehle Avenue Extension and Full LPA assume no additional feeder bus service, nor any new park-and-ride capacity for the off-peak period for this station. Because the station's existing park-and-ride facilities are typically full by 8:00 AM on most weekdays and parking is controlled on local streets, it is not anticipated that increased off-peak Metrorail service would generate additional traffic in and around the East Falls Church Metrorail Station. Based on the analysis of the forecast ridership volumes for the East and West Falls Church Metrorail Stations, the Project Team does not feel that overflow parking onto residential streets will be a problem. Moreover, since completion of the Draft EIS analysis, WMATA has programmed a 960-space parking facility at West Falls Church to be completed in early 2005. This new facility is part of the analysis in support of the Final EIS. The Project Team*

did initiate meetings with the City of Falls Church to discuss the issues of overflow parking and cut-through traffic.

Minimize Impacts to Roadway Operations

Public Comment: t. The location of a proposed LPA Phase 1 alignment ending approximately 2000 feet west of the Wiehle Avenue Station would place it too near the exit ramp for Reston Parkway (at 2-25). The impact of that proximity needs to be evaluated in the SDEIS. (0068 0173-37)

Response: *The Metrorail alignment and station will be entirely within median of the Dulles International Airport Access Highway and will not interfere with Dulles Toll Road operations at the Reston Parkway ramps.*

Traffic Impacts at Park and Ride and Stations

Public Comment: The traffic impact of the new rail service will be further compounded by a multi-story park-and-ride structure being built at the WFC Metro station. (0026 0027-3)

Public Comment: Improving the Great Falls/Haycock intersection with turn lanes. (0087 0102-9) (0089 0104-9) (0099 0115-9) (0104 0121-7)

Public Comment: The Dulles rail public hearings report states on page 273 that traffic impacts from the WFC park-and-ride facility will be addressed by that project, and therefore, the higher traffic volume created by the park-and-ride facility is included in the Dulles rail baseline. Yet there has been no study done of traffic impact of the park-and-ride project on the neighborhood streets outside the immediate vicinity of the station or planned mitigation in the staff reports prepared by either the Fairfax County Planning Commission or the Washington Metropolitan Area Transit Authority for the park-and-ride facility. Somewhere, this traffic impact needs to be addressed by either the rail or garage project. (0026 0027-13)

Public Comment: The buck is being passed between the WFC park-and-ride and Dulles rail projects. The traffic impact on our community needs to be addressed by either the rail or the garage project and the Virginia Department of Transportation. (0099 0115-3) (0089 0104-3) (0087 0102-3)

Response: *Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church Station will return to its former level.*

For the purposes of this project, mitigation measures were suggested for those intersections that would have unacceptable levels of service (LOS E or F) and delay times five or more seconds or five percent greater than those experienced for the No-Build Alternative. Based on the analysis in support of the Final EIS, which included the new park-and-ride structure at West Falls Church Station, mitigation would not be warranted at Route 7/Haycock Road, Great Falls Street/Haycock Road or at the Haycock Road/Park-and-Ride entrance under the two Build Alternatives, as levels of service and delay times are improved or only slightly more than those for the No-Build Alternative.

Public Comment: The SDEIS fails to assess the impact of "conversion of the 830-space surface lot to a 2,000-space parking structure" at the Route 606 Station. The impact on arterial feeder roads, as well as residential neighborhoods needs to be adequately and objectively assessed. (0068 0173-14)

Response: *The traffic analysis in support of the Final EIS estimated the impacts of a 2,750-space park-and-ride facility at Route 606 Station in 2025; this represents a 2,000-space expansion of the existing facility.*

Public Comment: Highway traffic around stations will not be a major problem. After the Vienna MetroRail station opened and drew about 17,000 weekday passengers on plus off, VDOT found only five percent more traffic, less than natural growth. What traffic fears overlook is that cars that park stop generating VMT, reducing congestion at all of the intersections they no longer drive through. (0054 0090-3)

> ***Response:*** *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region were important to us while preparing the Final EIS.*

Clarifications Regarding Proposed Traffic Mitigation Measures

Public Comment: Please don't forget that Wiehle in the Lake Anne old section doesn't meet VDOT standards, and any funding should include ancillary improvements to the actual rail-depot-parking funding. (0045 0046-2)

Public Comment: Wiehle Avenue between Sunset Hills Road and Baron Cameron Avenue is built to an earlier standard, with narrower lane widths and greater vertical and horizontal curvature than is permitted today. This section of Wiehle Avenue will carry the majority of traffic from the north. It is already overwhelmed, and I am not aware there are any plans for its improvement. (0096 0112-2)

> ***Response:*** *The recommended improvements are not proposed as part of the Project. These improvements would be the responsibility of VDOT and the Project Team has shared your comment with VDOT.*

Change in Character of Roadways

Public Comment: VDOT will only consider making changes to abatement measures on VDOT-run roads such as the Connector Road, if there has been a change in the "character" of the road. What are the legal standards for determining whether the addition of the Dulles Toll Road and the Dulles Greenway (which feed traffic to the Connector) constitute a change in the "character" of the Dulles Connector? (0025 0026-7)

> ***Response:*** *VDOT's noise abatement policy is summarized below:*

> ***STATE NOISE ABATEMENT POLICY***
> *It is the policy of the Virginia Department of Transportation (VDOT) to employ the following criteria and procedures in determining the need for and the reasonableness and feasibility of noise abatement measures along Virginia's highways. The U. S. Code of Federal Regulations Part 772 (23 CFR 772) will be the guiding document for the analysis and abatement of highway traffic noise.*
>
> ***TYPE I PROJECTS***
> *A Type I project involves the construction of a highway on new location or the physical alteration of an existing highway which significantly changes the horizontal or vertical alignment or increases the number of through traffic lanes. When the abatement criteria contained in this policy are satisfied in conjunction with a Type I project, noise abatement must be provided.*
>
> ***TYPE II PROJECTS (RETROFIT)***
> *A Type II or retrofit project involves the construction of noise abatement along an existing highway when not in conjunction with an improvement of that highway. VDOT does not participate in Type II or retrofit noise abatement.*

Need for Traffic Calming Features

Public Comment: [Our community needs] speed bumps (for the cut through speeders) and sidewalks. (0121 0155-2)

Public Comment: Traffic calming based on anticipated future volume of traffic and put into place before the new rail and WFC park-and-ride facilities open. Traffic calming measures for communities in the

vicinity of Metrorail stations impacted by the new line should be included in the project budget. (0026 0027-7) (0087 0102-8) (0089 0104-8) (0099 0115-8) (0104 0121-6)

> ***Response:*** *Traffic calming measures are tools made available to communities to alter traffic characteristics within that community. VDOT has a process through which individual communities can investigate and request the implementation of traffic calming measures which best suit their needs.*

Roadway Congestion Impacts

Public Comment: Our research has indicated that urban areas that invested in rail have worse traffic congestion than urban areas that haven't. The reason is the money is better spent in other ways. Please confirm or deny this conclusion. (0061 0069-11) (0061 0117-4)

> ***Response:*** *Over the next twenty years, congestion in the Dulles Corridor and the region will be increasing due to forecasted increases in population and employment growth. The two Build Alternatives of the Final EIS will provide an alternative mode of transportation within the region. While it is stated in the Final EIS that the project alone will not solve the current congestion problems, the Project would increase the capacity of the transportation system in the Dulles Corridor.*

Public Comment: The most intractable problem, north-south travel, is made worse with Dulles Rail. (0061 0069-12)

> ***Response:*** *The traffic analysis completed for the Draft EIS and Final EIS has not shown that north-south travel in the Dulles Corridor will be worsened under the two Build Alternatives, relative to the No Build Alternative.*

Public Comment: our research indicates that the complete 22-mile project will only take about 5,000 cars off the road by the time it is finished in 2025. 5,000 cars a day is about the annual of traffic growth along the Dulles Corridor. Accordingly, we do not believe the Dulles Rail will have a significant impact on traffic congestion. In fact, it will have almost no effect. Please confirm these numbers or provide a comparable analysis. (0061 0069-2)

Public Comment: Our research indicates that the complete 22-mile project will only take about 5,000 cars off the road by the time it is finished in 2025. Now, 5,000 cars a day is about the annual rate of traffic growth along the Dulles Toll Road. (0061 0136-2)

Public Comment: Our research indicates that the complete 22-mile project will only take about 5,000 cars off the road by the time it is finished in 2025. 5,000 cars per day is about the annual rate of traffic growth along the Dulles Corridor. Accordingly, we do not believe that Dulles Rail will have a significant impact on traffic reduction, in fact, it will have almost no effect. Please confirm or modify these numbers. (0061 0117-1)

> ***Response:*** *As presented in Chapter 6 of the Final EIS, the total number of new transit trips estimated for the entire region as a result of the implementation of the Full LPA is approximately 48,000.. With assumed average vehicle occupancy of 1.1, this translates into 43,000 fewer automobile trips regionally. However, congestion is still expected to continue due to expected population and employment growth, as it is in the No Build Alternative.*

Public Comment: The project team failed to provide data on intersection levels of service in the planned opening year (2009) either. Congestion relief is by far the most important “need” in the D.C. area (0016 0122-13)

> ***Response:*** *The Traffic Analysis Technical Report prepared in support of the Final EIS contains the requested information.*

Public Comment: h. The claim that some 257.4 million VHTs will be eliminated needs to be revised and based on realistic ridership data, as well as straightforward traffic modeling that accounts for motorists who will congest arterial routes rather than pay either increased tolls (i.e., tolls that will rise substantially as partial payment of a local or state funding share), or the hefty cost of a Metrorail ride to/from/beyond/within this Dulles Corridor area. (0068 0173-25)

> ***Response:*** *The Dulles Toll Road toll structure and the Metrorail fares were inputs to the travel demand forecast model. The model's output was the basis for the analysis of traffic effects for both the Full LPA and the Wiehle Avenue Extension presented in the Final EIS.*

Air Quality Impacts

Public Comment: The purpose and need says that the purpose of this is because the toll road is going to exceed capacity. It talks about the degradation of air quality, however, if you look in the details, you will see this quote: "The implementation of the proposed LPA and specifically the provision or expansion of Park & Ride and Kiss & Ride facilities would result in increased traffic on local roadways around stations." In fact, there are going to be six Stanley (ph) intersections with this LPA, and you didn't even provide, as far as I can tell, what the no build would do for this phase. (0016 0140-3)

> ***Response:*** *The air quality analysis provided for the Dulles Corridor Rapid Transit Project evaluated several of the "worst case" intersections within the project corridor in order to determine whether the potential for exceeding the National Ambient Air Quality Standards (NAAQS) was likely to occur. As reported in the Chapter 4 of the Final EIS, no non-conformance with those standards is anticipated to occur at any of the intersections in the Project corridor. In fact, in nearly all cases anticipated CO levels are predicted to be below the NAAQS.*

Concerns about Traffic Impacts in Vicinity of Wiehle Avenue Station

Public Comment: Wiehle Ave. and the adjacent arterials of Sunrise Valley Drive and Sunset Hills road are already operating at failing levels of service, but Phase I calls for a terminal station at Wiehle Avenue. This will have the effect of taking traffic off the Toll Road and increasing it on our local roads - roads which were designed years ago for much lower traffic volumes and frequently have serious accidents. Correcting these problems could literally be a matter of life and death for Reston's citizens. Given the safety concerns, what planned road improvements are proposed to mitigate these substandard conditions and where is the funding coming from? (0038 0039-1)

Public Comment: It can be very difficult today to turn in and out of parking areas along Wiehle and Sunset Hills Road. The Wiehle terminus will most certainly cause a dramatic increase in traffic volume at these entrances. Has a traffic study been conducted to determine if the minimal improvements proposed in the DEIS will solve these problems? And where will the money come from for these or other required improvements which might be revealed by a future traffic study? (0038 0039-2)

Public Comment: The eastbound exit off the Toll Road at Wiehle Avenue frequently backs up during the AM peak hour. And traffic is already bumper-to-bumper on the Toll Road between Wiehle and Reston Parkway. I'm concerned that the additional cars and buses exiting at Wiehle will cause east-bound traffic on the Toll Road to back up into the Reston Parkway on-ramp causing Reston Parkway itself to fail. Have you studied this potential impact? (0038 0039-3)

Public Comment: Wiehle Avenue is a four-lane road that terminates in a T-intersection at Sunrise Valley Drive. It is already a major rush hour bottleneck. We are concerned that our roads will fail with the added traffic created by a terminus station. (0039 0040-3)

Public Comment: Reston Association requests that Fairfax County initiate a comprehensive Planning Study to assess the traffic and parking impacts of ending the first phase at Wiehle Avenue and to make

recommendations for improvements to accommodate these impacts. Such study should include at a minimum:
- Impact of increased vehicular traffic on Reston roadway system and environment.
- Increase of the traffic capacity of access roadways within Reston and its approaches.
- Intersection improvements and traffic controls.
- Investigation of accelerating the expansion of Herndon/Monroe parking facilities.
- Limited parking at the Wiehle Avenue station to serve only the immediate Reston area.
- Commitment to policies that will limit parking demand at Wiehle Avenue.
- Consideration of permit parking for residents.
- Potential for cut-through traffic on residential streets/traffic calming considerations.
- Increase of bus service within the Reston area so that Reston residents can easily access the station without driving to it.
- Pedestrian and bicycle access in and around Reston to facilitate safe and efficient access to stations, especially provision of convenient, grade-separated, direct pedestrian and bicycle access from all four quadrants of the Wiehle Avenue interchange. (0039 0040-8) (0040 0041-5)

Public Comment: What provisions have been made to mitigate the impact on access thoroughfares? (0042 0043-6)

Public Comment: How will the nearby roads be impacted by a station at this location (Wiehle, Sunrise and Sunset Avenues, including the connecting intersections to these roads such as North Shore-Wiehle, and Fairway- Wiehle)? (0042 0043-7)

Public Comment: 2) Whiele Avenue is already overcrowded at rush hour and this plan would only draw in a heck of a lot more traffic that the existing road infrastructure could not handle - getting to and out of the Whiele Avenue facility would be a nightmare, and 3) that proposal does nothing to alleviate airport traffic at one of the country's fastest growing airports as it would not provide rail access to the airport. (0046 0047-2)

Public Comment: The Wiehle Avenue / Dulles Toll and Access Road interchange will fail as presently configured when it tries to serve all the traffic at the interim terminus. It needs to be reconfigured as a cloverleaf or some other design that reduces the number of stop lights (0064 0152-5)

Public Comment: The SDEIS fails to assess the impact of use of the Wiehle Avenue area as an “interim” terminus point. The environmental, social impact and financial impact needs to be evaluated in terms of incremental impact on arterial roads congestion, wasted time in the resulting additional gridlock due to drivers trying to reach the station, where turn-away parkers will park and impede normal uses, etc. (0068 0173-13)

Public Comment: That intersection, Wiehle and Sunset Hills, is already congested beyond belief. The proposal that is presented here is to add a lane into Kaiser, a left lane, a direct lane onto the expressway and a right-turn lane for westbound Sunrise Valley onto Wiehle. These are totally inadequate. They should be there now. Adding traffic to this will be even worse. (0073 0083-2)

Public Comment: Right now Wiehle Avenue between 7:30 and 9:00 a.m. is a parking lot from Lake Anne to the Dulles Toll Road! In the evening between 4:30 and 6:00 it is almost as bad, making it very difficult for cluster residents and all users of Wiehle to travel that short section in a reasonable time! As a result drivers are frustrated and are becoming more and more aggressive as they try to commute to and from work! Cluster residents also find it more and more difficult to exit onto Wiehle because these frustrated motorists come barreling around the curve just before our cluster entrance in their rush to make their commute just a little bit shorter. (0094 0110-2)

Public Comment: By making this station the end of the line, traffic will be impossible. Our emergency services are going to be impacted by traffic delays. The fire station at that intersection is one of the busiest in the county 7 and response times will increase as they try to get through the clogged intersections. (0098 0114-2)

Public Comment: I hope that in all your deliberations regarding the Rail to Dulles project you seriously consider the traffic patterns, and problems associated with having a terminal at Wiehle Ave. I am all for the rail and a station at Wiehle, however, I am at a loss as to what will be done with all the cars that will have to access the station. Are there any plans to either widen Wiehle, or create another road (I know not where!!)? (0103 0120-1)

Public Comment: I have seen traffic, congestion, pollution and dangerous driving increase in Reston, and on Wiehle specifically. Potentially widening Wiehle to accommodate commuters to drive to the Wiehle station will only make these factors worse, not better (0105 0123-2)

Public Comment: The short-term thinking behind the scheme to make Wiehle Avenue a "temporary" terminus for the Dulles Rail project is an absolute negative. The heart of Reston is NOT Dulles. Nothing would be accomplished other than to crowd the Dulles Toll Road even more as commuter would attempt to reach Reston and limited parking so as to board a metro train. (0056 0057-1)

> ***Response:*** *With Wiehle Avenue as the interim end-of-line station for the Wiehle Avenue Extension, there will be more bus and Kiss & Ride activity in the morning and evening peak periods than with the Station as an intermediate station. The park-and-ride traffic for the 2,300 space structure would, however, be identical to that when Wiehle Avenue Station is an intermediate station along the 23-mile extension of Metrorail. Moreover, the park-and-ride structure will likely be full before the local peak hour of the Reston; in other words, the final park-and-ride customers of Metrorail would arrive before 7:30 a.m. while the local peak hour would be between 7:30 a.m. and 8:30 am. Additional analysis of traffic effects for both the Full LPA and the Wiehle Avenue Extension has been conducted in support of the Final EIS and mitigation measures for anticipated effects have been identified.*

Public Comment: Also, these ridership estimates are based on road improvements in the Wiehle area as well and yet no one knows where that money will come from. (0062 0070-3)

> ***Response****: The planned roadway improvements of the region's Constrained Long Range Plan were inputs to the travel demand forecast model. By the term 'Constrained' it is meant that region has the financial capacity to fund the roadway improvements.*

Concern about Neighborhood and Cut Through Traffic Impacts

Public Comment: On page 276 the Dulles rail public hearings report admits that analysis was done only on intersections nearby the WFC station, not on neighborhood streets. There is therefore insufficient data to conclude that there will not be an increase in cut-through traffic impacting the Westhampton neighborhood. (0026 0027-12)

Public Comment: The Draft EIS did not adequately study or address the traffic impact on Westhampton associated with Metro patrons using either the WFC park-and-ride structure or the East Falls Church (EFC) station to access the new rail line. We continue to have concerns with the project's analysis of traffic impacts around the WFC station and its conclusion that there is no traffic impact of the Dulles rail project on Westhampton. (0026 0027-4)

Public Comment: More study on the traffic impact on Westhampton from Metro patrons driving to the WFC park-and- ride structure or the East Falls Church and Tysons stations to access the new rail line. (0087 0102-7) (0099 0115-7) (0089 0104-7) (0104 0121-5)

> ***Response:*** *Large increases in the number of vehicle trips are not anticipated in the West Falls Church Station area due to the Project. The Project will initially divert a number of Metrorail customers from this station to the Dulles Corridor stations. Over time, due to population growth and latent demand not directly associated with the project, the traffic activity at West Falls Church*

Station will return to its former level. Nevertheless, the Project Team does not anticipate any increases in project-related cut-through traffic in the Westhampton neighborhood.

Compatibility with High Occupancy Toll (HOT) Lanes

Public Comment: Explain how the Silver Line would be compatible with HOT lanes in the Dulles Corridor in terms of right of way availability. How will the proposed interchange with the I-495 HOT lanes be done? (0061 0117-21)

Response: *The issues associated with implementing a high-occupancy toll system in the Dulles Corridor and the possible benefits of such a system were explored as part of the Project Team's review of Dulles Plan B.*

Numerous physical, technological, and social issues may limit the ability to implement high-occupancy toll lanes in the Dulles Corridor. The analysis also showed that high-occupancy toll lanes might not have substantial mobility benefits in the corridor. If solo drivers were allowed to use the HOV lane for a fee, then it is very likely that a large percentage of the HOV lane users in the Dulles Corridor would be single-occupant vehicles, reducing the average vehicle occupancy in the HOV lane. Therefore, increased use of the HOV lane under a high-occupancy toll system would result in minimal increases in the lane's person-moving capacity, and could result in a reduction in the lane's person-moving capacity.

As the owner and operator of the Dulles Toll Road (and other major HOV facilities in the region), it would be VDOT's responsibility to fully evaluate and implement any proposals that allow travelers driving alone to use the HOV lanes during peak hours for a fee ("value pricing"). Such value pricing systems would require would require in-depth study. Issues include the lack of space for barrier-separation, technological challenges associated with a non-barrier-separated system, and equity considerations.

The Project Team's analysis relative to Dulles Plan B also showed that high-occupancy toll lanes might not have substantial mobility benefits in the Dulles Corridor. To remain an attractive alternative to the general traffic lanes, the HOV lanes on the Dulles Toll Road should not operate at their maximum level of capacity. If operated at 80 percent of their hourly capacity (a level that provides for congested, but relatively free flowing traffic), each lane could support 1,920 passenger cars in the peak hour—an increase of only 720 cars over the current and projected use of the HOV lanes in the peak hour (1,200 cars per hour in the peak). With average vehicle occupancy of 2.2 persons per vehicle, the HOV lanes currently support 2,640 persons per lane (2.2 X 1,200) during the peak hour. If realistic vehicle occupancy assumptions were applied for different high-occupancy toll scenarios (approximately 1.5 to 1.6 persons per vehicle if single-occupant vehicles are allowed to use the HOV lane), each lane would support approximately 2,880 persons per hour (1.5 X 1,920) to 3,072 persons per hour (1.6 X 1,920). This volume would only constitute an increase of 200 to 450 persons per hour over the current peak usage of the HOV lanes.

Moreover, it is very unlikely that incentives to increase HOV use would only appeal to people who previously used the general traffic lanes. It is much more likely that some of the new HOV users would be persons that would have otherwise used the transit system, reducing the demand for transit in the corridor.

Impact of Density Bonuses on Ridership

Public Comment: In the DEIS and SDEIS, analysis of regional transportation plan projections indicate that the planned rail system will not reduce congestion. Even ridership projections for 2020 indicate that in the long term, rail will have no significant impact on traffic congestion. Based on the projected residential bonuses and commercial bonuses around the rail stations in Tysons Corner and at the Wiehle station,

what is the projected number of rail users for each station? What is the projected number that will come by automobile? (0109 0128-6)

> ***Response:*** *The impacts of density bonuses on ridership were calculated for the Draft EIS but were not in the Final EIS. The travel demand forecasts in the Final EIS are based on the Metropolitan Washington Council of Governments' Round 6.3 Cooperative Land Use Forecasts. The Round 6.3 forecasts represent the regionally adopted population and employment forecasts through 2025, for the metropolitan Washington area, including Fairfax and Loudoun County. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS. As noted, the Project Team did calculate ridership based on density bonuses in the Tysons Corner and Reston/Herndon areas for the purpose of assessing secondary traffic impacts in support of the Draft EIS, but these demand figures were not included in the Final EIS.*

6.3 Effects on Other Transportation Facilities and Services

A. Draft EIS Comments

State Agency Comments

Metrorail Extension in Dulles Greenway

State Comment: Dulles Greenway was recently widened to 6 lines from Mainline Barrier Toll Plaza to Route 659. This generally leaves a median of 40' beyond shoulder (20' each side). Rail plans should update base as some locations may require more extensive roadway work. (0421, 0421-A –29)

> ***Response:*** *The final General Plans (Final EIS Volume VI) uses recent digital aerial photography that depict the six-lane Dulles Greenway. For the proposed General Plans (June 2002) and for the Draft EIS (June 2002), the Project Team had evaluated the Project in a median of a future six-lane Greenway.*

Regional Agency Comments

Vertical Conflicts with Metrorail Profile

Regional Comment: Vertically, the Metrorail profile is in conflict with several of our proposed roadways, including EB-CD Rd., Ramp C and the entire Aviation Drive Ext./Rudder Rd. intersection. Each of these roadways have been set vertically to meet FAA airspace vertical clearances for Part 77 surfaces and proposed structures, so raising their profiles would not be feasible. (0440, 0440-A –15)

Response: *The Project's preliminary analysis did not indicate a conflict between the Metrorail Extension and the proposed Airport roadways. The horizontal Metrorail alignment intersects the proposed new roadways at five points and also intersects the detoured SE loop at three points. The only intersecting points not included in the analysis were the detoured SE Loops, which were assumed to remain near current elevations that pose no conflict with the vertical Metrorail alignment. The near horizontal intersection of Metrorail with Ramp B has a vertical separation of approximately 20 ft from the top of the underground structure to the top of the aerial structure (Ramp B). A detailed analysis would be conducted during preliminary engineering phase and modifications made, as required, to minimize the effect on proposed Airport roadways.*

Study Widening of DIAAH

Regional Comment: Preliminary engineering for this project should study the widening of the Dulles Airport Access Highway (DAAH) to six lanes in sufficient enough detail to determine what accommodations will be required to allow both projects to be accomplished. (0440, 0440-A –11)

Regional Comment: The Airports Authority, as stewards of the Dulles Corridor, has an interest in optimizing the throughput of the corridor while maintaining access to Dulles. Accordingly, the Airports Authority would like to emphasize our future plans to widen the DIAAH to six lanes and the need for the Dulles Corridor Rapid Transit Project not to infringe on the right-of-way for this future widening. (0440, 0440-A –2)

> ***Response:*** *The final General Plans of the Metrorail Extension do not preclude the construction of the third lane of the DIAAH in either direction. If the third lane of the DIAAH is constructed after construction of the Metrorail Extension, then there will be impacts to the westbound Herndon-Monroe Park and Ride access bridge and relocations required of the Dulles Toll Road in the vicinity of the Herndon-Monroe and Route 28 Stations. The DIAAH shoulder widths may be less than standard widths, especially at the bridge underpasses to allow for a six lane DIAAH.*

Tunnel Construction is Assumed

Regional Comment: The Airports Authority's expectation, though not specified in the documents, is that between both portals and the station, a tunneling construction method will be used which does not impact existing roads or facilities. (0440, 0440-A –14)

> ***Response:*** *The final General Plans for the underground section of the Metrorail Extension through Dulles Airport indicates a cut-and-cover construction. As part of the cost-reduction exercises undertaken in the summer of 2001, the profile of the underground section was raised to accommodate cut-and-cover construction. During past coordination with MWAA, the Project Team noted that the cut-and-cover alignment with the "higher" vertical profile would become part of the General Plans and included as part of the Final EIS. This method would require temporary disruptions to surface facilities and possibly warrant the construction of roadway decking, temporary roads and temporary facilities during the construction of the Metrorail Extension. Other construction methods that would minimize effects on the existing roadways may be considered during preliminary engineering.*

Coordinate With MWAA and FAA on Station Portal

Regional Comment: The eastern portal at station 1590+00 is within the runway protection zone of runway 1R-19L. Accordingly, extensive coordination with the Airports Authority and FAA will be required and height restrictions will be imposed on cranes and equipment during construction. (0440, 0440-A –16)

Response: *Consideration was given during preparation of the General Plans to the required height restrictions for cranes and equipment during construction of the Metrorail Extension. A portion of the Metrorail alignment is within the Glide Path for runway 1R-19L. Preliminary analysis determined the Glide Path elevations restrictions for this section ranged from 334 to 344 feet. Based on ground elevations at this section, cranes or other equipment could range from 20 to 40 feet high. During preliminary engineering, DRPT and WMATA will continue to coordinate with the Airport Authority and FAA to ensure compliance with these restrictions.*

Public Comments

Feeder Bus Services, Bus Service to Smithsonian Air and Space Museum, and CIT Station

Public Comment: It is essential to provide for effective bus linkage to the Dulles Center of Smithsonian Air and Space Museum and to employment centers throughout the Route 28 Corridor from the CIT / Dulles Station. Careful consideration must be given to bus service and access between this station and the Dulles Center of the National Air and Space Museum over and above usual feeder bus access. The planning for this station must give special attention to accommodating a future light rail or other permanent transit linkage with I-66 utilizing the Route 28 Corridor. (0088, 0211-M –17)

Public Comment: It is essential that we provide better -- or think out a bus linkage between probably the CIT station and the Smithsonian Air and Space Museum, which is nearly a reality in Dulles airport. That has not been given as much thought as it deserves. That's more than just a feeder bus. (088, 0172-T – 8)

Public Comment: Impact of the Air and Space Museum Annex annual visitor load requires additional clarification in terms of connectivity to DCRTF and a model (estimate) of visitor routes traveling to and from the facility; i.e.., the A&S Museum is projected to attract 3+M visitors a year. This equates to approximately 8,200 visitors per day.

- What mode of travel will these visitors use to the facility?
- How many may be expected to use a DCRTF?
- What are the expected routes to be used? (0427, 0427-E –4)

Public Comment: If we are really going to have a mass transit system that works, effective access to each station must be an essential element of design criteria. Each station must incorporate facilities for the use of present and future feeder systems so that there are minimal conflicts between and among the feeder buses, the cars and the pedestrians. Effective use of these stations is vital to their use by transit ridership. (0204, 0247-T –7)

Public Comment: We strongly support the construction of the CIT Dulles station. This is key if Route 28 is to have mass transit system which one day it assuredly must have, particularly with the Air and Space Museum opening to the public next year. (0204, 0247-T –8)

Public Comment: The Committee for Dulles supports the construction of the CIT/Dulles Station rail station near Rock Hill Road southwest of Herndon. The Committee for Dulles urges that careful consideration be given to bus access between this station and the Smithsonian Air and Space Dulles Center complex over and above usual feeder bus access. The planning for this station should give special attention to accommodating a future light rail or other permanent transit linkage with I-66 utilizing the Route 28 Corridor. (0204,0204-M –10) (0244, 0244-T-6)

> ***Response:*** *The Smithsonian Institution has established a shuttle bus service between the National Air and Space Museum's main building in Washington D.C. and the Udvar-Hazy Center. Buses run simultaneously from either location on the same departure schedule.*
>
> *Accommodating light rail transit along Route 28 was evaluated by the Project Team but was eliminated from further consideration because plans for a Route 28 LRT system have not been developed to a level that would make it appropriate or feasible to conduct detailed coordination efforts related to these improvements (see Chapter 2 and Appendix H of the Final EIS).*
>
> *Coordination with potential rail improvements in the Route 28 corridor was requested during the scoping process for the preparation of the Draft EIS. This alternative was evaluated during the early stages of the Dulles Corridor Rapid Transit Project, and was eliminated from further study. The reasons for the elimination of this alternative are fully detailed in the Final Alternatives Analysis Report (May 2001).*

Focus on Transit-Oriented Development and Pedestrian Access

Public Comment: So this transit oriented development has a significant impact on the number of riders that would use the system, and also happily we saw that the number of people that could walk or bike access to the stations dramatically increased. And I was particularly interested in that because the current EIS only shows 20 people walking to the station at Route 606. So we think that you will get a lot better use if you scale back the parking and focus on the transit oriented development at that particular site. (0141, 0243-T –6)

> ***Response****: As evaluated in the Supplemental Draft EIS as a revision to the selected LPA and further documented in the Final EIS and final General Plans, the Project Team reconfigured the*

park-and-ride program in Loudoun County. Route 772 Station increased from no park-and-ride facility to two structures of 3,300 spaces combined. Route 606 Station decreased from 4,750 spaces to 2,750 spaces.

During preliminary engineering, the Project Team will coordinate with Loudoun County and the owner/developer of the land north of the Route 606 Station to achieve efficient and pedestrian friendly connections between the proposed development and the station.

Transit Connectivity in Loudoun and Fairfax Counties is Needed

Public Comment: The main points I would like to make in terms of our needs here in Loudoun and commenting on public transit in general, and I would like to refer to a previous comment by one of the speakers who lived in Sterling is that in Loudoun County we do not have transit connectedness, and I think he used the word connectivity. We do have an accessible public transit system that goes into most of our neighborhoods. It is very rudimentary I guess is the best word for it. So in considering a Dulles Corridor Rapid Transit Project, it is very important that we have that connectedness and an expansion of transit within Loudoun County so that people who prefer not to drive or cannot drive can use a public transit system that is accessible in this county in order to access any rapid transit that is available. (0259, 0259-T –3)

Public Comment: My biggest concern at this point is that - and this has been echoed as well - that the connectivity for people in communities like Sterling park, like Cascades or Countryside, like those south of the Toll Road in Fairfax County, are considered, and that the design option that is chosen allows for adequate bus and feeder systems, whether they're WMATA buses or Loudoun County buses or Fairfax Connector buses. (0265, 0265-T –2)

Response*: The Dulles Corridor Metrorail Extension will significantly increase the opportunities for Loudoun County residents to make convenient and quick trips via transit. However, Loudoun County will have the responsibility for increasing the transit network in the county beyond the Metrorail station areas. This Project will support an expansion of the Loudoun County Transit network but the responsibility for implementing this expansion will rest with the county.*

Concern About New Riders, Congestion Relief, and Land Use Densities

Public Comment: WMATA and its consultants have not provided solid data on actual NEW riders for BRT or rail service, they have provided no data on congestion relief for the toll road and other roads, and there are assumptions about land-use densities to provide transit-serviceability that are questionable. (0112, 0269-M –2)

Response: *Table 6.1.3 in the Final EIS shows the estimated new trips for the two Build Alternatives. Section 6.2 of the Final EIS shows levels of service for key highway links and direction including the Dulles Connector Road, the Dulles Airport Access Road, and the Dulles Toll Road.*

The travel demand forecasts in the Final EIS are based on the Metropolitan Washington Council of Governments' Round 6.3 Cooperative Land Use Forecasts. The Round 6.3 forecasts represent the regionally adopted population and employment forecasts through 2025, for the metropolitan Washington area, including Fairfax and Loudoun counties. By federal regulation, such regionally approved land use forecasts must be used in the travel demand analysis of each alternative studied in an EIS.

Circulation Within Tysons Corner Area

Public Comment: The two largest employment centers where Kings Park residents work are D.C. and Tysons, and I would like to ensure Kings Park residents commuting by future beltway, HOV express

buses can rapidly circulate within Tysons once arriving in Tysons by express bus or future Purple Line beltway rail. (0134, 0134-T –6)

> ***Response:*** *Circulation within Tysons Corner via transit was a key focus of the Project Team when developing the feeder bus plans for the Wiehle Avenue Extension. This service includes both Fairfax Connector service as well as WMATA Metrobus service. In addition to existing services, new Tysons circulator services are recommended to provide internal circulation for Metrorail riders alighting at Tysons Corner stations. Intermodal facilities are also proposed at the Tysons East and Tysons West stations as well as at Tysons Central 123 Station. These facilities would be able to handle additional circulator services that may be implemented in the future.*

Stations and Service Frequency in Tysons Corner Area

Public Comment: I firmly believe that the number of stations and the frequency of service is critical to intra-Tysons Corner transit. This fact should be incorporated into the Dulles Rail design. (0178, 0178-T –7)

> ***Response:*** *The number of stations or stops and frequency of service are critical elements of design for all transit systems. These issues were taken into account when planning and designing the Dulles Corridor Rapid Transit Project. The Wiehle Avenue Extension includes four stations in Tysons Corner and will operate on 7-minute headways during the peak period.*

Travel Times Through Tysons Corner Area

Public Comment: Furthermore, the four proposed Tysons rail stations will add a significant amount of time to the running time of "rapid transit system" making it less "rapid" and will more than likely be a construction bottleneck delaying the actual opening of the rail system. (0233, 0426-M –29)

> ***Response****: The four Metrorail stations within Tysons Corner are more than one-half mile apart. This is not unreasonable for a dense urban area such as Tysons Corner. Since many people will be walking to or from the station, spacing stations any further apart than this could result in excessive walk times and distances, thus lowering transit ridership. Construction in Tysons Corner is not anticipated to delay the opening of the Wiehle Avenue Extension..*

Interim Bus Improvements Needed

Public Comment: It appears to us that the best transition to rail would be to further improve the existing bus service in the Dulles Corridor as the interim step towards rail. For example, we would like to see the #505 bus increased in frequency during off peak hours and on weekends from the present every thirty-minute schedule to every fifteen minutes. Ideally during off peak hours, a #505 bus should leave after every westbound train arrival at Metro's West Falls Church Station. With the improvements in frequency of the #505 bus, there should also be matching improvements in the Reston Internal Buses that are coordinated with it at the Reston Town Center transfer point. (0005, 0005-L –2)

> ***Response:*** *The bus operations plans included in the No-Build and the two Build Alternatives of the Final EIS reflect Fairfax County's current bus service expansion plans. In addition, the modifications of the Fairfax County plans were developed in consultation with technical staff from Fairfax County. The County's expansion plans are based on their estimates of demand for Fairfax Connector service on each route. The service frequencies on these routes, in turn, reflect this estimated demand. In addition to estimates completed by Fairfax County, bus ridership by route was forecasted for the No-Build and Build Alternatives using the Project's travel demand forecasting model. These ridership estimates were used to supplement Fairfax County estimates and acted as inputs into the final bus plans.*

Expand the Fairfax County Connector Bus Fleet

Public Comment: Further improvements in the frequency of Dulles Corridor buses is constrained now by the number of buses Fairfax County has in its Connector inventory. BRT funds would be better utilized to expand the number of buses Fairfax County has in its inventory and provide operating funds for them. The bus frequencies could be increased to provide actual ridership numbers to better guide planners of the future rail system. (0005, 0005-L –3)

> ***Response:*** *The elimination of BRT (as analyzed in the Draft EIS) would not have released more funds for the operations of the Fairfax Connector express service. Specifically, the Federal funds that would have been used to fund the BRT were different from the funds that would be used to purchase new buses for the Fairfax Connector. The BRT Alternative would have been funded under the Federal New Starts program, while County bus purchases would have no Federal funds.*

BRT Impacts to Corridor Bus Service

Public Comment: The non-stop BRT service between Herndon and West Falls Church would be no better than the present Bus Route 980 service. Reston service, however, would be severely degraded by BRT. Five direct-to-Reston bus routes would have to be eliminated and all of their riders would have to make an extra transfer. The first transfer may be possible to coordinate, but two transfers on one trip are very difficult to coordinate. (0013, 0013-L –17)

> ***Response:*** *BRT was eliminated from further consideration after the public and agency review and comment on the Draft EIS. BRT would have provided comparable service to the 950/980 services in the peak period but would have provided more frequent service (12 minutes frequency versus 30 minute frequency) during the mid-day. It would also have provided more frequent service to the Tysons area than the current 984 service.*
>
> *It is true some services from the Reston area that currently run directly to West Falls Church would have been modified to act as feeders to BRT. The high frequency of BRT service from Herndon-Monroe and Reston would have mitigated against a long wait for transferring passengers from these feeder routes, while BRT would have provided benefits such as higher passenger carrying capacity, higher frequencies to Tysons Corner, and better mid-day frequencies than exist under the current Fairfax Connector service.*

Route 7 Bus Service Needed

Public Comment: Serious consideration should be given to creating bus service on Rt. 7 West of garage at Tysons West. (0045, 0045-CC-1)

> ***Response:*** *Fairfax Connector Route 574 currently runs between Reston and Tysons Corner via Route 7 (Leesburg Pike). It is currently planned that this service would remain in place after the implementation of the Wiehle Avenue Extension.*

Add BRT Characteristics to Express Bus System

Public Comment: Many BRT characteristics should be incorporated in an improved express bus system, and I have a list of those. Strategies for reducing operating subsidy requirements and making the system profitable. (0173, 0173-T –9)

> ***Response:*** *Three BRT alignment options were considered in the Draft EIS. BRT 3 most resembled the existing express bus system, but with trips from more origins within the corridor than currently in place, as well as more trips oriented to Tysons than are currently in place. In addition, BRT 3 assumed a reduced number of BRT facilities. There would be only one median BRT station, located at Reston Parkway. Off-line stations were assumed at all other locations.*

The Herndon-Monroe and Wiehle Avenue stops would have been at the existing park and ride facilities. The total new transit trips resulting from implementation of BRT 3 would have been the lowest of the three BRT alignment options (10,900 versus 12,500 for BRT 1, which least resembled the existing express bus system). More detailed descriptions of each BRT option are contained in the Transit Operations and Maintenance Plan (June 2002) prepared in support of the Draft EIS.

Feeder Bus System Access to Stations is Important

Public Comment: A well developed feeder bus system with exclusive access lanes where feasible is essential to this rail transit extension. Each station must be carefully designed to assure that future expansion of feeder bus access can be readily implemented. Kiss and ride drop-off points must fit conveniently into this mix. Considerable care must be put forth to minimize potential conflicts between feeder buses, automobiles and pedestrians. Where feasible, exclusive feeder bus lanes must be developed in the vicinity of station sites. Transit ridership would be severely reduced by traffic congestion that makes the use of the feeder bus no more effective than the use of the private car. (0088, 0211-M –11)

Public Comment: An essential element of the design of each rail station in the Dulles Corridor is effective access via a well-developed feeder bus system. Each station must be carefully designed to assure that future expansion of feeder bus access can be readily implemented. Kiss and ride drop-off points must fit conveniently into this mix. Considerable care should be put forth to minimize potential conflicts between feeder buses, automobiles and pedestrians. To the extent possible, exclusive feeder bus lanes should be developed in the vicinity of station sites. Transit ridership would be severely reduced by traffic congestion that makes the use of the feeder bus no more effective than the use of the private car. Over time, it is possible that some form of internal shuttle bus/people mover system will become economically feasible to serve the urban centers. Close coordination among VDRPT, WMATA, VDOT and local planning officials is essential to assure that the feeder bus system works effectively. Local elected officials bear the primary responsibility in assuring that this close coordination exists. (0204, 0204-M –9)

Public Comment: Within each of these areas are multiple points of trip commencement and terminus that need to be serviced by a flexible surface system. A flexible surface system will be integrated to take a large portion of the surface congestion out of the transportation equation, while encouraging population circulation to the businesses, shopping and entertainment sites. (0148, 0148-T –4)

Public Comment: Traffic near the stations will increase. Saturation local bus service must be provided between the neighborhoods and transit stations to induce locals to stay away from their cars in getting to the Metro. Pedestrian routes and amenities must be enhanced. Consideration should be given to eliminating bus fares altogether for those using the busses to reach the stations. There should be similar consideration to eliminate the bus fares along the corridor to West Falls Church until Metrorail is available to reduce congestion, improve air quality, encourage transit use, begin to change commuting habits from SOV to transit. (0208, 0208-M –5)

Public Comment: And are there plans to make sure that the routes and schedules of local feeder bus systems are integrated with metro? Are there plans for local express bus service to the metro stations during rush hours, thereby reducing the need to build massive parking facilities? (0181, 0181-T –7)

Public Comment: Feeder bus system. We have made some references to it, but it is essential to making this process work. Not only do we need an effective feeder bus system, but it needs to be able to move to the transit stations, which means somehow building some type of exclusive busways in the vicinity of the transit stations. (088, 0172-T –6)

Public Comment: I realize that developing an adequate bus feeder system and controls on development along the corridor are not something your project team has any say in. But, having lived in Northern Virginia for many years and having visited large European cities that have a mix of bus, tram, and rail as

a way to move large numbers of people, it seems imperative that a complimentary feeder system is necessary to the success of rapid transit in the Dulles Corridor. (0401, 0401- L-5)

Public Comment: Feeder bus service to stations: The description in the draft EIS of the plans for feeder bus service to stations is completely inadequate. The EIS states that feeder bus service would be modified and refers to Chapter 6 and a separate technical study for details. However, Chapter 6 does not describe the changes or provide any details, and the technical study was almost impossible to obtain to review. The EIS should be revised to include specific information about the proposed feeder bus service for each alternative. (0392, 0392-L –10)

> ***Response:*** *The feeder bus network in the Dulles Corridor is an essential part of the overall corridor transit network. Station area planning and design included accommodating feeder buses (both access to the station and circulation within the station area) as an integral part of the overall process. Under the two Build Alternatives of the Final EIS, many of the stations in the Dulles project will become major intermodal centers within the corridor, and the planning and design of these stations reflects this. The bus service plans were developed in consultation with technical staff of Fairfax and Loudoun counties. The plans have been developed with a focus on providing service from multiple origins to multiple destinations in the counties, and are designed specifically to provide mobility options that are attractive relative to making a trip by private automobile. The Transit Operations and Maintenance Plan in support of the Final EIS contains detailed route descriptions.*
>
> *The ultimate responsibility for these feeder bus networks lies with the counties. The responsibility for determining the feasibility of the elimination of bus fares would ultimately reside with the three operating agencies: WMATA, the Fairfax Connector, and Loudoun County.*
>
> *Local express service to stations during rush hours was not considered as part of the plan because of the difficulty of providing express service from multiple origins. Feeder bus routes are generally short and have short trip times, thus making them attractive alternatives to the auto. Exclusive busways were not considered as part of the facility program for stations because it was determined that the positive impacts would be marginal relative to the cost and the difficulty of incorporating the busways into an already crowded street network.*

McLean / Tysons Corner Feeder Bus Services

Public Comment: McLean Access to Stations in Tysons Corner: All Build alternatives would provide Tysons Corner stations close to much of the McLean area. However, the EIS does not describe how McLean residents, especially residents east of the Dulles Toll Road, would be able to access these stations, since all proposed stations except Tysons West would not have any parking facilities. The EIS should be revised to described the feeder-bus system and the pedestrian and bicycle facilities that would be put in place to serve the McLean area. (0392, 0392-L –14)

Public Comment: I also think the issue of adequate feeder bus systems into these stations to reduce the amount of auto traffic and the amount of parking should be addressed in a more comprehensive way, with suggestions for possible solutions. (0284, 0284-T –3)

Public Comment: There is no mention of any feeder bus lines from my neighborhood [in McLean] towards Tysons, thus ensuring reliance upon our cars. (0233, 0426-M –25)

Public Comment: In the Tysons area, the rolling terrain area and the distances between the stations and some of the largest employers in the area (i.e. Gannett), it's highly unlikely that any of these stations will reach their full ridership potential without employee or residential shuttles or some other formal type of internal circulator system that may include buses, trams or some other mode(s) to link the entire area to the stations. However, for this internal circulator system to function properly, surface facilities need to be provided at each of the stations similar to what is proposed at Tysons East with the program of bus bays, shuttle bays, kiss & ride, taxi (and Flexcar?) spaces specifically tailored to the needs of the station service

areas for each alternative. A conceptual plan for an internal circulator system should be developed in conjunction with the Tysons community and should be a part of each alternative under consideration. (0387, 0387-L –11)

Public Comment: Address the increased need for feeder bus service centering on the 4 Tysons area stations, both for circulation access within Tysons and from McLean communities. (0392, 0392-L –3)

> ***Response:*** *Service between McLean and Tysons Corner is currently provided by the Metrobus 15, 23 and 24 Routes. These routes do not change under the Wiehle Avenue Extension. Route 15 would serve the Tysons East and Tysons Central 123 station. Route 23 would service the Tysons East, Tysons Central 123, and Tysons West Stations. Route 24 would serve the Tysons West Station. Comprehensive feeder bus plans have been developed for Wiehle Avenue Extension through Tysons Corner. These plans identify service frequencies throughout the day, number of trips, routings, and station/stops served. These plans were developed based on detailed consultation with technical staff from Fairfax and Loudoun counties. These plans also reflect county technical staff's estimates of demand for the feeder service as well as additional demand estimates developed by the Project Team.*
>
> *All station plans include on-and/or off-street passenger boarding space for private shuttle services and bicycle storage facilities.*

Tysons Center Remains an Important Bus Destination

Public Comment: We also note that the Center already is an important participant in the provision of transit service to and around Tysons Corner. The Center has several bus stops located on the private internal ring road of the Center between the Nordstrom parking structure and the neighboring Tycon Tower buildings located on Towers Crescent Drive. The buses that utilize this transit stop originate and terminate at various locations throughout Northern Virginia, including Arlington, Alexandria and existing WMATA facilities. We expect that these bus stops will remain active and utilized even with the extension of rail transit service, notwithstanding the additional bus service contemplated for the Tysons Corner area discussed below. (0406, 0406-L –2)

> ***Response****: With the Wiehle Avenue Extension, the existing bus stops in Tysons Corner Center would remain in place and continue to play an important intermodal role.*

Facilities for Feeder Bus System

Public Comment: Oh yes, I forgot about LINK and metro bus in Reston. Well if you ride LINK or metro bus, no bus stop tells you when the next bus is coming, you stand in the weather because there are no covered bus stops and you don't know what bus to take to where. I think it's called a feeder system. Is the improvement of that system covered in rail costs? It has to be improved or rail won't get many riders. (0233, 0426-M –17)

> ***Response****: The facility elements described by the commenter such as schedule information and shelters will remain the responsibility of the local transit operator, in this case, Fairfax County. All stations and stops would have bicycle racks and/or lockers adjacent to station entrances.*

B. Supplemental Draft EIS Comments

Public Comments

Clarification Regarding Premium Bus Service

Public Comment: The term "Premium Bus Service" still causes us concern. While we appreciate your email of February 17th on this subject, we still have concerns where the report speaks to this issue. We

need to fully address the concept of Premium Bus Service. The report has a limited definition on page 106, but to us this sounds very much like the service we are now providing.

Passengers will not be required to transfer to "Premium Bus Service" at the Rt. 606 station. Response should state Loudoun County is currently running service to Leesburg and that such service will continue. The wording in the Report appears to contradict your above referenced email.

"The premium bus service will replace express bus service currently run by Loudoun County into Roslyn and Downtown Washington". This is an incorrect statement. While we appreciate your email on this subject, this still needs to be corrected in the final document. (0084 6-1)

Public Comment: The Town Council appreciates the public outreach effort of the Virginia Department of Rail and Transportation on the Dulles Corridor Transportation Project. The town respectfully requests correction of error published in the draft EIS stating that premium bus service will replace current express bus service in Loudoun County. We understand from Loudoun County that the error will be corrected in the final publication and will reflect continued express bus service. (0142 6-1)

> ***Response:*** *The Final EIS ends the use of the phrase 'premium bus', since the service is a continuation of the existing express bus service of the two Counties and MWAA. The Project Team has recommended that until the opening of the Full LPA, the Wiehle Avenue Extension should retain this [bus] rapid transit service between Wiehle Avenue and Route 772. Where appropriate, routes would be reconfigured to optimize service to markets in the western portion of the Dulles Corridor. Loudoun County would, however, retain its current commuter service (Loudoun to Rosslyn and D.C.). Otherwise, all express bus services currently serving the West Falls Church Station will be directed to Wiehle Avenue Station.'*
>
> *The operators of this bus transit service in the Corridor, which the Supplemental Draft EIS described as premium bus service, would remain the two Counties. The two Counties would provide any additional vehicles for the service, purchasing them from funding sources other than the Project. MWAA will continue to use the Washington Flyer to provide bus service between the Airport and Wiehle Avenue Station.*

Retain Express Bus Service to West Falls Church

Public Comment: I wish to register my displeasure with the proposal to discontinue the express bus service between the Herndon Monroe Park and Ride and the West Falls Church Metrorail station under the Dulles Rail Proposal.

First of all, the buses that leave the Park and Ride currently are filled to capacity, more often than not with "standing room only." Assuming that the pending plan goes into effect (adding five more stops), how in the world are the vehicles expected to take on additional riders? And besides that, the plan for the rail line is to wind its way through the Tysons Corner area. Why are the bus stops, for all intents and purposes, a duplication of the areas to be serviced by rail?

The addition of an extra twenty minutes to our commuting time will be an additional burden. Having to get up even earlier than we do already is asking a lot of us commuters. In fact, right now it is just about dead even in commuting time between driving and using public transportation; the proposal to increase the daily commute by nearly four hours per week makes driving a lot more attractive. If enough citizens feel the same way, it will mean a drop in ridership (and revenue) for public transportation as well as an increase in pollution. (0143 6-1)

Public Comment: I am writing to express my dismay, and strong opposition, to the proposed discontinuation of express bus service between the Herndon-Monroe Park & Ride and West Falls Church Metro station as described in the Supplemental Draft Environmental Impact Statement, Hearing Report, February 2004 ("Report").

Thus commuters currently using Herndon-Monroe buses would have to 1) wait to board buses at Herndon-Monroe, 2) ride to the Wiehle Avenue Metro, 3) move from the bus to the Metro, 4) wait to board Metro, and 5) ride through, and stop at four Tysons Metro Stations. The existing commute between Herndon-Monroe and West Falls Church takes approximately 15-20 minutes. It is inconceivable that the proposed route of Herndon-Monroe --> Wiehle --> Tysons Corner --> East Falls Church would not considerably lengthen I would estimate that the proposed route would nearly double to 15-20 minute Herndon-Monroe to West Falls Church commute.

Of course, an alternative to such a route would entail commuters driving directly from their homes to the Wiehle Avenue Metro. This would: 1) increase traffic on the roads leading to the Wiehle Avenue station, and 2) require that the already inadequate parking at the Wiehle Avenue be greatly expanded. Such an expansion, should it occur, would have to be a multi-level garage in order to accommodate the diversion of riders from Herndon-Monroe to Wiehle. And of course, the Herndon-Monroe garage would be vastly under-utilized and result in a huge waste of resources.

If Metro were extended all the way out to Herndon-Monroe, then the proposed elimination of the express bus service between Herndon-Monroe and West Falls Church would make sense. Absent such extension, the proposal promises nothing but additional hassle for commuters. (0144 6-1)

> ***Response:*** *The Project Team has not stated that the travel time would increase by 20 minutes. The express bus service from Herndon-Monroe to Wiehle Avenue Station has been designed to be a very high frequency shuttle to Wiehle Avenue for those drivers who will not be able to find a park-and-ride space at Wiehle Avenue Station. The intent is to make Herndon-Monroe a viable satellite facility through the provision of a very convenient shuttle service providing direct service into Wiehle Avenue Station pavilions.*
>
> *The travel times for passengers that currently travel on the existing Fairfax Connector 980 service from Reston East (Wiehle Avenue) would be roughly similar to that of traveling by Metrorail from Wiehle Avenue Station to East Falls Church Station under the Wiehle Avenue Extension. For passengers that currently depart from Herndon-Monroe, it is expected that the travel time from Herndon-Monroe to East Falls Church would increase by approximately 2 minutes under the Wiehle Avenue Extension.*

Public Comment: Local officials must also make sure that the planning includes internal circulation systems that work with the transit stations. We also urge that a feeder system be strongly considered as an integral part of this. The stations must be considered and designed that future expansion of the feeder-bus access can be readily implemented. (0067 0075-3)

> ***Response:*** *An integral part of the project development will be the continued examination of the feeder bus systems serving specific stations. .*

Public Comment: Kiss & Ride drop-off points must be a part. Potential conflicts between feeder buses, cars and pedestrians must be minimized. Exclusive feeder-bus access lanes should be developed within at least a half a mile of station sites. (0067 0075-4)

> ***Response:*** *Comment Noted. The facility elements identified by the commenter have been considered in stations plans and will continue to be developed during preliminary engineering.*

Public Comment: In the future, some form of grade-separated internal shuttle bus, people-mover system, is possible in order to help provide quick access within these urban centers. (0067 0075-5)

> ***Response:*** *These types of improvements are not proposed as part of the Project and would be the responsibility of the local jurisdictions.*

Allow Express Service from Dulles Airport to Tysons Corner

Public Comment: Planning should also allow for express service between the Dulles Airport and Tysons Corner, thereby alleviating the conflict of rush-hour congestion and airport service. (0441, 0441-E –9)

> ***Response****: Express services between Dulles Airport and Tysons Corner was never a consideration among the alternative modes, their alignments and operating plans. The Locally Preferred Alternative is a Metrorail Extension with intermediate stations between Tysons Corner and Dulles Airport.*

Dulles Airport Growth Impacts

Public Comment: Impact of the Growth of Dulles International Airport (DIA) was not adequately documented nor was the impact of the anticipated passenger growth and commercial vehicular trips presented. It is recognized that the DIA represents an economic engine in the Dulles Corridor. Such economic engines have both a positive, as well as negative impact on the surrounding area. This impact needs to be documented and assessed. For example, the current projected passenger growth by the year 2020 may extrapolate to as many as 73.4K passengers per day transiting to and from DIA. Of that number, a portion may be expected to use a Dulles Corridor Rapid Transit facility (DCRTF). (See Attachment A.) (0427, 0427-E –3)

> ***Response****: The Project Team utilized a specific model that was developed during the original Dulles Corridor Transportation Study and refined for this Project for the forecast of Metrorail trips to and from Dulles Airport. Air passenger growth was factored into the forecasts. The model used was based on air passenger survey data collected at all three Washington airports by MWCOG and trips were estimated by all modes of arrival. The Dulles Airport forecasts are based on an extrapolation of the experience at National Airport because National Airport is the only regional airport with Metrorail access.*

Foster Transit-Oriented Development and Travel Demand Management

Public Comment: We need to assure that transit investments in the corridor will be accompanied by rapid investment to foster transit oriented development, walkable and bikeable neighborhoods around transit, high quality European and Japanese style bicycle access to transit throughout the corridor with Bikestations like those in California and bike paths leading to the stations, and appropriate incentives in the corridor that reduce the oversupply of free and subsidized car parking and encourage employer-provided transit benefits. (0444, 0444-E –7)

Public Comment: A wide variety of parking and travel demand management actions can and should be taken to foster transit use, reduce station area congestion, and achieve other private and public sector objectives related to transit development. Numerous examples of what can be achieved through such efforts exist around the country; however, there are few examples of success in Northern Virginia. Normally actions in these areas are left to the private sector or are limited to isolated public sector decisions, such as the establishment of one set of parking prices region wide by Metro. Fairfax County should take the lead in establishing a task force to investigate options for a more ambitious and comprehensive approach, involving community groups, property owners, major employers, and others. One particular component of a plan that should come out of such an effort is a set of rational parking prices in the station areas that would be designed to limit auto congestion in the station areas, assure the availability of some parking spaces at all hours, and create opportunities for the private sector to reduce its parking costs, reduce parking subsidies to employees, and create revenues from for-profit transit parking operations. Such parking prices and their impacts should be continually monitored to assure that these objectives are being achieved. (0478, 0484-E –17)

> ***Response****: Transportation demand management (TDM) is a useful tool for dealing with issues related to transportation, land use, economic development, and environmental quality in an urban context. TDM can be used to manage the transportation system better, which would increase*

mobility, and reduce pollution. TDM can also be used to mitigate negative consequences of development, most particularly increased traffic congestion and air pollution, while perhaps encouraging additional development to occur through the avoidance of traffic gridlock, if, when, and where TDM is implemented properly. Some employer-based TDM strategies, such as carpool/vanpool incentives, parking management, financial/time incentives, and information and marketing could also greatly reduce single occupant vehicle (SOV) traffic volumes.

The Fairfax Countywide Trails Plan and the Loudoun County Trails plan were consulted to determine future planned improvements to pedestrian and bicycle facilities. As part of the Project, pedestrian and vehicular access will be provided to each station from the nearest public rights-of-way. All other planned pedestrian and bicycle trails fall under the jurisdiction of the City of Falls Church, the Town of Herndon, Fairfax and Loudoun counties and VDOT. All stations would have bicycle racks and/or lockers adjacent to station entrances.

Potential Impacts of Telecommuting and Slug Commuting

Public Comment: How could technology - especially electronic technology, such as telecommuting - be used to reduce the need for travel in the corridor? (0235, 0235-E –4)

Public Comment: How could "non-traditional" transit such as the encouragement, and construction of parking, for "slug" commuting be used to reduce corridor travel? (0235, 0235-E –5)

Response: *Telecommuting can be used to reduce overall commuting and is promoted as an alternative to commuting. However, it would contribute only a fraction of the travel demand reduction needed within the Dulles Corridor to meet future commuting demands.*

Accommodate Intra-Reston Traffic

Public Comment: By 2005, we need to reserve aboveground for Reston, intra-Reston traffic to maintain our quality of life around the station areas. (0170, 0170-T –12)

Response: *Comment noted.*

Travel Demand Management Strategies Needed

Public Comment: Finally, I would like to point out that they say that transportation demand management strategies can make a significant difference. That's something Fairfax hasn't done very much of, but that will help mitigate the traffic congestion that will occur at the station areas. They include some recommendations in the plan, but they say once a Locally Preferred Alternative is selected, they will go back and develop far more detailed transportation demand management strategies. (0141, 0167-T –6)

Response: *Transportation demand management (TDM) is a useful tool for dealing with issues related to transportation, land use, economic development, and environmental quality in an urban context. TDM can be used to manage the transportation system better, which would increase mobility, and reduce pollution. TDM can also be used to mitigate negative consequences of development, particularly increased traffic congestion and air pollution, while perhaps encouraging additional development to occur through the avoidance of traffic gridlock, if, when, and where TDM is implemented properly. Some employer-based TDM strategies, such as carpool/vanpool incentives, parking management, financial/time incentives, and information and marketing could also greatly reduce single occupant vehicle (SOV) traffic volumes.*

Public Comment: How can the demand for transit along the corridor be reduced? (0235, 0235-E –2)

Response*: Demand for transit can be reduced by providing poorer service (less frequent service, less direct service), building residential and commercial areas at very low densities, and making access to transit difficult (i.e. no sidewalks, poorly designed and maintained bus stops, and poor*

access to park and ride lots). It should be strongly noted that this is contrary to every goal and objective of this project.

Better Headways on the Orange Line

Public Comment: The number of Blue line trains going to DC from Rosslyn needs to be decreased to allow better headway on the Orange line. (0043, 0043-CC-5)

Public Comment: The proposed routing of Dulles Rail trains on the Orange Line from East Falls Church to Stadium Armory seems wise & will increase the core capacity of the most used portion of the 103 mile Metrorail system. However, the re-routing of Blue Line trains to cross the Potomac near the 14th St. Bridge would sever the metrorail link between Rosslyn and the Pentagon. (0066, 0066-CC-4)

Response: *Re-routing of one-half of the Blue Line trains along the Yellow Line rather than through Rosslyn has been identified in the WMATA Core Capacity Study and Capital Improvement Plan as a possible means of increasing Orange Line service reliability but not frequency. This strategy has been incorporated into the Metrorail operating plans used to prepare the Final EIS.*

7.0 SECTION 4(f) EVALUATION

A. Draft EIS Comments

Regional Agency Comments

Impacts to the Washington and Old Dominion Railroad Regional Park

Regional Comment: As stated in the Draft EIS, the W&OD is a Section 6(f) protected property under the Land & Water Conservation Fund Act. In the early 1960's the federal government acquired an easement across the W&OD for the Toll Road overpass. However, rail uses do not appear to be included in the easement. Therefore, the Virginia Department of Conservation and Recreation has requested a determination from the National Park Service as to whether a conversion of use would be required for construction of an additional overpass for Metrorail within the easement area. To date, a determination has not been made by the National Park Service. Therefore, the Draft EIS should not state, "no conversion of Section 6(f) land would occur." Regardless of whether or not a conversion is required, the Park Authority must review and approve, in writing, any new construction within the easement. (0456, 0456-L –3)

> ***Response****: The Wiehle Avenue Extension will include a new three-span bridge structure over the Washington and Old Dominion Railroad Regional Park. In February 2004 the Virginia Department of Conservation and Recreation, after consultation with the National Park Service, made a determination that the proposed action would not result in a conversion of use under the Land & Water Conservation Fund Act because the Metrorail overpass will be within an existing transportation easement that includes highway overpasses for the DIAAH and Dulles Toll Road. A copy of this letter is located in Appendix K. DRPT will coordinate any construction activities in the vicinity of the Washington and Old Dominion Railroad Regional Park with the Northern Virginia Regional Park Authority.*

Public Comments

Impacts to the Washington and Old Dominion Railroad Regional Park

Public Comment: I understand that the draft environmental impact statement has ruled out transit stations at the Reston Town Center and at other locations outside the freeway median on the grounds that -- of impacts on the Washington and Old Dominion Trail. As a board member of the Friends of the W&OD Trail -- in fact, I was just patrolling the trail on my way over here -- I can't really see for the life of me why rail or bus transit couldn't overpass or underpass the W&OD Trail, just as the Dulles Access Toll Road does and the Reston Parkway, I-66, the Capital Beltway, and dozens of other transportation facilities. Of course, you know, you need to minimize park impacts, but it is certainly doable. (0066, 0254-T –3)

> ***Response:*** *The Wiehle Avenue Extension in the median of the DIAAH will include a new three-span bridge structure over the Washington and Old Dominion Railroad Regional Park. During the scoping process, there was a suggested alternative alignment that would have departed the DIAAH median and utilized the Railroad Regional Park. This alternative, known as Alignment D2, was eliminated from further consideration for the following reasons:*
>
> - *It was inconsistent with existing land use and future local and regional land use plans.*
> - *It would have required permanent use of the Railroad Regional Park, which is Section 4(f) resource. Alignment D1, which has become the LPA, provided a prudent and feasible alternative to Alignment D2 under the terms of Section 4(f).*

B. Supplemental Draft EIS Comments

No comments pertaining to this topic were received.

8.0 FINANCIAL ANALYSIS

8.1 Capital Funding Strategy

A. Draft EIS Comments

State Agency Comments

Need to Provide Maximum Value for Public Monies

State Comment: Furthermore, as a public official, I know we all share the interest that we get the maximum value for the public monies we spend. We don't want to in the short run simply be cheap. Cheap such that we make a solution today and we have to multiply that in the future. In the long run we have ended up spending more money, inconvenienced a number of people. We need to go forward with a working solution for the long run. (0131, 0163-T –5)

> ***Response:*** *Chapter 10 of the Final EIS (Evaluation of Alternatives Carried Forward) presents a comparative evaluation of the alternatives carried forward in the Final EIS. The intent of the evaluation is to demonstrate the relative effectiveness of the alternatives in meeting the stated goals and objectives, and to highlight the key differences between alternatives to facilitate the decision-making process.*

Public and Private Funding Sources

State Comment: Fortunately, there seems to be consensus that the necessary state, local and federal funding, along with substantial private funding, must be found to move the project to construction as soon as possible. Two important funding sources are within reach. Thanks to the initiative of the business community, LEADER has been created to help provide private funding. Governor Warner's leadership has put full funding for the local share before the voters this fall as a part of the sales tax referendum. (0012, 0468-L –1)

> ***Response****: The Project Team recognizes the important role that LEADER provided in the innovative financing mechanism for the Fairfax County capital funding share. The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*

Use of Innovative Pricing Strategies

State Comment: And finally, the final financial plan for using toll road revenues provides the opportunity to explore several innovative pricing strategies, including incentives to switch to the fast toll transponder to improve roadway capacity, high occupancy toll lanes, whereby single drivers can use the toll lanes for a price, the cost of which is determined by a pricing structure that controls congestion. (0131, 0131-T –11)

State Comment: The financial analysis in the plan should emphasize restructuring of the Dulles Toll Road to reduce congestion and enhance the vehicle throughput of the road thus increasing roadway capacity for drivers. Incentives should be provided to encourage more people to use transponders to enhance the capacity of the tollbooths, and to carpool and vanpool to enhance person throughput. The high occupancy vehicle lanes could be converted to a high occupancy toll lane to make better use of the lane to carry more people and more vehicles while using pricing to control congestion. This creative use of tolls would address some of the political concerns about the impact of increased taxes in Northern Virginia. (0131, 0434-E –6)

Response: *The Commonwealth of Virginia will consider the operation of its toll collection system when and if the tolls increase as part of the Project's capital funding plan. The availability of the HOV lane and the increased toll will assist to encourage ridesharing and carpooling. To operate as a true HOT lane, the current HOV lane would require separation from the HOV lane and the mixed-traffic toll plaza.*

Different pricing strategies and use of innovative technologies may be part of the long-range planning of the Commonwealth for the Dulles Toll Road. However, this aspect is outside of the scope of the Final EIS.

Need to Explore Equity Concerns

State Comment: It is completely inappropriate to increase tolls on the Dulles Toll Road to pay for the construction of rail. Commuters in the Corridor have been paying for the Dulles Toll Road for the past eighteen years. No other Virginians north of Richmond have been subjected to tolls. A typical commuter driving to work in D.C. from Reston fifty weeks a year is paying $375 each year. If that commuter has lived here for eighteen years, he has already paid $6750! In addition, these same commuters have paid for construction of the Metrorail system for the rest of the Washington Metropolitan area. (0298, 0298-L – 2)

State Comment: The proposals in the Draft EIS that would increase tolls either $0.50 or $0.25 in 2003 and then an additional $0.25 every three years until 2015 are neither fair nor equitable. As the Draft EIS demonstrates, the benefits of rail to Dulles are extensive and far-reaching, accruing to the entire metropolitan region and the state as a whole. To expect commuters paying increased tolls to generate between $725 and $800 million in funding for construction is unreasonable and simply wrong. These ill-conceived proposals to raise tolls should be discarded immediately. Fortunately, there is an alternative. A portion of the undesignated funds that will be generated if the transportation referendum passes could be earmarked for this purpose. (0298, 0298-L –3)

Response*: The basis for funding extensions to the existing Metrorail system, such as the Dulles Corridor Rapid Transit Project, is stated in the WMATA Board of Directors Resolution #2000-35 extension resolution: "All design, engineering, construction and financing costs of an Extension, including revenue vehicles and required facilities and equipment, which is added to the Adopted Regional System (ARS), including costs associated with delay in receipt of federal funding and extraordinary costs, would be funded by the jurisdiction in which the Extension is located with local, state, federal and other funds, without cost to the other Compact member jurisdictions." The Dulles Corridor Rapid Transit Project would be considered an "Extension to the Adopted Regional System," and therefore the WMATA compact member jurisdiction (in this case, the Commonwealth of Virginia) would be responsible for providing the required non-Federal funding for the project. The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project's capital funding.*

For the Wiehle Avenue Extension, the Commonwealth is considering a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza. This modest increase is expected to provide sufficient revenues to meet the Commonwealth's obligations for the Extension.

To fund construction of the remainder of the Full LPA, the Commonwealth may consider other sources, including transportation appropriations, in addition to the Dulles Toll Road revenues. Chapter 8 of the Final EIS also describes the financial participation of Fairfax and Loudoun counties, and the Metropolitan Washington Airports Authority in the Full LPA funding.

Consider Costs of Obtaining and Maintaining Environmental Permits

State Comment: NRO is unable to assess whether the cost of obtaining and maintaining environmental permits is addressed in the Operations & Maintenance costs estimates. Permit application fees were

raised as of July 1, 2002. Similarly, it is unclear if the possibility of paying for the cost of permit-driven sampling and analysis has been considered in estimates. Most VPDES permits require flow estimates and analysis for a variety of parameters, based on the activities conducted at a site and the reasonable potential for the discharge of pollutants. (0407, 0407-A –37)

> ***Response****: The cost of obtaining environmental permits for construction is contained within the capital cost estimate. The model for the estimate of operating and maintenance costs generates an estimate that contains the cost of environmental permits, but the model does not have a specific cost drive for such, since the cost is negligible in comparison to the drivers.*

Need to Address Currency Formatting

State Comment: Pg. 8-3: Table 8.2-2 - suggest adding: in $ million (0421, 0421-A –21)

> ***Response:*** *The capital cost tables of Chapter 8 of the Final EIS contain in their titles the phrase '(Millions YOE Dollars)'. The acronym 'YOE' represents Year-of-Expenditure and signifies that the costs have been inflated.*

Potential Local Funding Sources

State Comment: Fortunately, there seems to be consensus that the necessary state, local and federal funding, along with substantial private funding, must be found to move the project to construction as soon as possible. Two important funding sources are within reach. Thanks to the initiative of the business community, LEADER has been created to help provide private funding. Governor Warner's leadership has put full funding for the local share before the voters this fall as a part of the sales tax referendum. (0012, 0468-L –1)

> ***Response****: The Project Team recognizes the important role that LEADER provided in the innovative financing mechanism for the Fairfax County capital funding share. The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*

Regional Agency Comments

Need for Further Explanation of Capital Costs

Regional Comment: The capital costs in the Draft EIS do not reflect earlier professional estimates. The original MIS completed in 1996 estimated $1.4 billion to build rail from the Orange Line though the Dulles Corridor to Loudoun County with three stops at Tysons Corner and part of the Tysons Corner section underground. Guesstimates given by knowledgeable people to the Dulles Corridor Task Force were of the order of $1.8 billion to $2.2 billion. Good civil engineers typically know within about 10% to 15% what a project will cost, particularly when it is an extrapolation of existing work, as is the case here. A 15% contingency on a $2.2 billion project would bring the projected cost to $2.53 billion. Another $615 million has been added in the Draft EIS as "soft costs." These "soft costs" reflect a 27% increase in the $2.2 billion estimate. (0133, 0405- L-15)

> ***Response****: The increase in the capital cost estimate of the Full LPA from the MIS Supplement is due to escalation to year-of-expenditure dollars, increased project scope, increased land acquisition, increased soft costs, and greater design detail. The capital cost estimate was prepared independently of the MIS estimate. The level of soft costs within the capital cost estimate is within the industry norm for design and construction of a large civil project.*

Need to Define Project Cost Controls

Regional Comment: Frankly, it will be difficult to justify $3 billion plus for the Dulles Corridor Rail when the DEIS, in comparison to the highway baseline offers: No timesaving; No air quality improvement; No reduction in energy consumption; Recovers only 38% of O&M from the fare box compared to 70% plus for the existing rail system. Requested Action: Refine and justify the projected capital cost for the locally preferred alternative; Define the cost controls that will be put in place by Virginia to avoid further cost escalation. (0133, 0405- L-16)

> ***Response****: The capital cost estimates of the two Build Alternatives of the Final EIS will be updated during the Project's preliminary engineering phase, which is now commencing. Those estimates will serve as the basis for the negotiation of the Federal Full Funding Grant Agreement. Cost controls in addition to the estimating process to date will include a value planning process, a value engineering process, risk analysis, the use of design-build procurement through the Virginia Public-Private Transportation Act, and continued use of project contingencies to account for design unknowns.*

Local Agency Comments

Passage of Transportation Referendum Critical to Project's Success

Local Comment: Integral to any public project of this size is an intelligent and practical funding plan. For Fairfax County, the funding pieces have come together in an unprecedented way; we are now uniquely positioned to capitalize on new, dedicated funding sources that will reduce or replace the County's local contribution. The November transportation referendum includes $350 million specifically for the Dulles corridor transit project: its passage is critical for the success of the project. That funding coupled with the revenues from the proposed special tax district will fund most of the local share. (0130, 0289-L –2)

Local Comment: Integral to any public project of this size is an intelligent and practical funding plan. For Fairfax County, the funding pieces that have come together are coming together in an unprecedented way. We are now uniquely positioned to capitalize on new and dedicated funding sources that will reduce or replace our kind of use, and the transportation referendum includes $350 million specifically for this project. Its passage, in my opinion, is critical for the success of the project. That funding, coupled with the revenues from the proposed special tax district, will give Fairfax County our local share. (0130, 0130-T –2)

> ***Response:*** *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*

Implement A Plan to Avoid Funding Delays

Local Comment: Loudoun County stands ready to support its share of this project financially and has a funding mechanism to accomplish this. We are concerned that other funding may not be available on the originally proposed schedule and strongly urge that all means necessary be taken to put a funding plan in place that will deliver this project on its current schedule. This project is too important to allow it to be delayed. (0240, 0240-T –2)

> ***Response:*** *The Project Team recognizes the significant financial commitment that Loudoun County has made to the Project and the need to maintain the Project schedule.*

Sales Tax Referendum is not a "Required" Element

Local Comment: Finally, we would like to note for the record that the proposed Virginia sales tax referendum does not incorporate the Dulles Corridor Rapid Transit Project and this project has a separate

funding mechanism. In other words, the sales tax referendum should not be held up as a required element in order to financially realize this project. This fact has been publicly noted by some of our local officials, and we want to emphasize this important point again. (0233, 0426-M –44)

> ***Response:*** *The commenter is correct in stating that the Project's Financial Analysis in the Draft EIS did not include the then sales tax referendum as a funding source, but did acknowledge that it was a potential additional source that could have offset some of the proposed local funding sources. The capital funding strategy for the Full LPA also requires contributions from MWAA and Loudoun County, neither of which is currently proposing sales tax revenues or special tax districts.*

Need for Detailed Explanation of Funding Mechanisms

Local Comment: Every session has included statements that "the funding mechanisms are in place for funding of the rail system", however, no one ever goes into detail of what those funding mechanisms are. (0233, 0426-M –11)

> ***Response****: Chapter 8 of Final EIS identifies the capital cost funding mechanisms proposed for each jurisdiction. The specific funding instruments, timing and amounts are still subject to final agreements that DRPT, the project sponsor, will negotiate and execute prior the Project's Federal Full Funding Grant Agreement.*

Need for Further Explanation of Subsidies

Local Comment: Who pays for the subsidies that are going to be necessary for each ride taken on the rail (you have either heard or will hear about the subsidies that will be necessary for rail ridership (some have estimated that subsidy to be $26.00 per ride…some say higher). (0233, 0426-M –15)

> ***Response****: The WMATA Compact jurisdictions would pay the annual subsidy of the Project. Chapter 8 of the Final EIS lists the operating costs, revenues, subsidy and the subsidy allocation among the Compact jurisdictions for the Wiehle Avenue Extension and Full LPA In opening year and forecast year.*

Need Further Explanation of Federal Contribution Payments

Local Comment: There are two rumors floating around town (mind you I said they are rumors but I think they beg some answers if for no other reason than to stop them…if they are rumors): That the federal government's portion of the financing for rail will not come (if it comes) in a lump sum, but in appropriations over more than a fifteen year period. Gee, how does this rail thing get financed now, at what long term financing cost and at whose expense? (0233, 0426-M –19)

> ***Response****: The Project would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. As documented in the Final EIS, the first phase of 11.6 miles would commence from a seamless connection with the existing Orange Line near West Falls Church, serve Tysons Corner and reach Reston at Wiehle Avenue. It is anticipated that this first phase, named the Wiehle Avenue Extension, would begin operations in 2011. The second phase of 11.5 miles would continue westward from Wiehle Avenue and serve Reston, Herndon, Dulles Airport and eastern Loudoun County by year 2015. Thus, the period of time of all capital funding would be fourteen years, from fiscal year 2004 through 2017. The capital funding strategy in Chapter 8 of the Final EIS does not include the cost of financing for the Full LPA, since the Federal government is currently advancing only the Wiehle Avenue Extension in its New Starts program.*

Need to Address Equity Concerns

Local Comment: Too much State and County funding is coming from the Corridor itself. The benefits are shared throughout the region and the state, and funding must be equitable. (0233, 0426-M –5)

> ***Response****: The capital cost amounts and percentages shown in Chapter 8 of the Final EIS are based on a preliminary agreement among the funding partners. The capital funding strategy in Chapter 8 derives from the WMATA Board of Directors Resolution #2000-35 stating that "All design, engineering, construction and financing cost of an Extension, including revenue vehicles and required facilities and equipment, which is added to the Adopted Regional System (ARS), including costs associated with delay in receipt of federal funding and extraordinary costs, would be funded by the jurisdiction in which the Extension is located with local, state, federal and other funds, without cost to other Compact member jurisdictions." In this case, the responsible WMATA compact jurisdiction is the Commonwealth of Virginia. The incremental annual subsidy of the Project's operating and maintenance costs is allocated among the WMATA Compact jurisdictions (Virginia, Washington D.C. and Maryland), based on the WMATA subsidy allocation formula outlined in Chapter 8 of the Final EIS.*

Local Comment: Doubling the current Dulles Access Toll Road toll to pay for rail rapid transit is unfair since the project will provide no direct benefits to residents of McLean and the indirect benefits, additional commuting capacity, is probably at least ten years away. (0233, 0426-M –26)

> ***Response:*** *The Commonwealth of Virginia will be responsible for 25 percent of the Project's capital costs. For the Wiehle Avenue Extension, the Commonwealth will use revenues from the Virginia Transportation Act of 2000 and Dulles Toll Road revenues. A planned toll increase would raise tolls at the main toll plaza to $0.75 and at each ramp toll plaza to$0.50. For the Full LPA, in addition to the two sources of the Wiehle Avenue Extension, the Commonwealth may consider other sources, including future transportation appropriations.*

Need Further Explanation of Public-Private Partnership Option

Local Comment: A project based on finding money that plainly is not going to be appropriated is not a solution to transportation in the Dulles corridor. Neither is a secret public-private partnership option, the details of which are negotiated without meaningful citizen involvement, but stick the taxpayers with increased payments, in this case higher tolls on the Dulles Toll Road. (0151, 0151-T –3)

Local Comment: A project based on finding money that plainly will never be appropriated is not a solution to transportation in the Dulles Corridor. (0151, 0297-E –3)

> ***Response:*** *The Public-Private Transportation Act (PPTA) requirements are contained in the 1995 legislation, as amended. 1995. The status of the PPTA consortium is described DRPT's web site, www.drpt.virginia.gov.*

Need to Explore Impacts of Increased Tolls

Local Comment: Could it be that no one pushing rail wants to talk very much about the additional toll increases that will be necessary "forever" to pay for rail??? $2.00 in each direction. Conversations I have had with many people on this subject have stated they will avoid the toll road if tolls go up (they can't afford more costs). That means more traffic on alternate routes…they very thing you are trying to stop. (0233, 0426-M –13)

> ***Response:*** *As described in Chapter 8 of the Final EIS, the Commonwealth of Virginia will be responsible for 25 percent of the Project's capital costs. For the Wiehle Avenue Extension, the Commonwealth will use revenues from the Virginia Transportation Act of 2000 and Dulles Toll Road revenues. A planned toll increase would raise tolls at the main toll plaza to $0.75 and at each ramp toll plaza to $0.50. For the Full LPA, in addition to the two sources of the Wiehle*

Avenue Extension, the Commonwealth may consider other sources, including future transportation appropriations.

Need to Remove Increased Tolls from the Financial Analysis

Local Comment: Urge Virginia Department of Public Rail and Transportation to remove from the financial analysis the increased tolls, at least until the construction of the earliest phase of the project. (0437, 0437-E –8)

***Response**: As described in Chapter 8 of the Final EIS, the Commonwealth of Virginia will be responsible for 25 percent of the Project's capital costs. For the Wiehle Avenue Extension, the Commonwealth will use revenues from the Virginia Transportation Act of 2000 and Dulles Toll Road revenues. A planned toll increase would raise tolls at the main toll plaza to $0.75 and at each ramp toll plaza to$0.50. In addition to the two sources of the Wiehle Avenue Extension, the Commonwealth may consider other sources, including future transportation appropriations. Any approved toll increases would be implemented in advance of construction to begin building reserves for the Project, perhaps as early as January 2005.*

Need for Further Explanation of Project Costs

Local Comment: The overarching problem is cost. $3.2 billion is simply unacceptable. Our independent experts are perplexed at this price tag for this project. The project should cost half this amount at most. The current cost projection is a red flag demonstrating that the whole project needs to be subjected to serious reexamination. We are heading for a train wreck of massive proportions if we launch this project with these inflated projections, knowing full well that the cost is going to escalate further as time goes by. (0151, 0151-T –2)

Local Comment: The overarching problem is cost. $3.6 billion is simply unacceptable. Our independent experts are perplexed at this price tag for this project. The project should half this amount at most. The current cost projection is a red flag demonstrating that the whole project needs to be subjected to serious re-examination. Those figures tell us in clear terms that we are NOT at one stage and need to focus on moving to the next. Those figures tell us that we need to go back and look at previous stages to find out what's already off the track. We are headed for a train wreck of massive proportions if we launch this project with these inflated projections, knowing full well that the cost is going to escalate further as time goes by. (0151, 0297-E –2)

***Response:** The project's capital cost estimates are comparable with projects of this size and are based on a methodology appropriate with the design stage of the Final EIS and the final General Plans. It should be noted that the medians of the Dulles Connector Road, Dulles Toll Road, and Dulles Greenway were reserved for high-capacity transit, saving the project significant money for right-of-way and access. The next phase of the project, preliminary engineering, will prepare an independent estimate of the capital costs of the two Build Alternatives.*

Description of Local Jurisdictions' Funding Plans

Local Comment: This is in response to your request for information and an update of the local jurisdictions' funding plans for the Dulles Corridor Rapid Transit Project (Project). I understand that other funding partners will also be providing information specific to their portion of the project cost. At the request of the Fairfax County Board of Supervisors, the Virginia General Assembly approved legislation in 2001 to allow the creation of a special transportation improvement district in the Dulles Corridor to help fund the County's portion of the Project. The landowners' group, Landowners' Economic Alliance for the Dulles Extension of Rail (LEADER), has been formed to push for the establishment of the tax district in the corridor. In addition to the transportation improvement district and county general obligation bonds, another possible revenue source is the upcoming transportation referendum this fall. The Board has endorsed the Transportation Sales Tax Referendum to increase the sales tax rate by one-half percent to fund important transportation projects in the region. In the list of projects to be funded by the sales tax

revenue, the Dulles Corridor Rapid Transit Project is prominently featured with $350 million set aside for the Project, to be used for the locality share of the project capital cost. (0233, 0233-L –1)

Response: *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share. The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding.*

Need to Explore Innovative Pricing Strategies

Local Comment: As the financial plan for the project is finalized, we suggest the Project Team consider Dulles Toll Road revenues to provide incentives for using the Fastoll transponder instead of paying cash; provide discounts for carpool and van pool drivers, and provide a demonstration of the high occupancy toll or HOT lane concept, which uses variable tolls to regulate use of the HOT lane. (0233, 0426-M –35)

Local Comment: What about paying for use of HOV lanes by those with LOV vehicles? Works great in LA. (0233, 0426-M –22)

Response: *The Commonwealth of Virginia will consider the operation of its toll collection system when and if the tolls increase as part of the Project's capital funding plan. The availability of the HOV lane and the increased toll will assist to encourage ridesharing and carpooling. To operate as a true HOT lane, the current HOV lane would require separation from the HOV lane and the mixed-traffic toll plaza.*

Need Further Explanation on Tax District Boundaries and Rates

Local Comment: But the only way this ever gets to a conclusion is if the local group takes initiative that was actually started by the Board with legislation that was passed by the General Assembly and welcome back to you next time and this effort…Governor Holton and I are pleased to serve as Co-Chairs…. and present you with a petition. Which would….according to the law that was passed by the General Assembly and was in effect suggested mandated by this Board some time early next year after this process has been completed locally preferred alternative has been selected. And we'll come back to you at that point with a specific proposal as to what the particular boundaries of any tax district that might be created to fund such a project might be, and what the particular tax rate (this might be a district, it might be districts) but those decisions won't be made until after this part of the process has been completed. (0233, 0426-M –1)

Local Comment: Could it be that no one pushing rail wants to talk about raising the taxes on the commercial property by an additional .30 to .50 centers per $100 dollars of value?????? Is that good for my business??? The answer is NO!!! I will have to charge more for rent to keep up with taxes at a time when there is more vacancy in the corridor (and at Tysons) then there was during the early 90's. Some experts say the corridor recovery could take as long as 3 to 5 years (I hope not) but…now is not the time to raise my taxes. (0233, 0426-M –12)

Response*: Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. Although payments will not be due until December 2004, on July 1, 2004, Fairfax County began charging commercial landowners an additional 22 cents per $100 of assessed value for their properties on top of the base real estate tax rate of $1.13. Fairfax County projects that the tax rate could eventually increase to 29 cents per $100 of assessed value once a Full Funding Grant Agreement is executed. The actual levy will be established each year based on current assessments and the amount of outstanding debt. The district, which had an assessed value of $6.8 billion in June 2004, is expected to generate up to $400 million for the construction of the Wiehle Avenue Extension.*

Need Explanation on Source of Funding for Maintenance Costs

Local Comment: Could it be that no one is pushing rail wants to talk about the additional taxes that will have to be raised from private citizens and businesses to pay for the annual estimated $125,000 to $185,000 in maintenance costs for rail…do you think businesses…which are already hurting because of the downturn in this economy are going to be pleased to get additional tax bills for rail which most of their employees won't use? (0233, 0426-M –14)

> ***Response****: The incremental annual subsidy of the Project's operating and maintenance costs is allocated among the WMATA Compact jurisdictions (Virginia, Washington D.C. and Maryland), based on the WMATA allocation formula. As presented in Section 8.2 of the Final EIS, the incremental annual subsidy of the Wiehle Avenue Extension in its opening year of 2011 is $20 million in year-of-expenditure dollars. Of this subsidy amount, the Fairfax County share is $7.5 million. There are no plans for the Transportation Improvement District revenues to be used for operation and maintenance subsidy assistance.*

Need for Cooperative Funding Approach

Local Comment: The Town of Herndon supports federal, state and local officials working together to achieve full funding for the Metrorail Alternative from federal, state and local sources. (0409, 0409-L –5)

> ***Response:*** *Comment noted.*

Public Comments

Need Further Explanation on Average Cost Per Rider

Public Comment: Because the ridership estimates are inflated, the average cost per rider also is suspect. (0112, 0462-L-7)

> ***Response:*** *The ridership estimates are based on the Metropolitan Washington Council of Governments' Round 6.3 cooperative land use forecasts of the region. This travel demand forecast model of the Final EIS contains these land use forecasts and mechanisms for estimating roadway and transit ridership with and without the Dulles project.*

Need Further Explanation on Subsidy Costs Per Rider

Public Comment: Very few people are projected to use Amtrak to Dulles in spite of the outrageous costs that are projected, initial costs that are probably twice what it should cost to do either rail or Bus Rapid Transit, and crippling annual subsidies for the rest of our lives. (0162, 0162-M-5)

Public Comment: The reason Virginia has out competed Maryland for commercial development is simply the fact that Virginia has been a lower tax environment overall, an advantage which the proponents of this public-private partnership are threatening. The actual numbers for rail confirm what we at Dartrail suspected 15 years ago: a subsidy of $40 per ride, equivalent to an annual subsidy per taxpayer in Fairfax of $400 per year, for the indefinite future. These annual subsidies assume that $3.3 billion is magically available for this project - and we know the money is not there. (0162, 0162-M-8)

Public Comment: So those of you in the political sphere that are thinking of voting for rail now, just remember every time people pay for the Toll Road, they pay sales tax, and they pay the property taxes, they are paying for something that is of no extra benefit. It amounts to a $40-per-ride subsidy, which is obviously way too high. (0184, 0184-T –7)

Public Comment: In looking at your numbers and ridership on the rail, we're guesstimating by your numbers that there will have to be a subsidy per ride of $43 per subsidy ride on the rail, as opposed to

BRT. The reason we got to that is you look at the metro system in Washington now currently and has always run in a deficit position and has currently gone back for additional funding. (0252, 0252-T –3)

Public Comment: We also believe that in looking at your numbers again that there is going to have to be an additional subsidy of somewhere between 110 and 185 million dollars per year in subsidies for maintenance on the system. Where does that money come from? (0252, 0252-T –5)

> ***Response:*** *The Federal Transit Administration has established two cost-effectiveness measures as part of its equitable evaluation of New Starts projects. As presented in Section 10.2 in the Final EIS, for the Wiehle Avenue Extension in year 2025 in comparison to the New Starts Baseline, the cost per new transit trip is $24.73 and the cost per user benefit hour is $18.69 to $21.08.*

Need Further Explanation on Committed Federal Funds

Public Comment: I want to understand how much federal money is committed to this project, and have some idea whether it is likely to be forthcoming. If it is likely to be cut, what is our plan to replace these funds? (This question is why I copied Rep. Tom Davis). (0114, 0114-E –6)

> ***Response:*** *As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A total of $163.5 million in Federal New Starts funding has been appropriated for the Project through fiscal 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and timing of federal funding participation, will be finalized following completion of preliminary engineering activities.*

Need Further Explanation on Sales Tax Increase

Public Comment: Their entire project should be on hold until we see how the people vote re the sales tax increase. (0006, 0006-L –2)

Public Comment: I think this project is vital to improved economic health in the Dulles Corridor. But I (and my fellow voters) need to be shown that the sales tax increase will get us there. (0114, 0114-E –8)

Public Comment: I want to have enough plans in place, and publicly available (with an "executive summary" that we normal MBAs can read) so that I can have confidence that the organizations in place can make it happen. If that means requiring VDOT to have their budgets, estimates and schedules reviewed by someone with a better planning track record, then please get that review done before I vote on the tax. (0114, 0114-E –4)

> ***Response:*** *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*

Need Further Explanation on Transportation Improvement Districts

Public Comment: Most of the burden should be borne by major employers in Tysons who import the workers. (0049, 0049-CC-2)

> ***Response:*** *Section 8.1of the Final EIS describes the creation of the Fairfax County Dulles Rail*

Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. Although payments will not be due until December 2004, on July 1, 2004, Fairfax County began charging commercial landowners an additional 22 cents per $100 of assessed value for their properties on top of the base real estate tax rate of $1.13. Fairfax County projects that the tax rate could eventually increase to 29 cents per $100 of assessed value once a Full Funding Grant Agreement is executed. Most of the commercial landownership of the district is in Tysons Corner.

Need to Explore Equity Concerns

Public Comment: Residents in Tysons should not be taxed to subsidize the cost of commuters. Many commuters are from MD. How long before rail is available along the beltway to service them & reduce such congestion. (0049, 0049-CC-1)

Response: *The Dulles Rail Transportation Improvement District does not apply to owner-occupied residential properties in the Tysons area, or anywhere else along the corridor. Other proposed funding sources, including the revenues from the Dulles Toll Road, would not be specific to Tysons residents, and would apply to Maryland commuters and visitors. Rail along the Capital Beltway to connect Maryland and Virginia is not yet programmed project.*

Need Explanation on Allowable uses of Tax Increase Funds

Public Comment: I want to know that the money I'm voting to pay will be spent for this purpose. No more "it may be used by other road projects." Other projects are fine, but for me this is the most important, and if I'm not confident it will happen, I can't support increased taxes. (0114, 0114-E –5)

Response: *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the project's financial analysis would have been updated accordingly.*

Need Explanation on Tax Increase Level

Public Comment: Increases sales tax 1% to help transportation funding in the NOVA region. Compared to other major metropolitan areas (NY, Chgo, LA) who are all ~7.5%, VA is unusually low. (0079, 0079-CC-3)

Response: *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*

Need Further Explanation of Contributions by Jurisdiction

Public Comment: Dulles Airport must contribute more money to rail option. (0092, 0092-CC-2)

Public Comment: The cost -- the Airports Authority I don't think is kicking in enough. I saw in the paper 134 million versus 152 million for Loudoun County residents, yet about 4500 of the riders are going to come from Dulles airport, which is not far ahead of the 3800 for BRT. And once again, BRT is just much cheaper. (0112, 0245-T –9)

Response: *The project does benefit from the Metropolitan Washington Airports Authority proffer of the median of the Dulles International Airport Access Highway and Connector Road for Metrorail right-of-way at no cost to the Project. The amount and percentage of capital funding of the two Build Alternatives by jurisdiction are based on the preliminary allocation agreement among the non-federal funding partners.*

Need Funding Plan to Address Shortfalls

Public Comment: A more fundamental problem is the funding plan. There is no firm assurance that there will be a tax district to help in funding. The beneficiaries of the new system must provide adequate support. The specific contribution must be established. Based on the experience with the Route 28 Tax District (where VDOT was required to use funds from other Northern Virginia projects to cover the Districts shortfall in debt servicing). The sales tax increase in not ensured, the Federal contribution is not established, from a toll increase on the toll to help provide state support has many opponents. With cost increase examples of the Wilson Bridge and the Mixing Bowl interchange, it is very likely that the stated costs are understated. Specific plans should be advanced to cover this contingency because of the multiple agencies contributing to any finally approved project. (0119, 0119-L –3)

> ***Response:*** *Chapter 8 of the Final EIS presents the capital cost estimate and funding strategy for the two Build Alternatives. The estimates include a change order contingency, a design allowance, a complexity factor and inflation to year of expenditure. DRPT will prepare a final financial plan and risk assessment during the project's next phase, preliminary engineering.*

Need to Explore "More Equitable" Source of Funding

Public Comment: If there are insufficient funds "up front", Virginia Railway Express has proven that transit revenue bonds can be sold at favorable rates with no guarantees other than bond insurance against fraud. Fare revenues will support a bond issue of about $600 million. (Metrorail did get a letter of credit from local banks for $600 million to fund the construction of the final segments of the Green Line but by the time construction was completed, grant funds had become available to fully fund the completed project without drawing on the letter of credit). This is a more equitable source of funding than a tax district where abutting property owners would be double taxed for the project, once by the tax district and once by the appreciated property values. Over the life of the project, MetroRail will save more than it costs, for sure. (0013, 0013-L –29)

> ***Response:*** *Since the Metrorail system and any Metrorail extension operates at a deficit, there are no excess fare revenues for capital financing. Section 8.1 of the Final EIS describes the successful creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of capital costs for the Extension.*

Need for Public Distribution of Sales Tax Increase Details

Public Comment: I would like to say that I will vote for the sales tax increase for transportation in Northern Virginia. And I hope I'll be able to do so, I really do! However, I hope that before the election day you'll be able to provide me with enough credible information and plans that it makes sense. I'm sure many of my fellow Northern Virginians are in the same boat so hopefully you'll take my list seriously. (0114, 0114-E –1)

> ***Response:*** *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*

Need for "What-If" Scenarios in the Financial Analysis

Public Comment: How can we afford their Rail with surprise deficits and other problems in Virginia, as mentioned in newspapers. (0006, 0236-L –2)

Public Comment: What about the - what happens if the Federal funding doesn't come forward? The metrorail requires that the Congress put up $200 million a year for the project, and yet our congressmen,

Wolf and Moran, have both warned that it is unlikely that even half that amount is going to be available. And that was before the war on terrorism, homeland security program, and the rapid increase in the national debt began to take so much of the money that will be necessary. (0138, 0241-T –10)

> ***Response:*** *The Project would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A total of $163.5 million in Federal New Starts funding has been appropriated for the Project through Fiscal Year 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and timing of federal funding participation, will be finalized following completion of preliminary engineering.*

Need for Further Development of Financial Plan

Public Comment: The next thing we are really concerned about is the financial plan. The financial plan for this $3.3 billion undertaking is extremely short. It's just 24 pages out of 3000 pages total in the EIS, attempting to cover all of the following: The design and construction costs; capital funding issues; subsidy requirements; and financial risk management. And you're doing it for five alternatives, which - with a bunch of sub alternatives. We believe that this level of analysis is grossly inadequate for such a massive undertaking in such uncertain times. (0138, 0241-T –8)

Public Comment: WMATA's financial plan is incredibly speculative. The DEIS devotes only 24 pages in a 3,000 page study to cover all of the following: design and construction costs, capital funding, subsidy requirements, and financial risk management. That is grossly inadequate, especially since there are so many variations being considered. (0112, 0462-L –31)

> ***Response:*** *The financial analysis presented in the Final EIS summarizes the estimates of capital costs, operation and maintenance costs, revenues, and subsidy allocation for the two Build Alternatives. NEPA requires the environmental impact statements to succinctly describe the data and analyses used to understand the effects of the alternatives. In this case, it is a summary of the estimated costs and proposed funding sources. DRPT prepared a preliminary financial plan for the Wiehle Avenue Extension as part of its Request to Enter Preliminary Engineering (August 2003), and will prepare the final financial plan for that extension during preliminary engineering.*

Public Comment: All of the money - local, state, and Federal - dedicated to this project will be money that cannot be spent on other transportation projects; and, This project stands the likelihood of being the first, or among the first, in the nation ever to be presented to the Federal Transit Administration as a candidate for a Full Funding Grant Agreement with its local and state funding plans in place. (0154, 0225-M –9)

Public Comment: All of the money, local, state and Federal, dedicated to the project will be money that cannot be spent on other transportation projects. This project stands the likelihood of being the first in the nation ever to be presented to the Federal Transit Administration as a candidate for a full funding grant agreement with its local and state funding plans in place, thus enhancing its standing in the competition for federal funds. In the mind of LEADER's cochairman and board of directors, the huge environmental, social, and economic benefits of building Dulles rail now makes the project vital and the role of LEADER critical. (0154, 0182-T –5)

Public Comment: During the FEIS and rail PE process we need hard work on…Development of a plan

for funding these and other improvements from the economic growth that will occur. (0173, 0213-M –11)

Response: *DRPT prepared a preliminary financial plan for the Wiehle Avenue Extension as part of its Request to Enter Preliminary Engineering (August 2003) and will prepare the final financial plan for that extension during preliminary engineering.*

The Project Team recognizes the important role LEADER had in forming the Transportation Improvement District and in meeting the federal requirement to secure local funding in advance of federal commitment.

Need Further Explanation of Federal Funding

Public Comment: Moreover, there is no money to build the Dulles Expansion. The federal government did not even have enough money to replace the Woodrow Wilson Bridge, which it owns. It will have even less money in 2010 when social security costs will begin to exceed social security tax revenues. (0140, 0200-E –2), (0140, 0140-T-2)

Response: *The Federal funds for the Dulles Corridor Rapid Transit Project will come from Federal New Starts program. The Woodrow Wilson Highway Bridge is not eligible to compete for these funds. How the Federal government will address its budget needs in the context of Social Security funding is beyond the scope of the Final EIS.*

Need Further Explanation on State Funding

Public Comment: The state of VA has no money for the Metrorail expansion. It cannot even pay for overdue road improvements. There are no plans to increase the state's transportation revenue stream. The transportation fund is what the state raids to pay for schools and welfare during economic slowdowns. Transportation is government's lowest priority. (0140, 0200-E –3), (0140, 0140-T-3)

Public Comment: Believes that the response on page 366 of the *Public Hearings Report* is based on a misunderstanding of their recommendation because the opening phrase ("If these recommendations are accepted…") of their actual recommendation was omitted from the comment on page 365. They recommended a funding scenario that involves several toll increases, beginning about 2006, which would raise an estimated amount of bond revenue in excess of a half billion dollars. (0494 08)

Response: *The Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act (VTA) of 2000 and Dulles Toll Road revenues.*

To fund the Commonwealth's share of the Dulles Corridor Rapid Transit Project with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations for the Wiehle Avenue Extension.

Need Further Explanation on Sales Tax Referendum

Public Comment: The $5 billion in bond revenues that tax-referendum supporters cite is fraudulent. An annual revenue stream of $140M can support only $1.4 billion of bonds. Perhaps in another 10 years, another $1 billion could be floated, for a maximum of $2.4 billion. The remainder of the $5 billion would be paid for by our grandchildren. (0140, 0200-E –5)

Response: *The sales tax referendum of Fall 2002 did not pass; it would have has allocated a minimum of $350 million for Dulles as part of the Fairfax and Loudoun County local shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly to reflect the sales tax referendum funds.*

Public Comment: I think the cost to the taxpayers is really abominable. I really can't understand how members of the Loudoun supervisors and their financial backers and the Piedmont Environmental Council and other environmental groups can oppose the sales tax referendum, which is going to cost about $90 a year to the average family, but these rail transit proposals will cost each commuter, by my estimate, about $480 to $500 a year. Because if you work 240 days out of the year and you've got to pay $2 more each day, just do the math. (0112, 0245-T –8)

Response: *Additional sources of revenue for the project beyond the use of the Dulles Toll Road revenues will be examined by the Commonwealth through the development of a preliminary financial plan for the remainder of the Full LPA.*

Need Further Explanation of Transportation Revenue Sources

Public Comment: The solution of building the Dulles Metrorail? And all other transportation improvements? Is to defeat the tax referendum and force government to let transportation compete with ineffective school and welfare programs for real estate and income tax revenues. (0140, 0200-E –7)

Public Comment: This year the [Fairfax] County is getting $270 million more than it would have if residential taxes had increased no faster than inflation. Where is the money going? It is going to public schools and welfare. There has been no significant increase in academic achievement in our schools, and our growing welfare spending is teaching citizens to depend on government handouts rather than to become self-sustaining. The basic problem is that state policy forbids the spending of income taxes on transportation. None of your state income taxes are spent on transportation. And county policy does not allow spending real estate taxes on transportation. These big buck revenue streams are off limits to transportation, they are monopolized by education and welfare, whose programs subsidize problems rather than solve them. The solution to building the Dulles metrorail and all other transportation improvements is to defeat the sales tax referendum and force government to let transportation compete with ineffective school and welfare programs for real estate and income tax revenues. (0140, 0140-T –7)

Response: *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share. The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding.*

Need for "Third Party" Review of Cost Assessment

Public Comment: The DEIS envisions a 50% federal commitment or about $1.7 billion. However, the federal government won't commit to any percentage, only a dollar amount. If our estimates are low, the bill to local taxpayers will be substantially higher. (0446, 0218-M –13)

Public Comment: Cost must be a major concern. While the EIS estimates may pass Federal transit muster, the alliance recommends an independent third party cost assessment be conducted in advance of any final funding package that is sent to Congress or the people of Northern Virginia. The study envisions a 50 percent Federal commitment, or about $1.7 billion. However, the Federal government won't commit to a specific percentage, only a dollar amount. If our estimates are low, the bill to local taxpayers will be considerably higher. (0446, 0146-T –12)

Public Comment: Cost must be a major concern. While EIS estimates may pass Federal Transit Administration muster, the Alliance recommends an independent third party cost assessment be conducted in advance of any final funding package that is sent to Congress or Northern Virginia residents. (0446, 0218-M –12)

Response: *The capital cost estimates of the two Build Alternatives of the Final EIS will be updated during the Project's preliminary engineering phase.. Those estimates will serve as the basis for the negotiations of the Federal Full Funding Grant Agreement. Cost controls in addition*

to the estimating process to date will include a value planning process, a value engineering process, risk analysis, the use of design-build procurement through the Virginia Public-Private Transportation Act, and continued use of project contingencies to account for design unknowns.

Need to Avoid a "Rail Only" Strategy

Public Comment: Establish realistic expectations in terms of implementing and phasing a Locally Preferred Alternative. Do not adopt a "rail only" strategy for which adequate funding is far from certain and that would stand in the way of more immediate, flexible and affordable transit systems. Remember, no member of our congressional delegation has expressed optimism that the proposed total for federal matching dollars is available in the next decade. (0446, 0218-M –14)

Response: *The selected LPA is the Metrorail Extension. It would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A total of $163.5 million in Federal New Starts funding has been appropriated for the Project through Fiscal Year 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and timing of federal funding participation, will be finalized following completion of preliminary engineering activities.*

Need for Further Explanation on Tax District

Public Comment: The cost of the system is approaching three to four billion dollars, not including debt services, which could be another two billion dollars. In addition, we are faced with a projecting annual operating budget deficit of one hundred and eight million per year. Regarding the cost of building the rail, Reston will bear an unfair amount of the construction, which will be over a billion dollars, with the federal government picking up the rest. Eight hundred million is projected from tolls and two to four million projected from a newly to be established tax district, which will include multi family. The tax district will most likely be expanded to include single families to offset the operating deficit. (0189, 0201-L –1)

Public Comment: There are two costs: The cost of building and operating this system, and the cost of our quality of life, both of which this rail proposed will have devastating impact as presently being presented. The cost of the system is approaching $3-4 billion, not counting debt service, which could add another $2 billion, as well as a projected annual operating budget of $108 million deficit. Regarding the costs of building the rail, Reston will have to bear the unfair amount of construction which will be over $1 billion, with the Federal government picking up the rest. $800 million is projected from tolls and $400 million projected from the newly established tax district, which will include multi-families and the tax district will most likely be expanded to include single families to offset the operating deficit. (0189, 0189-T –1)

Response: *The Dulles Rail Transportation Improvement District, as created by Fairfax County in February 2004 based on a petition of commercial landowners, does not allow the district's tax levy to be applied to single-family owner occupied homes. Section 8.1 of the Final EIS presents the capital funding strategy of the two Build Alternatives. Section 8.2 of the Final EIS presents the operating costs, revenues and subsidy allocation of these alternatives.*

Need for Further Explanation of Funding Sources by Jurisdiction

Public Comment: The newspaper says that is the only source of funds [tolls] to pay for rail to Dulles. Suggestion - how about the Commonwealth allocate 100% of the funds that Northern Virginia sends to Richmond to come back to Northern Virginia instead of the 49% Richmond currently sends back. This would pay for rail and a whole lot more in road improvements here in Northern Virginia. (0203, 0203-L –8)

> ***Response:*** *As described in Section 8.1 of the Final EIS, the Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act of 2000 and Dulles Toll Road revenues. For the remainder of the Full LPA, in addition to the Virginia Transportation Act of 2000 funds and Dulles Toll Road revenues, the Commonwealth may consider additional sources, including future transportation appropriations, to fund construction.*

Need to Further Explore Equity Among Jurisdictions

Public Comment: The rest of the County and the State benefit by the transit friendly growth in the corridor, and should help fund it. The current emphasis on the Toll Road for state funding and small tax districts for county funding fails to recognize that all the environmental risks are borne by the Corridor, but the benefits are shared widely. (0210, 0210-M –5)

Public Comment: 2010 is a long time to wait for service. We may run out of money before we get there. Too much state and county funding is coming from the corridor itself since the benefits are shared throughout the region. (0170, 0170-T –3)

Public Comment: The rest of the county and the state benefit by the transit-friendly growth in the corridor and should help fund it. (0170, 0170-T –9)

Public Comment: The current emphasis on the toll road for state funding and small tax districts for county funding fail to recognize that all the environmental risks are born by the corridor but the benefits are shared widely. (0170, 0170-T –10)

> ***Response:*** *In addition to the Virginia Transportation Act of 2000 funds and Dulles Toll Road revenues that are planned to fund the Wiehle Avenue Extension, the Commonwealth may consider additional sources, including future transportation appropriations, to fund construction of the remainder of the full LPA. Section 8.1of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share.*

Dulles Rail Not Dependent on Sales Tax Referendum

Public Comment: We also want to distinguish Dulles rail from the sales tax debate. As Delegate Plum has noted, and contrary to public perception, Dulles rail has its own comprehensive financing plan that is independent of the sales tax funds. He has stated, "The financial analysis included in the draft environmental impact statement indicates that the project, as far as state and local governments are concerned, is essentially self-funded. A combination of Federal funds, excess toll revenues and receipts from a special tax district, make the project possible. It is not affected by the recent cutbacks in the state transportation budget. It can go forward regardless of the outcome of the fall sales tax referendum." (0251, 0251-T –5)

Public Comment: We are also want to distinguish Dulles Rail from the sales tax debate. As Delegate Plum has noted and contrary to public perception, Dulles Rail has its own comprehensive financing plan that is independent of the sales tax funds. He has stated: "The financial analysis included in the draft environmental impact statement indicates that the project as far as state and local governments are concerned is essentially self-funded. A combination of federal funds, excess toll revenues, and receipts from a special tax district make the project [Dulles Rail] possible. It is not affected by the recent cut-backs

in the state transportation budget; it can go forward regardless of the outcome of the fall sales tax referendum." (0149, 0205-M –3)

Response: *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for Dulles as part of the Fairfax and Loudoun County its local shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly to reflect the sales tax referendum funds.*

Need for Further Explanation of Special Tax Districts

Public Comment: We request a financing plan which would have the bonds on the toll road paid off no later than 2016, but preferably this decade, and without the necessity of any full time tolls on the Access Road beyond the bond payoff date, and without the necessity of any special tax districts outside Tysons Corner. (0162, 0162-M –18)

Public Comment: We request a financing plan which will have the bonds and the Toll Road paid off no later than 2016, which we think is quite possible. (0184, 0184-T –15)

Public Comment: A number of comments have been made concerning special [tax] task districts. I'm not sure the public understands what that actually means. It means that people along the Toll Road, where there are mostly businesses, and you're talking about promoting businesses, are actually going to suffer as a result of additional taxes coming up. We have heard as much as 30 to 50 cents per hundred in additional taxes for each building, for instance, that we own. That's a heck of a lot of money. (0252, 0252-T –4)

Response: *DRPT prepared a preliminary financial plan for the Wiehle Avenue Extension as part of its Request to Enter Preliminary Engineering (August 2003) and will prepare the final financial plan for that extension during preliminary engineering. To fund the Commonwealth's share of the Dulles Corridor Rapid Transit Project with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations for the Wiehle Avenue Extension. A final decision on the revised toll structure would be made by the CTB after the completion of a formal traffic and revenue study and its administrative review process.*

Section 8.1of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. Although payments will not be due until December 2004, on July 1, 2004, Fairfax County began charging commercial landowners an additional 22 cents per $100 of assessed value for their properties on top of the base real estate tax rate of $1.13. Fairfax County projects that the tax rate could eventually increase to 29 cents per $100 of assessed value once a Full Funding Grant Agreement is executed.

Need Further Explanation on Federal Share of Funding

Public Comment: Now I don't know why that wasn't done. You can only get 60 percent Federal funding with BRT now. Maybe someone has an explanation for that. I don't know. But I'd like to know what it is because money doesn't grow on trees, we don't have the Tooth Fairy in Washington like we did when we built the Metro with 80, 90 percent Federal money. (0136, 0136-T –1)

Response: *The project is following Federal guidance for projects requesting New Start funding. The Conference Report accompanying the FY 2002 Department of Transportation Appropriations Act directs "FTA not to sign any new full funding grant agreements after September 30, 2002 that have a maximum federal share of higher than 60%". Federal commitments to fund New Start*

Projects are made by a Full Funding Grant Agreement (FFGA) between FTA and the project sponsor.

Need Further Explanation on Availability of Federal Funds

Public Comment: The second concern I have is since the Los Angeles subway was bagged a few years ago, the Federal DOT is not building underground - not funding underground transit systems any more. So I don't know whether the Tysons underground is going to be funded or not. Moreover, I haven't heard anyone guarantee there's going to be $100 million over the next 10 years to fund this project. Now maybe someone has something, more information than I have about that, and if they do, I would appreciate knowing about it. So these are two concerns. (0136, 0136-T –2)

Public Comment: So, you know, maybe this is a great thing, but let's at least get all the facts and information and let's wonder why we didn't go ahead and get the 80 percent Federal funding in 1999 when the project was only $1.9 billion and now it's 3.3 or thereabouts. How about the Federal funding? Is that available? I doubt it. When I hear the talk of the congress people, it's not. (0136, 0136-T –4)

Public Comment: There are two fundamentals I believe we have to look at: First of all, the availability of Federal money. This idea of the tooth fairy bringing $1.8 billion of Federal money in 10 years to Fairfax County and Loudoun County to build this system is just that, it's not going to happen, folks. And the people in Congress and the people in the Federal Transportation Administration will tell you that. So we ought to stop planning around something that is probably not going to happen. (0136, 0168-T –2)

Public Comment: The [Draft] EIS assumes the Congress will appropriate $200 million per year for this project, yet Congressmen Wolf and Moran both report that it's quite unlikely that even half that annual amount will be available. The congressmen's concerns were apparent even before the war on terrorism, the Homeland Security program, and the rapid increase in the national debt became such major issues. There's going to be a lot more competition for funding in the future. And if Federal funding is not forthcoming when scheduled, there are three possible outcomes, of course. Virginia and Fairfax County can make up the difference. We don't think that's likely, but if it were going to be the case, I think the taxpayers will want to know about it. Second, the project can be delayed until funding is available, and then you have the cost of delay, which I have mentioned before. (0138, 0138-T –4)

Response: *The Federal Transit Administration (FTA) does not have a policy against building underground, but does use a cost-effectiveness measure for New Starts projects, which considers the additional cost of building underground vs. a project's ridership.*

In 1999, the Project had not prepared an EIS as required under NEPA and could not have proceeded. Even in 1999, 80 percent of funding from FTA was not a given. The $1.9 billion estimate of the MIS did not have the benefit of more detailed engineering analysis, General Plan development, cost estimation, design contingencies, and updated year of expenditure escalation.

The selected LPA is the Metrorail Extension. It would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A total of $163.5 million in Federal New Starts funding has been appropriated for the Project through Fiscal Year 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and

timing of federal funding participation, will be finalized following completion of preliminary engineering activities.

Need to Address Equity and Reliability of Funding Mechanisms

Public Comment: The proposed rail funding mechanisms are not equitable nor reliable. (0139, 0139-T –3) (0139, 0280-T –3)

Public Comment: What we have, is the state and the county once again taking advantage of us. Whereas, the projects of this size such as the Chesapeake, Monitor/Virginia, Hampton Road tunnels, Route 58 in South West Virginia and even the Manassas Commuter Train, were are all funded by the Commonwealth of Virginia, why not us? And, to further reinforce that fact, it only shows how inapt our local politicians are. But, in essence the method of funding which you propose, is not only unfair, it is immoral. And to mention your failure to have a full public hearing on the funding as you had stated that you would hold. (0189, 0201-L –2)

Public Comment: What we have is a state and a county is once again taking advantage of us, whereas projects such as the size as a Chesapeake, the Hampton Road tunnels, and Route 58 in southwest Virginia, and even the Manassas commuter rail, are funded all by the Commonwealth of Virginia. Why not us? In essence, the method of funding which is being proposed is not only unfair, it is immoral. (0189, 0189-T –2)

Response: *The amount and percentage of capital funding of the two Build Alternatives by jurisdiction outlined in Chapter 8 of the Final EIS are based on the preliminary capital cost allocation agreement among the non-federal funding partners. The Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act (VTA) of 2000 and Dulles Toll Road revenues.*

Project Funding is Independent of Sales Tax Funds

Public Comment: I want to step aside for a second and talk about distinguishing Dulles rail from the sales tax debate. I think that is important. We learned today that Dulles rail does have its own comprehensive financing plan that is independent of the sales tax funds. For those who don't know, the Coalition for Smarter Growth has had a real problem with the sales tax being a new wish list for which the total costs have not been identified and includes an awful lot of road projects we have real concerns about and really no hook to better land use. Dulles rail, in contrast, has a good hook to better land use, has a specific funding plan that is independent of sales tax. (0149, 0149-T –9)

Public Comment: I also want to distinguish Dulles rail from the sales tax debate. For those who don't know, we have been opposed to the sales tax. I think it is important to note that Dulles rail has its own comprehensive financing plan that is independent of the sales tax fund, a plan that relies on a variety of sources including the special tax district. A special tax district seemed appropriate to us because local landowners, commercial landowners will realize significant land use value increases from the arrival of Dulles rail. Unlike the sales tax project list, which does not have a full cost assigned to it, and has very few -- has no links to land use, Dulles rail - we are working on the land use links and has a full funding formula. So we should not confuse the two. (0149, 0180-T –6)

Response: *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*

Need to Further Explain Funding Partners

Public Comment: You could use the surplus from the Reston Community Center toward this if you can get it before they think up something else new to spend it on. (0082, 0082-CC-2)

Response: *The Reston Association is not a Project funding partner.*

Need to Explain Capital Repair Funding Sources

Public Comment: The other thing that is not being considered is that Metro says that it's going to need up to 9 billion in capital repairs over the next 20 years just for the existing 103-mile system. So where is the money going to come from? It's going to come from me. (0112, 0245-T –10)

Public Comment: Virtually no one believes that the referendum will solve our transportation crisis. Remember the existing Metrorail has an unfounded capital requirement over the next 25 years of $4.5 billion. Where is the planning for this? The reckless financial planning that brought us Enron and WorldCom are what is bringing us the sales tax referendum and the planning for the Dulles rail project. The referendum legislation now allows government to sell tax-supported bonds without having to hold a bond referendum. (0140, 0200-E –6) (0140, 0140-T-5)

Response: *DRPT and WMATA recognize that the infrastructure renewal and capacity improvements of the existing Metrorail system must be funded under the WMATA Capital Improvement Plan, of which the present Metro Matters program is the first element. Each WMATA Compact member jurisdiction will decide on the funding mechanism for its share of the Metro Matters program.*

Cost Estimates Inconsistent with Purple Line study

Public Comment: The cost estimates do not gel with Maryland's Purple Line study, which I'm quite familiar with, because I fought the inner Purple Line and the outer Purple Line when I lived in Montgomery County, and now I've become a passionate supporter of the inner line, and that's because what Maryland did in its Purple Line study was to determine, one, that it admitted that it offered no relief to traffic congestion. (0112, 0245-T –2)

Public Comment: The cost estimates do not gel with Maryland's Purple Line and Corridor Cities Transitway data. (0112, 0269-M –3)

Response: *The project capital costs are compatible with projects of this size, and are based on a methodology appropriate with the design stage of the Final EIS and the final General Plans. The Purple Line is presently undergoing definition as to its alignment, type of service (bus or light rail), schedule, and operation. These factors do not allow for a one-to-one comparison with the Dulles Corridor Metrorail Project capital cost estimates.*

Need to Investigate Project Cost Effectiveness

Public Comment: Prentiss Properties supports public transit being bought to the Dulles-Tysons corridor, as long as it is done in a fiscally responsible manner. After review of the EIS, we are very concerned about a number of issues. We understand that rail will likely move the most people, but it does not appear to be the best solution in terms of dollars invested per passenger. Rail may move double the passengers, but it will cost at least seven times as much. (0139, 0139-T –1)

Public Comment: Prentiss Properties supports public transit being brought to the Dulles/Tyson's Corridor, as long as it is done in a fiscally responsible, well conceived manner. After review of the EIS, we are very concerned about a number of issues. We understand that rail will likely move the most people, but it does not appear to be the best solution in terms of dollars invested per passenger. Rail may move double the passengers, but it will cost at least seven times as much! (0139, 0280-T –1)

Response: *The selection of the Metrorail Extension as the Locally Preferred Alternative was based on a number of objectives, among these being cost-effectiveness. Other goals and*

objectives include increasing transportation services, transit ridership, supporting future development, supporting environmental quality, and serving diverse populations.

Need to Further Explore Willingness to Pay

Public Comment: Have you surveyed those in the special tax district to determine how much they would be willing to pay for being near the system? Only with their contribution do you have any hope of reducing the fares to an attractive level. (0166, 0166-T –3)

Response: *Section 8.1 of the Final EIS describes the creation of the first Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. A new landowner's group, called the Western Alliance for Rail to Dulles (WARD), has formed to explore the potential of developing another tax district, similar to the Dulles Rail Transportation Improvement District, which would include properties within Fairfax County west of Wiehle Avenue. WARD has drafted a petition and began circulating it among landowners in July 2004.*

Need Further Explanation on Public-Private Funding

Public Comment: Page S-28 Funding Needs and Strategy lists the Capital Costs and the Operating and Maintenance Costs for the various alternatives. It also states that funding for these costs could be provided through a combination of public and private sector funding. However, no information is provided as to how this funding translates to increased tolls, additional real estate taxes, or special taxes levied. Before any judgment as to selection of an alternative can be made, specific data needs to be provided in this regard for each alternative. (0228, 0228-E –1)

Response: *Section 8.1 of the Final EIS describes the funding partners, their proposed funding sources, and the current status, availability, and capacity of the funding sources. The section also presents a discussion on the resulting increase or change in rate to support the funding obligation..*

Tax Burden Will Constrain Other Projects

Public Comment: The Federal government is not going to support this project beyond $100 million per year, if that, and they probably shouldn't even step up at that level. This type of crippling tax burden will place severe constraints on the ability of our area to improve the Beltway, I-66, Route 28, Route 1, and other areas. I cannot see why supervisors from districts not served by this system would not vigorously oppose this wasteful expenditure of public money that will constrain the ability to solve transportation bottlenecks in their districts. (0162, 0162-M –9)

Response: *The regional Transportation Planning Board (TPB) approves the long-range plan of transportation projects in accord with available funding over twenty-five years. The TPB has approved the Full LPA to be part of the region's long-range plan.. Members of the TPB include representatives of local governments; state transportation agencies; the Maryland and Virginia General Assemblies; the Washington Metropolitan Area Transit Authority; and non-voting members from the Metropolitan Washington Airports Authority and federal agencies,*

The Full LPA would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension.

Follow Up On Rail Initiatives by Congressmen

Public Comment: As a result of the events of September 11th, our three congressmen, Wolf, Davis and Moran, wrote to the Secretary of Transportation, Norman Mineta, in October, requesting that the Secretary work on developing a financial plan that would expedite the bringing of rail service to Dulles airport. With the closing of Reagan National Airport following the attack on our city, the Congress was confronted with the difficulty in getting to Dulles, which became the primary functioning airport at that time. In light of these recent experiences, I think it is far more likely that Congress will appropriate funds for rail to Dulles than has been expressed tonight. What is absolutely certain is that if we do not follow up on the initiatives that our congressmen have started and request funding for Dulles rail, then certainly we will not see rail built. (0144, 0190-T –2)

Public Comment: My only other note that I wish to say is the fact that, since I live in Reston, the new tax that they're going to be doing as far as the Toll Road, possibly, and a sales tax-- we're paying for the rail, we've been paying for the rail through the tolls. We need to build it now. (0081, 0285-T –2)

> ***Response:*** *The selected LPA is the Metrorail Extension. It would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A total of $163.5 million in Federal New Starts funding has been appropriated for the Project through Fiscal Year 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and timing of federal funding participation, will be finalized following completion of preliminary engineering activities.*

Need Further Explanation on Cost Share by Jurisdiction

Public Comment: As outlined in the draft environmental impact statement, the Dulles rail is estimated to cost approximately $3.3 billion. Fairfax County's share of the cost is presently estimated at $514 million, or 15.6 percent of the total project's cost. All or a portion of this will be addresses by the LEADER initiative, but only if there is rail in the corridor. As part of the 25 percent local match required by the Federal Transit Administration, Fairfax County's share will be combined with Loudoun County's and a share from the airports authority. The combined local share will be matched with $800 million from the Commonwealth of Virginia, and this combined local state share will be matched with the Federal government's 50 percent share for the project's total cost. (0154, 0182-T –4)

> ***Response:*** *Section 8.1 of the Final EIS discusses the capital funding strategy of the selected LPA – the Metrorail Extension - including funding shares of the capital costs. The Full LPA would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time.*

Need More Information on Project Funding

Public Comment: We do not have enough information available to state that we support the taxation required to pay for the project, therefore, at this time we do not support the DCRTP. We will not support any alternative unless it is fully funded. (0021, 0021-L –1)

> ***Response:*** *Section 8.1 of the Final EIS discusses the capital funding strategy of the selected*

LPA – the Metrorail Extension - including funding shares of the capital costs. Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. Although payments will not be due until December 2004, on July 1, 2004, Fairfax County began charging commercial landowners an additional 22 cents per $100 of assessed value for their properties on top of the base real estate tax rate of $1.13. Fairfax County projects that the tax rate could eventually increase to 29 cents per $100 of assessed value once a Full Funding Grant Agreement is reached..

Draft EIS Not Competitive Under FTA Criteria

Public Comment: THE DEIS FAILS TO BE COMPETITIVE UNDER THE FEDERAL TRANSIT CRITERIA FOR FUNDING UNDER THE NEW STARTS PROGRAM. If a rapid transit proposal does not receive the 52% Federal share of funding, which in this case is up to $1.8 billion, it cannot be built. It's that simple. The competition for funds is intense and becoming more so each year as budget pressures mount. The Federal Transit Administration receives ten to twenty times more applications for funding each year than it can recommend for funding. Given that circumstance, wouldn't it have made sense to organize the DEIS and the local evaluation process around the criteria the FTA uses? We don't believe many of the people concerned with this issue have ever seen these criteria. We have copies of them and of two recent GAO reports to Congress for your review today. Bottom line: when reviewed against the FTA criteria, this DEIS fails to make a winning case for the MetroRail alternative, and it will take a lot of additional work to make the BRT proposal competitive as well. (0138, 0476-L –3)

***Response**: Several of the criteria used in the New Starts evaluation process can be used as measures to evaluate a project. However, it should be noted that the purpose of the evaluation of projects under the New Starts criteria does not directly correlate with the requirements for alternatives evaluation under the NEPA process, which is the intent of the Final EIS. The New Starts criteria are used to provide a consistent evaluation basis to compare very different technologies in very different regional settings, not to distinguish between multiple alternatives within the same corridor. As such, the New Starts process does not contain nearly enough information to satisfy the legal sufficiency requirements of NEPA or address all of the local issues identified during the scoping process. Information from the Final EIS is used to prepare the New Starts data for the selected Locally Preferred Alternative - the Metrorail Extension - and the financial analysis in Chapter 8 of the Final EIS is a component of those evaluations.*

Need for More Thorough Financial Analysis

Public Comment: The DEIS treated the financial analysis in a very superficial manner. (See pp 8-1 to 8-24) For a transit project of this magnitude and for a lack of funding sources, it is important to ensure that the planning process gives fully objective financial data that is available for citizen review and comment. Based upon the experiences of other major transit projects in the area as well as rail projects in other cities, what is expected cost overruns for each of the core transit sites to include Tysons Corner, Reston, Herndon-Monroe, Dulles Airport, and Loudoun? (0147, 0459-L –24)

***Response**: Chapter 8 of the Final EIS discusses the capital cost estimates and capital funding strategies of the two Build Alternatives. Every effort is being made to avoid cost overruns. The recent completion (January 2001) of the original Metro 103-mile system was done on or ahead of schedule and considerably under budget.*

Public Comment: For WMATA and the elected officials to select the Locally Preferred Alternative without first doing a much more thorough analysis of the financial aspects is extremely risky. Realistically, MetroRail service to Dulles will not start until at least 2015. That is because rail can't carry the first passengers until the last piece of track is laid and the last station finished, and big projects always take longer than projected. BRT saves time. BRT builds on the existing express bus system. Nothing gets

discarded. Heavy construction is minimized. Significant improvements will occur in months, with full service to Dulles within two years. (0112, 0462-L –32)

> ***Response**: The selected LPA is the Metrorail Extension. The revised implementation schedule shows a 2015 opening year for the full LPA, dependent of the availability of funding. The existing Corridor express bus service will continue and be enhanced during the two phases of construction of the Full LPA.*

Public Comment: WMATA and VDRPT need to provide more than 24 pages of financial analysis to determine the true costs of the project. The project team provides no break down on the estimated $111 million subsidy for rail by county. It boldly proclaims a $1.1 billion benefit for the local economy, but provides no details on who benefits. Could it possibly be ONLY those owners of properties right at rail stations, plus WMATA and its unionized work force? What is the benefit to Loudoun County and Fairfax? (0112, 0462-L –50)

> ***Response**: The allocation of operating subsidy for the opening year and forecast year, by WMATA Compact member jurisdiction, is presented in Tables 8.2-1 and 8.2-2 of the Final EIS.*
>
> *As described in Section 5.1 of the Final EIS, the selected LPA would have a positive effect on the local economy as a result of capital expenditures, namely construction costs, vehicles, and systems. These effects include impacts on employment, output and earnings as these funds are spent and re-spent throughout the economy. These temporary effects vary for each alternative, based on the amount of construction expenditures, the type of expenditures and timing of the expenditures. Measuring these effects provides a measure of the relative effects of two Build Alternative as compared to the No-Build Alternative. While the analysis does account for funds that would have been spent within the counties whether a Build Alternative is implemented or not, it is important to note that these effects represent the redistributive economic effects of increased federal and state funding within Fairfax and Loudoun counties. These are one type of economic impact, and do not necessarily reflect the full cumulative effects of the project on the regional economy.*
>
> *The Project Team applied multipliers from the US Department of Commerce, Bureau of Economic Analysis' Regional Input-Output Modeling System (RIMS II). These multipliers, which reflect the industrial base of the region, are multiplied by the direct capital expenditures in order to calculate the total effects on the regional and state economy. The multipliers used reflect the economic base of Fairfax and Loudoun Counties combined, and as such the total effects cannot be broken out by County.*

Public Comment: Financing details are sketchy at best. Devoting only 24 pages of more than 3,000 in the EIS to financing is not good, particularly when the FTA's "new starts" program has only $6 billion to dole out. WMATA and VDRPT have not met the FTA criteria for having a "evidence of stable and dependable financing sources to construct, maintain and operate the proposed system or extension." However, there is sufficient funding to put express buses on the Dulles Access Road right now. (0112, 0462-L –8)

> ***Response**: The financial analysis presented in the Final EIS summarizes the estimates of capital costs, operation and maintenance costs, revenues, and subsidy allocation for the two Build Alternatives. NEPA requires the environmental impact statements to succinctly describe the data and analyses used to understand the effects of the alternatives. In this case, it is a summary of the estimated costs and proposed funding sources. DRPT prepared a preliminary financial plan for the Wiehle Avenue Extension as part of its Request to Enter Preliminary Engineering (August 2003), and will prepare the final financial plan for that extension.*

Public Comment: In your cost factors and in projecting ridership, as I understand it, in some of your models in terms of people using cars and people using mass transit, if you are anything like VDOT, which I think your models are, you use a standard inflation factor to project the cost of petroleum for fuels for

cars. I would recommend that you do some sensitivity analysis and that you look out over the next 20 to 25 years and adjust your gasoline costs to say as much as 10 percent increase per year. (0258, 0258-T –3)

> ***Response:*** *The travel demand model used sensitivity tests as part of its calibration and validation procedure. Automobile costs are reflected in the model using a number of inputs, including highway costs, toll costs, and parking costs.*
>
> *For consistency with Metropolitan Washington Council of Government (MWCOG) regional planning assumptions, the project has used the regional assumptions on future costs, land use, and socioeconomic makeup. If the model were adjusted to reflect gasoline costs increasing at 10 percent per year for 25 years, the result would be gasoline costs that were $1.50 a gallon in 2000 would be $16.25 a gallon in 2025. This high gasoline cost would change the mode split and ridership results, likely resulting in higher transit ridership. The high gasoline costs over such a length of time would likely spur development of alternative fuels technology that would partially offset the increased gasoline costs, making the long range year 2025 results inconclusive.*

Need for Further Clarification of Proposed Funding Sources

Public Comment: What percent of the county's financial resources available for transit strategies will be consumed by each transit alternative? (0147, 0459-L –27)

> ***Response****: Each of the capital funding partners will decide on the funding mechanism for its share of the capital costs. Likewise, each WMATA Compact member jurisdiction will decide on the funding mechanism for its allocation of the operating subsidy of the Metrorail system. These funding agencies and jurisdictions conduct their own financial capacity analyses. During preliminary engineering of the Wiehle Avenue Extension, DRPT will prepare the Extension's final financial plan, which FTA will review for financial capacity as part of negotiations for a Federal Full Funding Agreement.*

Public Comment: Financing of Metro Rail would not only be a strong financial burden on the citizens in the corridor and particularly Reston, but it is unfair since the Virginia Commonwealth's portion is from the Dulles corridor (Dulles Toll Road and Dulles Corridor Tax District) instead of from the entire Commonwealth. In fact I believe this proposed funding plan in overly discriminatory and violates the civil rights of the citizens in the corridor, particularly those in Reston. (0189, 0448-E –6)

> ***Response****: As described in Section 8.1 of the Final EIS, the Commonwealth of Virginia will be responsible for 25 percent of the Project's capital costs. For the Wiehle Avenue Extension, the Commonwealth will use revenues from the Virginia Transportation Act of 2000 and Dulles Toll Road revenues. A planned toll increase would raise tolls at the main toll plaza to $0.75 and at each ramp toll plaza to$0.50. For the Full LPA, in addition to the two sources of the Wiehle Avenue Extension, the Commonwealth may consider other sources, including future transportation appropriations. Section 8.1.2.3 of the Final EIS also describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension.*

Public Comment: Why were there no full public hearings held as promised on the proposed funding? Financing the Metro rail is expected to cost 3 1/2 billion dollars. What is the debt service on this amount? What is the annual operating deficit? And who will have to pay it? Why is this project proposed not being decided by a public referendum? Who is the responsible public official(s) and final decision-maker on this proposed project? Who will own the system if built? How much longer will the tolls remain on the Dulles toll road to fund the rail? (0189, 0448-E –7)

> ***Response****: Three Public Hearings were held on the Draft EIS in July 2002 and two public*

hearings were held on the Supplemental Draft EIS in December 2003. At these Public Hearings the capital cost estimates and operating subsidies were presented for each Build Alternative. Chapter 8 of the Final EIS provides the capital and operating funding strategies. The project itself is not subject to a public referendum; however, individual jurisdictions may have hearing requirements for their share of the capital funding. The decision-making bodies are the Virginia Commonwealth Transportation Board (CTB), the WMATA Board of Directors, and the Federal Transit Administration. Commitment by individual funding partners to specific funding sources is not required until the project enters into a Full Funding Grant Agreement (FFGA) with the FTA. The duration of increased tolls as a source of revenue for the Wiehle Avenue Extension is through 2016, as presented in DRPT's preliminary financial plan of August 2003. However, the Commonwealth is currently conducting a rate adjustment study for the Dulles Toll Road. The results of the study and formal recommendations are expected in late 2004. Following this, a final decision on a revised toll structure would be made by the CTB in late 2004.

Public Comment: Counting on Congress to appropriate the required amount for MetroRail is unrealistic, too. MetroRail requires Congress to appropriate $200 million annually, yet Congressmen Wolf and Moran have warned that not even half that annual amount will be available. The War on Terrorism, the Homeland Security program, and the rapid increase in the National Debt are setting new priorities, and spending an extra $3 billion to get the same rapid transit results will not survive the appropriations process. (0112, 0462-L –36)

Public Comment: Primary concerns have been and continue to be the lack of any definitive federal funding commitment and of transit supportive densities/land use patterns. In terms of funding, the reality is that the timing and magnitude of the federal government's contribution will dictate what expanded transit services are provided and when. To date, no federal commitment has been made to anything other than BRT, and no member of our congressional delegation has expressed optimism that anything approaching $1.5 billion in federal money will be available in the foreseeable future. (0446, 0446-E –2)

***Response**: The selected LPA is the Metrorail Extension. It would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. As stated in Chapter 8 of the Final EIS, DRPT and its funding partners are seeking $760.7 million in Federal funding for the Wiehle Avenue Extension through FTA Section 5309 New Starts program. This funding level represents 50 percent of the estimated project costs, consistent with FTA's recent practice for major transit capital investments. A total of $163.5 million in Federal New Starts funding has been appropriated for the Project through Fiscal Year 2004 to support project planning, environmental review, and engineering activities. An additional $20 million of New Starts funding for the project is expected in FY 2005. In addition to these appropriations, DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. A Full Funding Grant Agreement will be required to secure any authorized federal New Starts funding for construction of the Wiehle Avenue Extension. The terms of the FFGA, including the level and timing of federal funding participation, will be finalized following completion of preliminary engineering activities.*

Public Comment: Regarding funding availability, we know that, in reality, the funding plan presented in the DEIS is dependent on a number of future actions including the passage of the Transportation Sales Tax referendum in November. Another even more significant concern is whether the authorization and appropriation of adequate level of federal funding will be approved by Congress and the President, no sure thing given the propensity of this administration to short change every program it undertakes. (0387, 0387-L –2)

***Response**: The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly. With respect to Federal funding, please see the response to the comment above.*

Public Comment: The EIS process is an exercise in futility if funding for the federal, state and local shares of providing some type of rapid transit system through the corridor cannot be expected. Funding should be reasonably assured before a Locally Preferred Alternative is selected. Rationale: There is currently no assurance of funding to fulfill the federal, state or local financial shares of providing rail in the corridor. (0402, 0402-L –2)

> ***Response****: The NEPA evaluation of alternatives and the New Starts evaluation of Wiehle Avenue Extension are two separate Federal processes. Under the New Starts program, DRPT has prepared a preliminary financial plan that justified the entry of the Extension into preliminary engineering. The preliminary financial plan and the Final EIS describe the capital and operating funding strategies.*

Public Comment: Fairfax County should take the lead in developing a financial program for implementing these recommendations. Three sources of funds should be seriously investigated and implemented in the appropriate manner: (a) use of windfall property tax receipts that will be realized from increases in commercial and residential property tax assessments in the station areas, (b) parking fee revenues, and (c) air-rights lease and sales revenues. The windfall property tax receipts will occur in the station areas, as has been realized in well-planned transit station areas throughout the country. For several years after a Full Funding Grant Agreement is negotiated, property assessments in the station areas will almost certainly increase at a significantly greater rate then the countywide average. Each year, all of the increase above the countywide average, or a portion thereof, can be put into a newly created Dulles Corridor Station Area Development Fund. This should be done in accord with a short- and long-range financial development and implementation program for the station areas, based on all the above recommendations. Part of the task of developing this program should be sufficient analysis of the impacts of such a program on overall County revenues and costs. It should not be difficult to demonstrate convincingly that many of above recommended programs will significantly increase net County revenues (i.e., revenues in excess of expenditures). For example, better pedestrian station access and air-rights development will both increase property values (and tax receipts) and decrease transit operating subsidies. Over the course of implementing this program, these impacts should be continuously and carefully monitored. Specific forecasts of expected impacts on County revenues and expenditures should be made and documented, so that the monitoring process can be refined each year with experience. This process will provide assurances that the policy and program is a significant net financial gain to all County taxpayers. Parking charges at park-and-ride facilities should be initiated at appropriate dates in the future, based on the work to be done in accord with recommendations above. The resulting parking revenues are likely to provide significant earlier amounts greater than the other two sources. However, the property tax windfall revenues are likely to provide greater amounts in years after Dulles rail operations begin. We recommend that air-rights lease and sale fees be set at a low level, perhaps just high enough to cover little more than administrative costs, in order not to discourage desirable forms of such development. Perhaps such fees should be waived in some cases (e.g., affordable housing) in order to encourage such development. (0478, 0484-E –26)

Public Comment: Who will profit from huge transit investments in the area - how will they contribute to the costs, how can they mitigate the costs (donate land, money, etc.) and how will they influence the decisions. (0235, 0235-E –6)

> ***Response:*** *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. In effect, the landowners have elected for the County to tax their properties in order to establish a revenue stream for the County share of the capital costs. There is no expectation of net parking revenues nor are there plans for air rights development at the Project's stations.*

Public Comment: The costs to build the Tysons Corner DCRTP segment represents about 65% of the total costs of the rail option. It appears that the contribution of monies coming from the Tysons Corner

area will cover about 50% of those costs leaving the remaining to be made up from Toll Road increases. (0427, 0427-E –7)

> ***Response**: The preliminary financial plan for the Wiehle Avenue Extension describes the Federal share of capital costs at 50 percent, the Commonwealth of Virginia share at 25 percent and the Fairfax County share at 25 percent.*

Concern for Cost Overruns

Public Comment: WMATA says MetroRail will cost $3.3 billion, but WMATA's projects average an 83% cost overrun, according to the Urban Mass Transit Fact Book. More than likely, Dulles Rail's complete buildout could exceed $5 billion. I make this assertion based on the gargantuan construction cost overruns that WMATA incurred in constructing the 103-mile Adopted Regional System (ARS), where costs balloons from an estimated $2.5 billion to more than $12 billion (or more than $20 billion in constant year 2000 dollars). Additionally, in research subject to peer review (unlike the Dulles Rail Model), published in the respected Journal of the American Planning Association, an international survey of 58 rail projects revealed an average cost escalation of nearly 45% (these are enormous cost overruns, but still smaller than those WMATA has managed to rack up in 30 years of building rail lines - see http://c1.planning.org/japa/pdf/japaflvvbjerg.pdf for the Journal of the APA article). (0112, 0462-L –33)

Public Comment: WMATA says Metrorail will cost $3.3 billion, but WMATA's projects average an 83% cost overrun, according to the Urban Mass Transit Fact Book, which is based on FTA data. More than likely, Dulles Rail's complete buildout could exceed $5 billion. (0112, 0462-L –9)

Public Comment: Cost - We are concerned that the estimated $3.3 billion cost for the proposed Dulles Corridor rail transit system will undoubtedly increase, perhaps appreciably, by the time a Locally Preferred Alternative is approved, funding is expected, and construction proceeds. Rationale: Recent examples of greatly underestimated project costs are the Mixing Bowl (95/495) and the Wilson Bridge. This necessitates borrowing from other projects to fulfill financial obligations. (0402, 0402-L –10)

Public Comment: I know from my own experience in real estate and construction, rarely do large projects get completed on time and on budget. There's always something unexpected about that arises. And the same will be true for the metrorail project. It will take longer to build, it will end up costing more than we think. Look at the Wilson Bridge and the Springfield interchange project as examples of that. (0183, 0183-T –3)

Public Comment: Members of this panel, I worry. I worry when I read that it is common for major transit projects to have 100 to 125 percent cost overruns. (0147, 0177-T –2)

Public Comment: The EIS projects metrorail to cost $3.3 billion to build, but that estimate contains no contingency, we understand, for costs incurred if Metro fails to meet the very ambitious deadline to commence service. In such event, revenues will not start when projected, costs will continue to escalate with inflation, and interest costs will run, whether those interest costs are recognized formally or not. Also, it's impossible to predict the cost of capital in these turbulent times, which makes a contingency even harder to come by. We believe the actual cost of the system will be at least 100 percent higher than the estimate which, by the way, is quite common with large infrastructure, transportation infrastructure projects in the United States. We have been told that the actual costs of the existing metrorail system, the 103-mile system now in effect, ended up being well in excess of double the original estimate back before the system was started. We are trying to find out how the actual costs of the recently opened Brentwood Line compares to the original estimate. This information should be made public before the decision is made to go forward. BRT, on the other hand, will cost $300-500 million, according to the EIS, but we believe that sum can be value-engineered to be more in line with similar systems built in the U.S. and elsewhere, and we believe it will be under $300 million. If there is a funding crisis, the system can adjust much more easily with BRT than metrorail. (0138, 0138-T –3)

Public Comment: The Dulles Corridor Transit project could be significantly under costed. Historically, cost overruns on projects of such significant scope are fairly routine. Cost overruns above 100 percent are not unusual. At the project information meeting at the CTI location, Mr. Hill stated that the financial analysis was still in process and was not available for community review. Citizens should have access to all the information, including the financial analysis. (0147, 0459-L –23)

Public Comment: States that all Metro projects cost 78% over budget, which means that this project will likely cost $5 billion. FTA would have to grant $200 million per year, using a 50-50% federal/state/local-matching ratio, to be open by 2025. (0112 8-2)

> ***Response**: The selected LPA is the Metrorail Extension. It would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time.*
>
> *The ultimate cost of the LPA relies on a number of assumptions, including project schedule, major cost drivers, inflation rates, expenditure forecast, funding availability, and financing requirements. During the project's next phase of preliminary engineering, DRPT will prepare the final financial plan, which will include an update of the capital cost estimate and a formal risk assessment. Section 8.3 of the Final EIS provides an initial discussion of risks and uncertainties.*
>
> *The Urban Mass Transit Fact Book is published by a public policy consulting firm and contains a number of independent assumptions regarding construction costs. The most recent WMATA construction program is the Fast Track Program adopted in December 1991 and competed in January 2001. The Fast Track Program included construction of the last 13.5 miles of the Adopted Regional System for $2.1 billion. By using an accelerated construction program with strategies designed to compress schedules and reduce costs, the program segments were completed on schedule or earlier, at or below budget. The $420 million in assured savings has been reserved for construction of the Branch Avenue Yard and procurement of additional rail cars.*

Need to Satisfy New Starts Funding Criteria

Public Comment: Also, Metrorail does not appear to satisfy the FTA "new starts funding" criteria. According to recent General Accounting Office (GAO) reports and testimony to Congress, BRT expansion is needed to expand the limited new starts funding under TEA 21. According to John Anderson, managing director, physical infrastructure issues for GAO, FTA will calculate "evidence of stable and dependable financing sources to construct, maintain and operate the proposed system or extension." (GAO-02-840T, page 4) It is my view that relying on a special taxing district and toll increase is not "stable and dependable financing." Most developers in the special taxing district are not going to be prime beneficiaries of "bonus densities." Furthermore, to raise $152 million in Loudoun County from the BPOL tax is absurd. Lastly, DRPT and WMATA have assumed that fares do not increase with inflation. Page 61 of the "methodology" special report states: "Early in the study, a decision was made to use a fare inflation rate equivalent to a third the rate of the consumer price index (CPI)." (0112, 0462-L –37)

> ***Response**: WMATA is unusual among the urban transit systems insofar as it does not have a dedicated source of funding; each WMATA Compact member jurisdiction has its own source of funding. The U.S. Secretary of Transportation determined on August 13, 1982 that these sources were stable and reliable. As part of the review of DRPT's final financial plan of the Wiehle Avenue Extension, FTA will likely evaluate the stability and reliability of the WMATA Compact jurisdictions to fund the infrastructure renewal of the Extension.*
>
> *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension.*

Loudoun County presently funds the local share of transportation projects through the use of the local gasoline tax and the Business Professional and Occupancy License (BPOL) revenue. In FY 2004, the adopted six-year Capital Improvement Plan (CIP) allocated $1.9 million from the County Public Transportation Fund and $23 million from BPOL pledge bonds for FY 2005-2010 to the Dulles Corridor Rapid Transit Project. Loudoun County is proposing the use of these funding sources for its share of the Full LPA capital costs..

The commenter is correct that the escalation of fares has been held to a rate one-third the rate of inflation. The fare escalation outlined in the Final EIS is based on current fare levels and recent WMATA fare increases. Metrorail fare revenues presently generate the highest fare recovery rate of any major transit system at over 70 percent of operating and maintenance cost.

Public Comment: During this last part of the planning phase, please put forth every effort to resolve outstanding design and operational issues described above and brought up by others during this public hearing process. You should also strive to maximize the potential of the transit proposed for this corridor, whichever mode it is. Emphasize the positive aspects of transit in the corridor. For the Dulles project to compete favorably against other possible transit projects nationwide for new starts money, it's important that the transit alternatives and particularly the locally preferred alternative are presented in the most favorable possible light. (0387, 0387-L –48)

***Response**: FTA has approved the DRPT Request to Enter Preliminary Engineering for the Wiehle Avenue Extension. Thus, the Project has entered the New Starts program. Moreover, DRPT received a Federal grant to fund the phase of preliminary engineering. DRPT will submit annual New Starts updates to FTA.*

The Final EIS and final General Plans have fully described the LPA in all aspects and prepared the Project for preliminary engineering.

Use of Toll Revenues to Fund Transit Improvements

Public Comment: Support the Commonwealth's use of toll revenues to provide transit improvements in the corridor in a timely manner. Use of toll revenues from the Dulles Toll Road should be limited to use in the corridor. (0396, 0396-L –5)

***Response**: The Commonwealth Transportation Board Policy is to direct toll revenues for highway and transit use in the corridor. The Commonwealth Transportation Board amended their policy in September 2001 to dedicate a minimum of 85 percent of excess Dulles Toll Road Revenue to public transportation in the corridor.*

Public Comment: As a former regular user of the Dulles Toll Road who is now a casual user of it, I wanted to add these comments to my suggestion that increased toll revenues should not be counted on as part of the financing package. Many of the people who use the Toll Road would not be using either the BRT or one of the rail options currently proposed for the corridor. I don't mean this to sound rude, but it is almost as if those who prepared the Draft EIS did not travel the Toll Road during the morning or afternoon rush hours. If they had, they would have observed that a goodly number of the cars using the Toll Road are traveling to/from Maryland or are traveling elsewhere in Virginia using the Outer Loop of the Beltway. Also, quite a few people use feeder roads that are perpendicular to the Toll Road and then use the Toll Road as part of their drive to their final destination. During the evening hours, there are quite a few people who exit at Route 7 and head to points west. Also, I'm certain there is a certain percentage of Toll Road use by people using it as part of a non-commuter related trip and for whom neither the BRT nor a rail option is something they would find useful in making such a trip. Increasing the toll to help fund the rapid transit project would be an inequitable solution to finding money for the rapid transit project. This is especially true because it appears an unelected group of people would be making this decision with, what appears to be, very little recourse for those who use the road and would not use BRT or a rail option. I'm

sure those who use the Toll Road did not envision that revenue from it would be treated as a nearly unending supply of money for various other transportation projects. (0401, 0401- L-3)

Public Comment: What is the proposal for funding? I read in the Post you were talking about either raising tolls on the Dulles Toll Road by $1 or to $1 and over what period of time. Would the Greenway fares have to increase too? (0112, 0112-E –5)

Public Comment: Do Not raise our tolls. We are the only people in the metro area paying tolls now. Until all the other roads are charging $0.75, it is just not fair to make us pay more. (0082, 0082-CC-1)

Public Comment: In the last few weeks a new specter has arisen: a plan to double or triple the Dulles Toll Road tolls to pay for the same transit project that we're supposed to pay for with the sale tax. The worst thing you can do is to tell people they may have to pay twice for the same project, or just let hints in the newspaper stand…and see how many vote for the for the tax. Please clarify what this is all about, and whether we are expected to pay two different ways for the same project -- before the elections. (0114, 0114-E –7)

Public Comment: Increasing tolls on the Dulles Toll Road and creating a Dulles Corridor tax district will place a $1.3 billion tax burden on the Dulles corridor. This will drive businesses away from the new rail line, when we should be attracting businesses there. However, it may be just the thing to revitalize the Route 1 corridor. (0140,0200-E –4), (0140, 0140-T-4)

Public Comment: Please do not support the proposed expansion of Metrorail to Loudoun County via increasing tolls on the Dulles Toll Road. This expansion will cost billions and benefit only a few thousand residents of Loudoun County. Most of my neighbors in Ashburn work in either Loudoun or Western Fairfax County and would gain zero benefit but pick up the majority of the cost via the increased tolls. This is insane! (0295, 0295-E –1)

Public Comment: The cost to the taxpayers for this rail proposal, particularly the proposed $1 increase in tolls on the toll road, I think is going to lead to a taxpayer revolt. I'm finding that taxes here are rivaling what I paid in Montgomery County. (0112, 0245-T –4)

Public Comment: We are also concerned that the rail options will likely require tolls on the Dulles toll road to be raised substantially in order to fund the state's component of the capital costs. Raising these tolls may be theoretically feasible, but it will make the toll road corridor a less desirable place to locate businesses, thereby lowering property values as well as creating unmanageable congestion on alternate routes. Again, our competitive position versus other Virginia counties and Maryland may be further weakened. (0139, 0139-T –7)

Public Comment: If you must have rail, do it with no increase in the now unjustified toll. (0155, 0155-T –5)

Public Comment: I represent the users of the toll road who are fed up with the toll, long after the road has been paid for. I commute daily on my way to Columbia and back. We are the only commuters in the area who have to pay for the privilege of going to work. Now they want us to pay double for a train that we won't ride, subsidizing people who are as well off as we are. (0155, 0155-T –1)

Public Comment: The rail financing plan calls for turning the Dulles Toll Road into a bank by raising fares to $2.25 and use this for transit that will not service more than a fraction of commuters. It is unprecedented to use toll increases to finance Metrorail. This has never been done in Virginia and could lead to a situation where motorists are being asked to foot the bill for other transit projects. (0112, 0462-L –10)

Public Comment: But the Metrorail alternatives require raising tolls on the Toll Road to $2.25 each way and imposing a Special Tax District, raising the "BPOL" tax that businesses (like mine) pay in Loudoun, and possibly passage of the Sales Tax Referendum. Could there be a worse time to raise taxes and tolls

for a project that costs ten times more than is necessary? The economy is in turmoil, business activity is down, unemployment is rising, and 13 million square feet of office space stands vacant in the Dulles Corridor. (0112, 0462-L –34)

Public Comment: The Commonwealth of Virginia share of the capital investment does not appear to be balanced on a cost-benefit basis. The user of the Dulles Toll Road (DTR) entering and exiting the Toll Road at the Hunter Mill Road, Wiehle Avenue, Reston Parkway, Fairfax County Parkway, and Centerville Road interchanges paid for the construction and expansion of the Dulles Roll Road. These same users are now expected to pay a disproportionately larger share of the costs of the DCRTF. The EIS does not provide and data on the use of excess DTR receipts to date. As substantial excess toll funds have been realized from the DTR and state statute precludes the use of these funds for other than Dulles Corridor transit projects, an accounting of the surplus funds expended to date is needed. (0427, 0427-E –6)

Public Comment: But there also is a bad precedent to use toll revenue for Metro. Tolls have never been used for rail transit expansion in Virginia. The Dulles Toll Road is nearly paid off. By raising tolls and maintaining them after 2015 when they were supposed to be eliminated, a system that will not alleviate congestion in this corridor will be financed on the backs of motorists and commercial property owners, most of whom will not benefit. Using a great facility such as the Dulles Toll Road to finance WMATA's rail program would put the Commonwealth of Virginia on a slippery slope - where toll and gas revenue is being robbed for highways to pay for transit programs that service a small minority. (0112, 0462-L –35)

Public Comment: The proposal to double the cost of the tolls on the Dulles Toll Road to provide funding for the state share of the cost of rail through the corridor seems exorbitant since current tolls are already providing a surplus. Rationale: There are currently excess funds from Dulles Corridor tolls that could be applied to the rail project. Also, increasing/doubling the tolls may cause users to find travel alternatives on other congested roads. (0402, 0402-L –4)

Public Comment: We believe that a refinanced Dulles toll road bond program can provide in excess of one half billion dollars. This will reduce the required additional state share to an amount that should not be difficult to fund from statewide transportation funding sources. If this were done, the total sate share that would be funded from statewide sources (as distinct from Dulles toll revenues) would still be well below the statewide share of economic benefits that are forecast in the DEIS (about 42% according to Chapter 5, pages 5-8 to 5-11 of the DEIS). (0478, 0484-E –12)

Public Comment: What I would like to say is while I think that some sort of transportation alternative is necessary, I am concerned with the idea of funding it through the Dulles Toll Road. (0262, 0262-T –1)

Public Comment: There is no other metrorail area that pays a similar premium. There is not a toll on I-66 or Wilson Boulevard, nor will there probably ever be. To equal the amount I currently pay for each round trip I take, which is $4.50, in the proposed half cent tax I would have to spend $900 for each round trip, and I really can't -- when the Dulles toll road first came in, were told that toll would be removed eventually, and in fact it's been extended continuously. (0262, 0262-T –2)

Public Comment: I am very concerned about the proposal to increase tolls on the Dulles Toll Road. Many residents have no viable alternative to using to Toll Road and will be financially impacted by an increase. (0273, 0273-L –2)

Public Comment: A big part of the project's cost, as I understand it, will be funded by increasing the tolls on the Dulles Toll Road. Round-trip travel from the Beltway to Reston would increase from $1.50 to $3.50. And who bears the burden of this cost? The low to moderate-income workers traveling from other areas in the region. These people are not rich. Many of them live from paycheck to paycheck. It discourages them from working in this area, and even more of a problem is it places an unfair burden on area employers to find suitable candidates from positions. Already many of these workers have had to pull out their maps to look for residential secondary streets to use to get to work in Reston. They have to. They can't afford to pay higher tolls. (0183, 0183-T –4)

Public Comment: I would like to see mitigation of tolls esp. for moderate-income people… (why not give them a break?) if possible. (0291, 0291-L –2)

Public Comment: The Toll Road users should have their fees go only toward maintaining and improving the road, including new lanes for the express buses (also available to car/vanpools). Since transit is by nature "public", taxpayers should agree to pay for the construction if they want it and users should thereafter pay to keep it running. If neither can do so, it doesn't have the support it needs and can quickly relegated to history. (0299, 0299-E –3)

Public Comment: What is this going to mean on the cost side? Well, they are going to double tolls on the Toll Road. The annual subsidies are going to amount to approximately $200 per individual taxpayer in Fairfax per year for the indefinite future, and the triple threat is another half-cent sales tax is going to help go finance this thing. We don't need any of that if we do BRT. (0184, 0184-T-6)
Public Comment: The Dulles access fee goes up to $1.75 in each direction, or a round trip of $3.50 per trip, when we were promised years ago that the Dulles toll would go away. (0252, 0252-T –2)

> ***Response****: The Commonwealth Transportation Board (CTB) amended its policy in September 2001 to reserve a minimum of 85 percent of excess Dulles Toll Road revenues for public transportation.*
>
> *To fund the Commonwealth's share of the Wiehle Avenue Extension with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations for the Wiehle Avenue Extension. A final decision on the revised toll structure will be made by the CTB after the completion of a formal traffic and revenue study and its administrative review process. Any approved toll increases would be implemented in advance of construction to begin building reserves for the project.*
>
> *The Final EIS does not provide any information on the use of excess Dulles Toll Road revenues that are not dedicated to the Wiehle Avenue Extension. That information can be obtained through the Virginia Department of Transportation. Dulles Greenway toll revenues are not part of the Project's capital funding strategy.*
>
> *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding. If it had passed, the Project's financial analysis would have been updated accordingly.*
>
> *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension.*

Public Comment: Funding should be from general funds and fed. dollars. Strongly oppose increasing tolls to build the rail system. General funds and Metro user fees should be the policy. (0090, 0090-CC-2)

> ***Response:*** *General funds are a potential funding source for both Loudoun and Fairfax counties.*

Public Comment: What would happen if all or a greater portion of the anticipated users of the Toll Road were to shift their mode of transportation to a DCRTF? Where would the required revenue to retire the construction bonds then be realized? (0427, 0427-E –8)

> ***Response****: While the Dulles Toll Road operates at a surplus, the Metrorail system operates at a deficit. Diverting Toll Road users to Metrorail would lower the deficit but could not generate net revenues for the Project.*

Public Comment: We recommend that the state share of the Dulles Rail Now alternative not include revenues from any toll increase before rail service begins. In the Financial Analysis chapter of the DEIS, three possible scenarios are described on pages 8-9 and 8-10: (a) one involving refinancing of the bond program with no toll increase, which generates an estimated $200 million, much more than enough to fund the entire state share of the BRT alternative, (b) a program involving a 25 cent increase in tolls in 2003 and another 25 cent increase every 3 years through 2015, generating an estimated $725 million, approximately enough to fund the state share of the Metrorail Alternative, and (c) a program involving a 50 cent increase in tolls in 2003 and another 25 cent increase every 3 years through 2015, generating an estimated $800 million, approximately enough to fund the entire state share of the Phased Implementation Alternative. (0478, 0484-E –10)

Public Comment: One acceptable scenario is to initiate 25 cent toll increase at the Tysons toll barrier in 2006 or when rail service to Tysons begins. It is not fair to Dulles toll road users to begin paying an increase in tolls until they receive some benefit in relief of congestion and associated environmental benefits. We also recommend that tolls not be increased beyond Tysons until rail service is extended beyond Tysons. (0478,0484-E –11)

> ***Response****: For the Wiehle Avenue Extension, the Commonwealth of Virginia is currently conducting a rate adjustment study for the Dulles Toll Road. This study will evaluate various tolling options and be used to secure financing supported by the Dulles Toll Road revenues. The results of the study and formal recommendations are expected in late 2004. Following this, a final decision on a revised toll structure would be made by the CTB. Any approved toll increases would be implemented in advance of construction to begin building reserves for the project.*

Tax Legislation to Provide Project Funding

Public Comment: This area should not be taxed extra (or in exclusion of the entire state). *This has been the developers' plan from the beginning. Who runs this state anyhow? I am disappointed in our new governor. (0006, 0236-L –3)

Public Comment: Without rail there will be no tax district(s) and without the tax district(s) there will be no rail. (0154, 0225-M –10)

Public Comment: We are concerned that the preliminary metrorail funding plan assumes commercial property owners pay up to $400 million in the form of a tax district in order to fund Fairfax County's allocated portion of the capital costs. To quote Mr. Kenneth Klinge from the Commonwealth Transportation Board in a prior presentation, "No tax district, no rail." As one of the largest property owners in the potential tax district, we are alarmed by the undue burden this proposed tax might create. We project that such a district is unlikely to be created because it provides such a disparate benefit to the members who in turn must voluntarily petition for its creation. A building owner located close to the Metro station will receive increased density credits and likely higher rental income for his property. Owners not within walking distance will receive no such benefit but by statute would pay the same additional tax to fund the system. Also what about the owners already in the Route 28 tax district? Would they pay two special taxes? (0139, 0139-T –5)

Public Comment: The burden on properties in the potential [tax] district is up to 40 cents per 100 of assessed value, according to the enabling legislation. By way of example, this tax would increase costs by 1.5 million per year for Prentiss Properties, an increase of 10 percent in our overall operating expenses. Such an increase is punitive and will serve to weaken the competitive position of property owners in the district versus Arlington County and Maryland, where metrorail service is provided at no cost to the property owner. We find it unlikely that such a tax district can be formed which will provide fair and equitable cost versus benefit for the diverse membership. (0139, 0139-T –6)

Public Comment: If an increase in the Sales Tax is voted, how much money is expected to be used from this source of revenue? (0427, 0427-E –9)

Public Comment: Virtually no one believes that the referendum will solve our transportation crisis. Remember the existing Metrorail has an unfounded capital requirement over the next 25 years of $4.5 billion. Where is the planning for this? The reckless financial planning that brought us Enron and WorldCom are what is bringing us the sales tax referendum and the planning for the Dulles rail project. The referendum legislation now allows government to sell tax-supported bonds without having to hold a bond referendum. (0140, 0200-E –6) (0140, 0140-T-5)

Public Comment: The reckless financial planning that brought us Enron and WorldCom is what is bringing us the sales tax referendum and the planning for the Dulles rail project. The referendum legislation now allows government to sell tax-supported bonds without holding a referendum. The irony is that while transportation budgets are being slashed, our taxes are mushrooming. To get elected in 1999, the chairman of the board of supervisors told the press that taxes would not be raised. Since that statement was made, real estate taxes for the typical Fairfax County household have increased $900 in three yrs. (0140, 0140-T –6)

Public Comment: Support the landowners' interest in assisting with financing through a special tax district and acknowledge the role the transportation referendum can plan in helping provide the local share of the project's capital costs. (0396, 0396-L –4)

Public Comment: Support the establishment of a Transportation Tax District along the corridor to be served to provide the local share of funding for the rapid transit project. The beneficiaries of the new system must provide adequate funding support. The existence of one or more Tax Districts and the expected contributions must be established so that any additional Fairfax County contribution can be determined. Rationale: The November 2002 referendum includes $350 million for Dulles Corridor rail. Should the referendum not be successful, then an alternative local revenue source will be needed. The Tax District(s) must ensure no shortfall in funding, as in the case of the Route 28 Tax District, where other Northern Virginia VDOT projects have been delayed to offset the District funding shortfalls in paying the debt service. (0402, 0402-L –3)

Public Comment: The Draft EIS suggests that the Fairfax County share of the project cost might be provided by one or more Tax Districts. Should there be District funding shortfalls, there is no indication of how this would be remedied. Rationale: The Tax District that was to have funded Route 28 improvements could not meet its obligations, necessitating other Northern Virginia projects to be delayed so their funding could make up the District funding shortfalls. (0402, 0402-L –5)

Public Comment: I also would just like to correct something that one of the persons who spoke earlier tonight in regard to Loudoun County supervisors being against a sales tax which he purported to support this project. I believe, if I am not mistaken, that the Loudoun County Board of Supervisors actually voted in favor of that. (0265, 0265-T –3)

Public Comment: If Metro is selected - I will definitely vote against the sales tax increase because if you throw your money down the drain today, you'll probably do it tomorrow. (0294, 0294-E –5)

Public Comment: The substantial tax burden and toll use charges are not adequately addressed in the Draft EIS. (0510 8-2)

> ***Response****: The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project capital funding.*
>
> *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. The tax levy will be only upon commercial and industrial*

properties within the district. Although payments will not be due until December 2004, on July 1, 2004, Fairfax County began charging commercial landowners an additional 22 cents per $100 of assessed value for their properties on top of the base real estate tax rate of $1.13. Fairfax County projects that the tax rate could eventually increase to 29 cents per $100 of assessed value once a Full Funding Grant Agreement is reached. The actual levy will be established each year based on current assessments and the amount of outstanding debt. The district, which had an assessed value of $6.8 billion in June 2004, is expected to generate up to $400 million for the construction of the Wiehle Avenue Extension. If Transportation Improvement District revenues are not sufficient, Fairfax County may consider supporting its capital obligations for the Wiehle Avenue Extension using general obligation debt.

A new landowner's group, called the Western Alliance for Rail to Dulles (WARD), has formed to explore the potential of developing another tax district, similar to the Dulles Rail Transportation Improvement District, which would include properties within Fairfax County west of Wiehle Avenue. WARD has drafted a petition and began circulating it among landowners in July 2004. A determination regarding overlap within the Route 28 tax district would be addressed by WARD and Fairfax County. Property owners within the second district will be able to comment on that district's details during the Fairfax County hearing process.

Public Comment: The LEADER board of directors represents businesses in the Dulles corridor which collectively own about 40 percent of the commercially and industrially zoned land in the corridor, and the LEADER board has accepted the charge of the Commonwealth of VA and the County of Fairfax to petition the county to assemble one or more districts along the corridor for the purposes of levying a tax assessment which will finance all or a portion of Fairfax County's share of the cost of building metrorail in the Dulles corridor. (0154, 0154-T –2)

Public Comment: Additionally, LEADER has obtained expressions of support for the creation of the tax district and the construction of metrorail from several other commercial landowners in the corridor. Collectively these landowners and the LEADER board of directions represent approximately 60 percent of the commercially and industrially zoned land in the corridor. By law, the petition, when submitted to the Fairfax County board of supervisors, must bear the signatures of the owners of at least 51 percent of the commercially and industrially zoned land within the proposed district. (0154, 0154-T –3) (0154, 0225-M –3)

Public Comment: The LEADER Board of Directors, representatives of 30 businesses in the Dulles Corridor -- from the eastern edge of Fairfax County to the western border of the county - which own collectively nearly 40 percent of the commercially and industrially zoned land in the corridor, has accepted the charge of the Commonwealth of Virginia and the County of Fairfax to petition the county to assemble one or more districts along the corridor for the purpose of levying a tax assessment which will finance all or a portion of Fairfax County's share of the cost of building Metrorail in the Dulles Corridor. (0154, 0225-M –2)

Public Comment: The LEADER board of directors is comprised of representatives of businesses in the corridor form the eastern edge of Fairfax County to the western border of the County. These businesses collectively own 40 percent of the commercially and industrially zoned land in the corridor. The board of directors of LEADER has been created to consider drafted a petition which will assemble one or more districts along the corridor for the purposes of levying a tax assessment which will finance all or a portion of Fairfax County's share of the cost of building metrorail in the Dulles Corridor. By law the petition, when submitted to the Fairfax County Board of Supervisors, must bear the signatures of 51 percent at least of the commercially and industrially zoned landowners within the district. (0154, 0182-T –2)

Response: *The Project Team recognizes the important role that LEADER and the business community have had in the development of the financial plan of the Dulles Corridor Rapid Transit Project.*

Public Comment: In particular: We wish to know if the sponsorship of the current public-private partnership will wish to continue if the final choice is Bus Rapid Transit combined with Private Transit, with no firm commitment to the wasteful extension of rail beyond Tysons Corner. We suspect that, contrary to the PR campaign, BRT is being pooh-poohed as only an interim step to rail, and that BRT will not happen without the imposition of an unneeded special tax district and the delegation of the ability to raise taxes therein and also on the toll road arbitrarily. (0162, 0162-M –11)

Response: *The selected LPA is the Metrorail Extension. Its first phase, the Wiehle Avenue Extension, will have Corridor express bus service for the remainder of the LPA. FTA has approved DRPT's entry into preliminary engineering. DRPT has engaged Dulles Transit Partners under the PPTA legislation to be its consultant for preliminary engineering services. See above responses and Chapter 8 of the Final EIS on the creation of a transportation improvement district and on the use of excess revenues of the Dulles Toll Road as part of the capital funding strategy for the Metrorail Extension.*

Public Comment: Relying on creation of a special taxing district is not "stable and dependable financing." Most developers in the special taxing district are not going to be prime beneficiaries of "bonus densities." Furthermore, to raise $152 million in Loudoun County from the "BPOL" tax is absurd. At present, there is 13 million square feet of empty office space in the Dulles corridor. A tax increase would be a real killer. Some of WMATA's assumptions for inflation also are dubious. In contrast, BRT costs $3 billion less. BRT is estimated to cost $300 to $400 million, and WMATA includes unnecessary features that could be eliminated and fails to consider other alignments outside the Dulles Access Road, which could facilitate ridership. (0112, 0462-L –11)

Response*: Section 8.1.2.3 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension.*

Loudoun County presently funds the local share of transportation projects through the use of the local gasoline tax and the Business Professional and Occupancy License (BPOL) revenue. In FY 2004, the adopted six-year Capital Improvement Plan (CIP) allocated $1.9 million from the County Public Transportation Fund and $23 million from BPOL pledge bonds for FY 2005-2010 to the Dulles Corridor Rapid Transit Project. Loudoun County is proposing the use of these funding sources for its share of the full LPA capital costs.

Public Comment: I hope that the project will move forward expeditiously. I am willing to pay my fair share of the cost through increases in toll road fees, local sales tax increase, and by other appropriate means. (0194, 0194-T –6)

Response: *Comment noted.*

Operating Subsidies

Public Comment: The Dulles Corridor rail system may offer the best possible opportunity, within the overall regional rail system, for reducing the operating subsidy requirement, and possibly eliminating it entirely or making the system profitable, at least on an operating and maintenance cost basis. The reasons for this include (a) the Dulles corridor line might possibly be operated as a separate, but fully-integrated system under state control, so that key factors affecting operating costs such as fare policy, parking pricing, station design and operation, air-rights development, and provisions for station access and control could more readily be used to achieve this goal, (b) the corridor has more jobs than any other suburban corridor and therefore has the potential to attract more reverse commuters, which produces significant additional revenue without any significant operating cost increase (i.e. it fills the nearly empty return trips), (c) the two counties have begun adopting policies to encourage mixed-use-transit-oriented development, which will attract much more reverse commuting and off peak transit use, again creating

significant additional revenue without any significant operating cost increase, (d) the Dulles tolls largely avoid the subsidy of motor vehicle usage, particularly during peak periods, thus encouraging greater transit use, (e) the Dulles Toll Road offers the possibility of initiating peak period pricing in order to both eliminate peak period congestion and further encourage transit use, and (f) the residents and property owners of the Dulles corridor have begun to recognize the potential community benefit of air-rights development, which can create opportunities for much greater transit-oriented development than at other sites, thus further enhancing transit ridership, particularly during off-peak periods and in the reverse peak direction. We recommend that each of the two counties join with the Dulles Corridor Rapid Transit Project to establish a working group charged with developing a range of strategies to achieve the goal or reducing operating subsidies in the near-term and eliminating them entirely and creating a profitable system in the long-term. (0478, 0484-E –20)

> ***Response****: The LPA, as a seamless Metrorail Extension, will be fully integrated into the WMATA Adopted Regional System with respect to fare structure and revenue collection; operations, maintenance and related costs; and subsidy allocation and payment. The system and any extension will operate at a deficit, despite continued ridership growth, including reverse commuting.*
>
> *While DRPT is the project sponsor and initial owner, its intent is to lease the Extension to WMATA for operations and maintenance, and later to convey ownership to WMATA. The two counties will be the beneficiaries of higher tax assessments due to induced development and might use the additional assessments to offset their allocation of subsidy.*
>
> *With respect to air rights development above Metrorail stations, the Project Team acknowledges that the two Counties govern land use and that FAA, MWAA, VDOT and TRIP II, as the owners and operators of the DIAAH, Dulles Toll Road and Dulles Greenway, must be involved. Therefore, the Project Team will await any initiative of the two Counties with the involvement of the highway owners and operators.*

Public Comment: Have you surveyed the potential users to determine if they are willing to pay the fare required to break even? Your data implies the fare must be at least $7 a ride for buses and $11 a ride for rail. (0166, 0166-T –2)

> ***Response:*** *The LPA as a seamless Metrorail Extension will be fully integrated into the WMATA Adopted Regional System with respect to fare structure and revenue collection. In the analysis in support of the Final EIS, Metrorail fares and station parking fees are assumed to increase every 3 years at the 3-year average of the Consumer Price Index. As such, the system and the extension will operate at a considerable deficit and never cover costs with revenue.*

Public Comment: At present rates of fare, except for the artificial fare "cap", Dulles Rail Line revenues should approximate $61 million per year, including station parking and minimal station and car advertising. This will result in an incremental revenue-to-cost ratio of 91 percent, one of the highest such ratios anywhere in North America, if not the highest. MetroBus earns a revenue-to-cost ratio of only 35% (which is above average) and Fairfax Connector and Ride-On in the suburbs earn only 25 percent. In other words, the Dulles MetroRail line will need only ten cents of subsidy for every dollar of fares. Fairfax Connector (or Ride-On) needs $3 of subsidy for every dollar of fares. That is a stark contrast. It should be understood that many highly rated bus systems, such as Houston or Seattle do no better. Buses are the low cost mode for light travel because of rail's high fixed cost, but for higher volumes of travel, rail becomes the lowest cost mode. (0013, 0013-L –34)

> ***Response****: Fare box recovery is the ratio of total annual revenue over annual operating costs. The LPA as a Metrorail Extension will have lower fare box recovery than the Metrorail system as a whole. The Metrorail system does have a higher fare box recovery than Metrobus system.. Tables 8.2-1 and 8.2-2 of the Final EIS present operating cost and revenue estimates for the two Build Alternatives in the opening year and forecast year (2025) in year-of-expenditure dollars.*

Public Comment: I am completely bewildered by the acceptance by quite a few people in our country of that concept that rail should be self-supporting. We know the enormous subsidy that we give and have given to cars and roads, and we know the enormous subsidies that we give to planes and airports. Why in the world should we think that rail is self-supporting? It isn't in most places, and shouldn't be. (0195, 0195-T –1)

> ***Response:*** *The comment is correct. The LPA as a seamless Metrorail Extension will be fully integrated into the WMATA Adopted Regional System with respect to fare structure and revenue collection; operations, maintenance and related costs; and subsidy allocation and payment. The system and any extension will operate at a deficit, despite continued ridership growth.*

Passenger Facility Charges

Public Comment: It may be concluded that the DCRTF will offer a substantial savings to those passengers selecting to transit to DC by rail. This amounts to a subsidy by the residents/businesses of the Dulles Corridor for DIA passengers. It is suggested that the MWAA be authorized to collect an additional amount of the $3.00 (or more) per passenger that would contribute $80M per year to defray the construction and O&M costs. This would permit the elimination of the projected increase in toll road fees, as well as provide and improved assurance to retire the bonds. (0427, 0427-E –11)

> ***Response****: MWAA is proposing the use of Passenger Facility Charges (PFC's) as a revenue source for the capital funding for the Dulles Corridor Rapid Transit Project. This is currently $4.50 per airline passenger. FAA allows the use of PFC for airport-related facility costs, such as contributions toward transit projects to serve the airport. The Federal Aviation Administration would not allow airport revenues to be used for operations and maintenance expenses or for non-airport purposes, such as eliminating the proposed Toll Road fees.*

Capital Costs

Public Comment: The sooner you get the approval & implementation the cheaper the cost will be and the public will use it. (0070, 0070-CC-2)

> ***Response:*** *Comment noted.*

Public Comment: VDR&PT must do more with value engineering for the Dulles Rail Project. It should not cost more than $2.69 billion for completion by 2010. Half a billion must be taken out of the DEIS estimates. It is not necessary to buy enough cars for 2025. Sufficient cars for 2010 will suffice as MetroRail will be buying cars continually as the 1976 Rohr cars wear out. (0013, 0013-L –2)

Public Comment: Given that MetroRail is the only practical choice, it is necessary to construct it at the least possible quality cost and operate it much more cost effectively than proposed in the DEIS. With the mid-year of construction 2008, construction costs will have risen 38.5 percent over the cost of the Springfield-Franconia extension of MetroRail.

With 24 miles, Dulles MetroRail should cost $1.1 billion plus $627 million for stations, $48 million for ground level parking, $51 million for garage parking, $167 million for subway and elevated construction in Tyson's Corner for Route T-9, $132 million for shops and yards, $265 million for cars and $300 million for contingencies, a grand total of $2.69 billion should be the limit, saving up to half a billion dollars under some of the estimates in the DEIS.

The annual cost of the project over its cycle should not exceed $67.3 million which is estimated to average 23 cents per passenger-mile. With an equal or lesser amount for operating expenses, the total cost of 46 cents per passenger-mile is far below MetroBus or Ride-On costs of 75 cents per passenger-mile including capital. The difference of 29 cents per passenger-mile is worth about $87 million per year in favor of MetroRail. (0013, 0013-L –26)

Response: *The capital cost estimates of the two Build Alternatives of the Final EIS were based on the project's final General Plans and include right-of-way, station and line facilities, service & inspection yards, vehicles, contingency and soft costs. The estimates of capital costs will be updated during preliminary engineering. A value planning process is currently underway during the start of preliminary engineering; a value engineering process will be undertaken during the end of preliminary engineering. Both processes seek to reduce the capital costs. The Project's procurement of rail cars will be for the opening years and not for the forecast year of 2025.*

The operating and maintenance cost estimates of the two Build Alternatives were based on the WMATA cost model, which uses input from the operating plan and ridership forecasts. The operating costs and revenues in the Final EIS allow comparison with the No-Build Alternative. Comparison of the cost per passenger mile is not the basis to predict savings.

Public Comment: Number two, the cost of rail has been complained of and yet the cost of this project is in the range of other major transportation projects such as widening the beltway, proposed Interstate 81 improvements in southwest Virginia, even the Woodrow Wilson Bridge project. The Airports Authority plans improvements in the same range of costs for Dulles airport. Thus, the scale of costs we are discussing is not out of line with other major transportation projects that provide none of the smart growth benefits that occur with the rail, and the cost will be a lot higher in the future if we delay. (0144, 0144-T – 4)

Response: *The commenter is correct that each of the referenced projects is a major investment. The Project does offer the potential to provide Smart Growth benefits to the corridor.*

Public Comment: How much per mile would the extension of transit cost? I have heard $100 million per mile, and I have also heard that it could be $130 million per mile. (0147, 0147-T –9)

Response: *The Wiehle Avenue Extension is currently estimated to cost $131 million per mile and the . Full LPA is $150 million per mile (in year of expenditure dollars), exclusive of any required financing costs. .*

Public Comment: If the bridge associated with the Tysons West Station is only to be used with the BRT phase of the rail extension, why are the costs associated with the acquisition of right-of-way and construction not considered "sunk costs," rather than "capitalized" costs? (0135, 0391-L –20)

Public Comment: We do not believe the costs or impacts of the bridge, or the elimination of the private access easement across the Templeton Property, were considered or evaluated as part of the DEIS, despite the potential harm to a woman-owned small business that is the primary revenue source for its owners. Accordingly, we respectfully contend that the DEIS is inaccurate in its representations concerning the displacement of business and the costs of constructing the BRT facilities under the BRT/Metrorail and Phased Implementation alternatives (including the $194 million in "sunk costs"). (0135, 0391-L –8)

Public Comment: TMS is concerned that the so-called sunk costs associated with BRT are not fully accounted for in the $194 million figure cited in the DEIS. Our concern is that the costs are much higher than that. For example, there is proposed a bridge connection from the Tysons West parking structure for BRT buses to access the toll road access road for the BRT buses running up and down the Dulles corridor. It's a 50-foot right of way to be constructed. It's designed to appear in function like the numerous bridges and overpasses that are now dotting the landscape in the Springfield mixing bowl area, and would provide BRT buses direct access to the toll road. Possibly, we think, to avoid the surface transportation impacts of the adjacent 2000-vehicle parking structure. While it's a laudable goal to provide access for the BRT buses to the access road, in the abstract, it complicates other goals of the project. We note that the costs of constructing this bridge are not included in the sunk costs but are instead capitalized costs, as we understand it, under the DEIS. (0135, 0135-T –4)

***Response**: The bridge to and from the Dulles International Airport Access Highway and Tysons West is included as a cost and right-of-way requirement associated with the BRT/Metrorail and Phased Implementation Alternatives only, which were evaluated in the Draft EIS but were not carried forward in the Final EIS.*

Public Comment: Capital cost estimates should be re-examined in great detail by a team of engineers that are entirely independent of DRPT and WMATA. The work could be overseen by COG/TPB staff, or some other independent, respected organization, and must be free of interference and spin by WMATA. Substantially more work must be done to answer questions that raised above, such as alternatives to financing if tolls cannot be raised and if the special taxing district fails to reach a mandatory 51% vote majority of commercial property owners. (0112, 0462-L –38)

***Response**: The DPRT consultant for preliminary engineering, Dulles Transit Partners, will prepare a new estimate of capital costs for the two Build Alternatives of the Final EIS at the end of preliminary engineering, will prepare a firm, fixed price proposal for the design/build contract of the Wiehle Avenue Extension.*

Public Comment: We request a financing plan for parking related to this [project] and the spillover effect of traffic. (0184, 0184-T –18)

***Response:** All parking and related roadway modifications for station access are included in the project's capital cost estimates, which is the major input to the capital funding strategy. Section 8.1 of the Final EIS lists the major categories of the Project's capital cost estimate.*

Need for Cost Comparison of Alternatives

Public Comment: We request that the next round of the study produce a matrix showing a comparison of the lowest cost alternatives for transit in the Dulles Corridor. In order to calculate this matrix, it will be necessary to place monetary value on commuter time, which should be explicitly stated. (0162, 0162-M –13)

Public Comment: We request that an extra study produce a matrix showing a comparison of lowest cost alternatives for transit in the Dulles corridor. (0184, 0184-T –10)

Response: The consideration of alternatives commenced with alternatives from past studies and those suggested during the formal scooping process of Summer 2000. These were reduced in number through initial and interim screening. The alternatives that were fully evaluated in the Draft EIS were those that best fulfilled the goals and objectives of the Project and the needs of the Corridor. Therefore, not all low cost transit alternatives are in the Draft EIS. The Project's Final Alternatives Analysis Report does offer a review of other transit alternatives, such as light rail or personal rapid transit, that the Team eliminated from consideration during screening.

Other Potential Sources of Funding

Public Comment: But bus rapid transit is not only a faster mode of travel but the lanes used for BRT can be used for HOV and "HOT" lanes. This means motorists who want to drive alone can pay a fee to use these lanes, thus defraying some of the costs. Plus, HOV and vanpooling has proven successful in the D.C. area, particularly in reduction of cars on the road. (0112, 0269-M –6)

***Response:** BRT was an alternative evaluated in the Draft EIS but not carried forward into the Final EIS. BRT would have used the lanes of the Dulles International Airport Access Highway, which is available for mass transit but not for HOV nor HOT usage.*

Public Comment: What I present here is the outlines of the program for this national transportation emergency, which is being put forward by Democratic Presidential pre-candidate Lyndon LaRouche, a program which I fully support. LaRouche is the world's most credible economist, having forecast the

demise of the scam called the New Economy, and the current depression collapse - and put forward the only alternative, an FDR-style recovery drive, based heavily upon rebuilding our national physical infrastructure. LaRouche's program begins with the recognition that our national transportation system is effectively a {public utility}, and is thus the responsibility of the Federal Government, which has a Constitutional commitment to the General Welfare of the population. To fulfill this obligation, we need billions of dollars of low-interest credit made available to public and private companies responsible for our transportation system, in the "public works" mode that Franklin Roosevelt used. (0482, 0482-E –2)

> ***Response:*** *The Project is operating on a "pay-as-you-go" financing philosophy among the Federal and non-federal funding partners. The present assumption is that the Federal participation are capital grants (New Start 5309 Grant Program), and therefore do not have to be repaid. DRPT has prepared a preliminary financial plan for the Wiehle Avenue Extension, which is reflected in Chapter 8 of the Final EIS.*

General Concern for Future Availability of Funding

Public Comment: My concern is funding and how financially there can be incentives for the public to afford the rail 10 years from now. (0070, 0070-CC-3)

> ***Response:*** *Chapter 8 of the Final EIS provides the capital and operating funding strategies of the two Build Alternatives. During its review of the DRPT final financial plan for the Wiehle Avenue Extension, FTA will evaluate the stability and reliability of the funding of infrastructure renewal of the Metrorail system and the extension.*

Public Comment: What will be the cost to level a space for a possible future station at Wolftrap? I understand from the literature that some 1700 feet of material will need to be brought in to grade the foundation at the time track is laid. Point is - how much more will it cost to allow for a station "sometime in the future?" (0060, 0060-CC-1)

> ***Response:*** *The design of the Metrorail Alternative allows a future side-platform station at Wolf Trap by creating a level track grade along the vertical alignment. Fill and retaining walls up to 20 feet in height are required in the median of the Access Road. The additional cost is estimated at over $5 million (YOE). The accommodation for a possible future station would not require any widening of the Dulles International Airport Access Highway or Dulles Toll Road, or require additional track. The future cost of a station at Wolf Trap would depend on the design of the station and the location of the stations support facilities (park-and-ride layout and size, access roads, pedestrian connections). No station design has been completed and therefore a cost estimate also has not been developed.*

Public Comment: I guess the other thing I would like to note is, you know, it's real important to get a consensus around what you want to do very quickly, because the T-21 funding comes up next year, and unless there is both a Locally Preferred Alternative and political consensus to move ahead, the next time you are eligible for funding is in six years. So if you don't - I am not downplaying in any way the legitimate concerns that have been raised here tonight, but I would urge those to move quickly to identify those concerns and bring them forward. Otherwise, you'd be in a situation where you're actually delaying any project for a minimum of six years. (0186, 0186-T –7)

> ***Response:*** *DRPT has requested that $600 million in additional New Starts funding be authorized for the Dulles Corridor Rapid Transit Project in the pending transportation reauthorization. This will be in addition to a total of $163.5 million in New Starts funding that has been appropriated for the Project through FY 2004 to support project planning, environmental review, and engineering activities and in addition to $20 million of New Starts funding expected in FY 2005.*

Costs Related to Mitigation

Public Comment: At many of the intersections it is stated that the level of service will experience deterioration even to the point this could negatively impact station access. To mitigate these negative impacts, certain improvements were identified, to include interchange improvements such as road widening of intersections and other improvements. These mitigation efforts will come with a price tag. Therefore, my request is that the conceptual cost estimates be prepared for the construction and implementation of the improvements recommended to mitigate this anticipated traffic operating condition. (0147, 0249-T –1)

Public Comment: Also, how much will it cost to widen all of these roads leading to the various stations, plus add sidewalks for pedestrian/bike access? (0112, 0382-L –23)

> ***Response:*** *The proposed roadway modifications for station access are not high in number nor in costs. The capital cost methodology for the Final EIS does not include an estimate for each modification but rather uses "top down" method, whereby an order-of-magnitude cost is determined for the modifications. Modifications of sidewalks and trails are not the responsibility of the Dulles Corridor Rapid Transit Project, but rather of the two counties and VDOT.*

Public Comment: What are the indirect impacts caused by the direct impacts? For example, with the financial deficit of VDOT, mitigation measures such as extra lanes, turn lanes, etc. will not be built. Therefore, expand on the cumulative direct impacts regarding traffic shifts, neighborhood parking, etc. (0147, 0459-L –15)

> ***Response:*** *The secondary, often defined as indirect, impacts are assessed in Chapter 9 of the Final EIS and are not related specifically to direct effects. Secondary effects are those that are caused by the Federal action, in this case construction of the Build Alternatives, but are removed in either time or distance, from the Build Alternatives. As specified in the Final EIS, the greatest potential for indirect effects are those associated with the increase in densities at the transit station areas that would be permitted. These effects include induced traffic demand, the creation of additional impervious surfaces, loss of open space, and additional demand for public services. The financial status of VDOT is not part of the consideration as it would be impossible to project for year 2025, which is the timeframe for evaluation of indirect effects; so it is not correct to assume that VDOT, or the localities involved who are most directly responsible for mitigating the effects of secondary development growth, would not be able to regulate and/or mitigate for these effects. As defined in the Final EIS, most of the indirect effects will occur in the station areas and are expected to have minimal effect on the study area.*

Costs Per Rider

Public Comment: The Automobile is the primary means of travel so must be considered as the base line for cost. The AAA, Runzheimer and Federal Bureau of Transport Statistics all agree that automobile travel costs an average of 37 cents per passenger-mile for movement plus parking plus highway investment. For the Dulles Corridor, parking for commuting will average 31 cents per passenger-mile additional and highway widening is out of sight. If a new lane of urban freeway costs $10 million a mile (very low compared to the Beltway estimates), the subsidy per passenger-mile after allowance for fuel taxes paid, will be about eight (8) cents more, a total of 76 cents per passenger-mile full cost. Metro-Rail complete will cost only 46 cents as noted on page 5. (0013, 0013-L –37)

> ***Response:*** *Comment noted.*

Public Comment: Can you also tell me the cost per rider in terms of operating and capital cost? What is the FTA target for costs per rider? (0112, 0112-E –2)

> ***Response:*** *The Federal Transit Administration has established two cost-effectiveness measures as part of its equitable evaluation of New Starts projects. As presented in Section 10.2 in the Final*

EIS, for the Wiehle Avenue Extension in year 2025 in comparison to the New Starts Baseline, the cost per new transit trip is $24.73 and the cost per user benefit hour is $18.69 to $21.08.

Need for Cost Benefit Analysis

Public Comment: How do you expect the costs and benefits of the metrorail line from Rosslyn to Vienna to compare to the actual costs and benefits? (0166, 0166-T –5)

Response: *An analysis of the existing Metrorail system between Rosslyn and Vienna was outside the scope of work for the Final EIS, was not necessary to document the potential effects of the two Build Alternatives carried forward in the Final EIS, and therefore was not conducted.*

Public Comment: Have you had an organization with absolutely no vested interest evaluate the costs and benefits of the proposed system? The current decision makers have a conflict of interest. They favor construction because their jobs are to oversee it. I think an outside agency with no vested interest should evaluate the cost-benefit analysis and include behavior changes in that analysis. (0166, 0166-T –7)

Response: *Comment noted. The evaluation of alternatives in the Draft, Supplemental Draft and Final EIS has been coordinated extensively with public agencies, and the selection of the Locally Preferred Alternative has been made by the Commonwealth Transportation Board and the WMATA Board of Directors in coordination with the Federal Transit Administration, and in cooperation with FAA, Fairfax County and Loudoun counties, Town of Herndon and MWAA.*

Public Comment: More Information on Experience of Comparable Heavy Rail Extensions. It also would be useful to know whether comparable examples exist in this country of heavy rail extensions to largely suburban areas 30 miles beyond the urban core and what their experience has been in terms of projected versus actual costs and ridership. (0446, 0446-E –7)

Response: *An analysis of comparable heavy rail extensions was not necessary to document the potential effects of the two Build Alternatives, and therefore was not conducted for the Final EIS. In addition, the existing Metrorail system extends into suburban areas throughout the region, and experience over the last 30 years has shown that the system provides substantial transportation benefits.*

Costs Related to Infrastructure Improvements

Public Comment: WMATA and VDRPT also should calculate the financial cost to the Virginia taxpayers of paying for various road and sidewalk improvements to facilitate Dulles Rail and BRT. It should be noted that most of the intersections near proposed transit stations are at levels of service of D, E or F without these road and intersection widenings. (0112, 0462-L –39)

Response: *The proposed roadway modifications for station access are not high in number nor in costs. The costs will be borne by the Project rather than by the two counties and VDOT.*

Costs Related to Widening the Dulles Toll Road

Public Comment: Finally, in the interests of a fair and complete study, you should look at the cost to simply widen the Dulles Toll Road to accommodate the traffic that would be the equivalent of the rail or BRT ridership. Such a widening would most likely pay for itself through increased toll revenues from the increased traffic volume and would, unlike Metro, not require a perpetual tax subsidy to operate. (0464, 0464-L –6)

Response*: There is little, if any, available land on either side of the Dulles Toll Road to accommodate an additional lane of traffic. The addition of a single lane would not meet the long-term capacity requirements of the corridor, nor would it meet the land-use and environmental goals outlined in the project's purpose and need.*

Public Comment: Commenter believes that an independent group that has no vested stake in the project should analyze the financial plan.(0294 8-1)

> ***Response:*** *Comment noted. The DPRT consultant for preliminary engineering, Dulles Transit Partners, will prepare a new estimate of capital costs for the two Build Alternatives of the Final EIS and, at the end of preliminary engineering, will prepare a firm, fixed price proposal for the design/build contract of the Wiehle Avenue Extension. During the preliminary engineering of the Wiehle Avenue Extension, DRPT will prepare the Extension's final financial plan, which FTA will review for financial capacity as part of negotiations for a Federal Full Funding Agreement.*

Public Comment: Did not see any reference to a public/private partnership, and expected it to be considered. (0123 8-1)

> ***Response:*** *Under the Commonwealth of Virginia Public-Private Transportation Act, as amended, DRPT has entered into a PPTA contract with Dulles Transit Partners to engineer, design and build the project. Additional information on the contract and its benefits is available at the DRPT web site, www.drpt.virginia.gov.*

Loudoun County Project Funding

Public Comment: I also would just like to correct something that one of the persons who spoke earlier tonight in regard to Loudoun County supervisors being against a sales tax which he purported to support this project. I believe, if I am not mistaken, that the Loudoun County Board of Supervisors actually voted in favor of that. (0265, 0265-T –3)

> ***Response:*** *The sales tax referendum of Fall 2002 did not pass; it would have allocated a minimum of $350 million for the Fairfax and Loudoun County shares of the Project's capital funding.*

Local Funding Source

Public Comment: My only other note that I wish to say is the fact that, since I live in Reston, the new tax that they're going to be doing as far as the Toll Road, possibly, and a sales tax-- we're paying for the rail, we've been paying for the rail through the tolls. We need to build it now. (0081, 0285-T –2)

Public Comment: What really this boils down to is who has the money and who is going to get it. (0191, 0191-T –2)

> ***Response:*** *Chapter 8 of the Final EIS provides the capital funding strategy for the two Build Alternatives.*

B. Supplemental Draf EIS Comments

Local Agency Comments

Need to Secure Adequate Project Funding

Local Comment: Has funding for the project been secured? What is the current projected time table the property in the Tysons West area will be required? (0134 8-1)

> ***Response:*** *DRPT has developed a preliminary financial plan for the Wiehle Avenue Extension, which identifies capital funding sources and shares for each of the Project's funding partners. Chapter 8 of the Final EIS reflects the preliminary financial plan*

DRPT estimates that right-of-way acquisition would be conducted from late 2005 to early 2007. A detailed acquisition plan and schedule will be developed during preliminary engineering.

Phasing Implication for Transportation Improvement District Funding

Local Comment: Moving the terminus for Phase I to Herndon-Monroe is a means to guarantee immediate value for landowners in the western end of the district. Under the current funding and construction phasing proposals, these owners face the possibility of paying taxes to support Phase I construction bonds for thirty years or more, even in the event of a failure to get Federal funding for any subsequent phase. Under the best case scenario, these owners would be taxed from 2004 through at least 2015 before seeing any transit facilities in the Herndon area.
0132 0171-1

Local Comment: In short, the proposed phasing scheme provides significant uncertainties for the implementation of a future phase. The Town Council opposes a single tax district, as proposed by the LEADER group, with the phasing scheme that does not extend the system to the Herndon-Monroe Station within the first phase.
0132 0171-02

Response: *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. The tax levy will be only upon commercial and industrial properties within the district.*

For the remainder of the Full LPA, a new landowner's group, called the Western Alliance for Rail to Dulles (WARD), has formed to explore the potential of developing another tax district, similar to the Dulles Rail Transportation Improvement District, which would include properties within Fairfax County west of Wiehle Avenue. WARD has drafted a petition and began circulating it among landowners in July 2004.

Local Comment: Please enter the attached Town Council Resolution 03-G-144 of December 2, 2003 into the public hearing record for the Draft Supplemental EIS. This resolution does support the LPA but conditions Town approval of the Transportation Improvement District on a Phase I interim terminus at Herndon-Monroe, as a means to assure rail service to the western part of the Dulles Corridor. The Herndon resolution recommends removing language that would have allowed landowners to veto Phase 2 implementation with one or more failures to obtain federal funding. The resolution also provides for minor adjustments to the boundaries of the tax district within the Town of Herndon.
0132 0171-03

Response: *Comment noted. The Herndon Town Council Resolution was added to the public hearing record for the Supplemental Draft EIS. Specific comments or questions on the transportation improvement district should be directed to the Fairfax County Board of Supervisors or Fairfax County staff.*

Public Comments

Costs Related to Widening the Dulles Toll Road

Public Comment: Again, I requested the project team address the conflicts in the Purpose & Need as stated above, particularly your outlandish statements that is cheaper to build rail in the middle of the Dulles Toll Road at $135 million a mile than to add new lanes, which could cost at a minimum $15 million a mile.

Again, I requested the project team address the conflicts in the Purpose & Need as stated above, your

build schedule for Dulles Rail vis-à-vis the Largo extension, etc. This was not done in the SDEIS hearing report. (0112 8-1)

> ***Response:*** *There is little, if any, available land on either side of the Dulles Toll Road to accommodate an additional lane of traffic. The addition of a single lane would not meet the long-term capacity requirements of the corridor, nor would it meet the land-use and environmental goals outlined in the project's purpose and need. The opening year of the first phase of the Full LPA, being the Wiehle Avenue Extension has been moved forward from 2009 to 2011.*

Concern for Cost Overruns

Public Comment: Finally, on p 119, your response to the questions about cost overruns and what happens if the project runs out of money is not satisfactory. WMATA has consistently had cost over-runs and has been criticized extensively for its failure of long range planning. Therefore, there is a lack of confidence that this project will be any different. (Jody Bennett)

> ***Response:*** *WMATA has proven itself in project delivery. For completion of its 103-mile program, opening between 1997 and 2002, WMATA was under budget by $286 million, and on-time or early by 10 months aggregate. Moreover, DRPT is primarily accountable for the cost-effective delivery of this Project as its owner and contracting authority. DRPT has entered into a PPTA contract with Dulles Transit Partners for the benefits of PPTA, which are explained at DRPT's web site, www.drpt.virginia.gov.*

Use of Toll Revenues to Fund Transit Improvements

Public Comment: Another irritant for me and thousands of others in the Reston-Herndon area is the proposal to increase tolls. In the first place, why are we the only residents of the entire Washington Metropolitan area that are burdened with tolls? How about implementing tolls on I-66? How about I-95/395? With all the millions and millions of dollars being spent on ONE interchange (Springfield), how come the residents in that area are not being charged? (0143 8-1)

> ***Response:*** *The Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act (VTA) of 2000 and Dulles Toll Road revenues. In September 2001, the Commonwealth Transportation Board (CTB) directed that a minimum of 85 percent of available revenues be dedicated to public transportation initiatives in the Dulles Corridor. To fund the Commonwealth's share of the Dulles Corridor Rapid Transit Project with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations for the Wiehle Avenue Extension. A final decision on the revised toll structure would be made by the CTB after the completion of a formal traffic and revenue study and its administrative review process.*

Use of Toll Revenues to Support Project

Public Comment: [GRCC would support] - A limited increase in tolls, parking and other user fees to help fund the state's portion of the rail project; and (0023 0024-6)

Public Comment: I am willing to pay higher tolls in the Dulles Corridor to allow the subterfuge that Virginia is paying its fair share of the Dulles Rail system. (0041 0042-3)

Public Comment: People will complain about toll increases on the Dulles Toll road. I think most people are not aware that this is coming. If this is done, no one will ever vote for a project like the Dulles Toll Road. The promise of removing the tolls should be kept. (0044 0045-4)

Public Comment: As a resident living one mile from the proposed Wiehle temporary rail terminus, I fully support the Dulles Rail plan as outlined. People don't generally support additional taxes or costs, such as increased toll road costs, but if I knew those costs were going to fund rail, it would be worth the additional costs. (0057 0058-1)

> ***Response****: The Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act (VTA) of 2000 and Dulles Toll Road revenues. In September 2001, the Commonwealth Transportation Board (CTB) directed that a minimum of 85 percent of available revenues be dedicated to public transportation initiatives in the Dulles Corridor. To fund the Commonwealth's share of the Dulles Corridor Rapid Transit Project with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations for the Wiehle Avenue Extension. A final decision on the revised toll structure would be made by the CTB after the completion of a formal traffic and revenue study and its administrative review process.*

Public Comment: Let's start with the proposal to double the tolls on the Dulles Toll Road. The burden is inequitable in that it will fall directly on those of us who live along the corridor and use the toll road. Yet the rail we are asked to fund will benefit travelers from all over the region - indeed from all over the world if it ever makes it to Dulles Airport. In fact, it appears the only reason that Wiehle Avenue was added as the terminus so late in the game was to fabricate a station in the Dulles Corridor and thus legitimize the use of the toll road monies. (0027 0028-1)

Public Comment: The financial plan as proposed has placed an unfair burden of the citizens along the Dulles corridor by the Commonwealth of Virginia. The Commonwealth should assume "all" the non federal share. This share should not include funds from the Toll Road, but should be totally funded by bonds. Just like Rt.58 and the Harbor Tunnels. (0033 0034-1)

Public Comment: Our research indicates that the Dulles Toll Road has taken $400 million in revenue since it was built for an initial cost of $55 million. It is time to get rid of full-time tolls. Let's take the pork out of politics and the tolls off the toll road. (0061 0069-14)

Public Comment: When the toll road was proposed, there was a promise to people that the tolls would be used to pay off the construction bonds. This has not happened and, to go further and increase the tolls at this point is simply, I think, a betrayal of the public trust. (0071 0080-2)

Public Comment: Furthermore, these increased tolls will provide a disincentive for people to use the toll road during hours in which congestion isn't a problem, like weekends, off-hours, middle of the day, late at night. No one is going to want to pay those tolls if they can use Route 7 or some of the back roads, Lawyer's Road, to commute east-west. (0071 0080-3)

Public Comment: Full time tolls should be taken off the Toll Road. There is enough money in the reserve funds to do this. The toll plazas should go. Confirm or deny the existence of enough money to pay off the current bonds outstanding on the Toll Road. (0061 0117-23)

> ***Response****: The Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act (VTA) of 2000 and Dulles Toll Road revenues. In September 2001, the Commonwealth Transportation Board (CTB) directed that a minimum of 85 percent of available revenues be dedicated to public transportation initiatives in the Dulles Corridor. To fund the Commonwealth's share of the Dulles Corridor Rapid Transit Project with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations*

for the Wiehle Avenue Extension. A final decision on the revised toll structure would be made by the CTB after the completion of a formal traffic and revenue study and its administrative review process.

Funding Plan Concerns

Public Comment: Here are three examples of what is unfair about the funding plan. (1) The plan raises tolls $2.00 per day per rail rider, some are even proposing $2.00 per day per automobile driver. The driver's benefit is only $0.25 per day per rail rider. (2) The plan taxes those within 2 miles of the rail line. The benefit by those who live more than one-quarter of a mile from the stations is almost zero. (3) The plan takes Federal and State funds so that wealthy Northern Virginians, especially those currently owning land near the stations, can profit. The benefit to those in Danville, Virginia, for example, who will be paying State taxes into this project is zero. (0048 0049-1)

Public Comment: Now is the time to reconstitute a funding plan which is fair and equitable to the parties involved. A taxing mechanism should be proposed which matches the benefits of service to the burden of the tax. That is just common sense and good business. We stand ready to participate in a new dialogue with the Project proponents, Fairfax County, the Town of Herndon, and property owners in the Dulles Corridor and Tysons Corner. We need new leadership to emerge to help move the funding component of this project forward. We stand ready to assist in that effort. This time, let's make it fair, equitable, and open so that it can achieve broad based support. (0028 0029-3)

***Response**: Major transportation improvements in the Washington, DC region have historically been funded through combinations of federal, state and local assistance. The Dulles Corridor Rapid Transit Project would have many beneficiaries, including users and non-users, and would contribute to regional goals for land use, mobility and access. As such, the capital funding strategy of the Wiehle Avenue Extension distributes the costs of the project among three funding partners: the federal government at 50 percent, the Commonwealth of Virginia at 25 percent and Fairfax County at 25 percent. The Commonwealth of Virginia will be responsible for funding 25 percent of the Wiehle Avenue Extension capital costs, approximately $380.4 million (YOE), using Virginia Transportation Act (VTA) of 2000 and Dulles Toll Road revenues. The majority of the Commonwealth's share would be funded through tolls on the Dulles Toll Road, and not through statewide transportation funds that would otherwise be directed to projects in other parts of the Commonwealth.*

In September 2001, the Commonwealth Transportation Board (CTB) directed that a minimum of 85 percent of available revenues be dedicated to public transportation initiatives in the Dulles Corridor. To fund the Commonwealth's share of the Dulles Corridor Rapid Transit Project with available revenues and limited use of short-term financing, a toll increase is planned. Based on an initial analysis of current traffic and growth projections, a toll of $0.75 at the main toll plaza and $0.50 at each interchange ramp toll plaza provides sufficient revenues to meet the Commonwealth's obligations for the Wiehle Avenue Extension. A final decision on the revised toll structure would be made by the CTB after the completion of a formal traffic and revenue study and its administrative review process.

Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. The tax will be levied only on commercial and industrial properties within the district. Specific comments or questions on the proposed transportation improvement district should be directed to the Fairfax County Board of Supervisors or Fairfax County staff.

Public Comment: The rest of the rail system was not paid for by tolls on roads and local tax districts. Why is it proposed for here? (0098 0114-3)

Response: *Federal funding for the construction of the initial Metrorail system was provided from sources that are no longer available. All new major fixed guideway capital investments, including extensions to the Metrorail system, are funded under FTA's New Starts (Section 5309) program. This program is discretionary and relies upon local project sponsors to contribute a significant portion of funding for proposed projects. Under current law, the maximum share of Federal funding for New Starts transit projects is 80 percent, although Federal participation of 50 percent is typical for New Starts projects. DRPT is currently seeking $760.8 million in Federal "New Starts" funding for Phase 1 of the project. This funding level represents a 50 percent share of the estimated project costs and assumes that annual Federal contributions would be maintained at a consistent and reasonable annual level through the proposed construction period. The remainder of the project costs for the Wiehle Avenue Extension would be funded by the Commonwealth of Virginia and Fairfax County. See response to the above comment.*

Public Comment: The potential costs of a rail project are substantial, and our members will bear a large portion of the funding responsibility, including potential sales tax and real estate tax increases, as well as increased tolls paid by our employees and customers; (0023 0024-2)

Response: *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA, as evaluated in the Supplemental Draft EIS.*

Public Comment: the rail proposal is so flawed that it would make financial sense to decommission the Silver Line the day it opened, even if its enormous construction costs could be magically covered. (0061 0069-1)

Response: *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA, as evaluated in the Supplemental Draft EIS.*

Public Comment: The capital investment in Dulles Rail should not be a problem. Federal law designates eighty percent federal support and Congress has increased the appropriation. True, FTA is reluctant, but Congress earmarks these grants. Utah gets sixty percent for rail. Why can't we? Even at fifty percent, Virginia has pledged 25 percent and the Airport has pledged about four percent. That leaves 21 percent for Fairfax and Loudoun counties, with 1.3 million people. The local share of $714 million is easily manageable. (0054 0090-4)

Public Comment: I think it is misleading the public to keep saying the federal government is going to pay for 50 percent of this. All that is in the application that is pending at FTA for funding is $600 million in addition to the money that Frank Wolfe has already gotten, $150 million more, $750 million. (0072 0082-6)

Response: *Under current law, the maximum share of Federal funding for New Starts transit projects is 80 percent, although Federal participation of 50 percent is more typical for New Starts projects. DRPT is currently seeking $760.8 million in Federal "New Starts" funding for the Wiehle Avenue Extension. This funding level represents a 50 percent share of the estimate Project costs, and assumes that annual Federal contributions would be maintained at a consistent and reasonable annual level through the proposed construction period. The specific amount and timing of Federal funds will be negotiated through a Full Funding Grant Agreement (FFGA) once a Record of Decision is issued and preliminary engineering is completed. Section 8.1 of the Final EIS provides the anticipated funding sources for each jurisdiction.*

Project Phasing

Public Comment: Please explain why it is necessary to justify Phase I based on the completion of Phase II, particularly when funding for Phase II is not even being considered at this time. (0063 0151-7)

> ***Response:*** *The Full LPA would be constructed in two phases in order to reduce annual Federal funding needs by spreading the construction costs over a longer period of time. At this time, the FTA is considering only the first phase of construction, the Wiehle Avenue Extension for New Starts funding from the pending six-year reauthorization of the New Starts program. FTA may consider the subsequent phase for FTA funding in the future, but has made no commitment to do so. Furthermore, FTA has determined that the first phase now being considered for funding has independent transportation utility even if the subsequent phase is never built. (The first phase serves the high employment area of Tysons Corner.) Therefore, FTA will make a decision on the funding of the first phase without regard to possible future phases.*

Public Comment: Please explain how it is in the public's interest to treat Phases I and II as separate projects for purposes of funding, but not for purposes of the NEPA analysis. Why is this not misleading, given that funding for Phase II appears unlikely? (0063 0151-8)

> ***Response:*** *See the above response on the construction phasing of the project. The Final EIS does evaluate the Full LPA as a Build Alternative since it fulfills the goals and objectives of the project more fully than the Wiehle Avenue Extension.*

Alternative Funding Approaches should be considered

Public Comment: Rail-revenue bonds could cover construction costs. Fares would cover the debt, operating and maintenance costs. Billions of taxpayer dollars would be saved, perhaps allowing funding, for example, of a DC hospital. (0048 0049-3)

> ***Response:*** *Since the Metrorail system and any Metrorail extension operates at a deficit, there are no excess fare revenues for capital financing.*

Investment per Passenger

Public Comment: The capital "cost" of Dulles Rail is NOT a cost. It is an investment. The $1.5 or $1.6 billion on grant money is $39 million per year, or $1.96 per passenger. This must be disclosed. There is no other way to get such mobility for so low a cost. (0054 0055-4)

> ***Response:*** *Comment noted. Your participation in the public hearings and your opinions regarding what you believe would best serve the needs of the Dulles Corridor and region are important to us and were considered by decision-makers in revising the LPA, as evaluated in the Supplemental Draft EIS.*

Concern about Cost of Studies and Project Development

Public Comment: Furnish an accounting for the amounts expended and the sources for the cost of the DEIS and SDEIS studies, for any future studies, and an equivalent calculation for the cost and funding of preliminary engineering. (0061 0117-18)

> ***Response:*** *The budget for the current environmental review phase of the Project is $45.6 million, of which $43.7 million has been expended through August 2004. The sources of the funds are the Federal Transit Administration and the Commonwealth of Virginia. The environmental review phase, known as the NEPA process, includes: the scoping process; early and ongoing public involvement and agency coordination; alternatives analysis; environmental, engineering and financial analyses; preparation of the Draft EIS, Supplemental Draft EIS, Final EIS, and Revised General Plans; public hearings; and a Federal Record of Decision. In addition to the above, the*

Project has also responded to the requirements of the Federal New Starts program. Under New Starts, FTA evaluates and recommends projects for Federal funding. The requirements have included the Request to Enter Preliminary Engineering, project justification criteria, preliminary financial plan, and development of supporting materials.

For the next phase of the Project, preliminary engineering of Wiehle Avenue Extension, DRPT has a budget of $68 million. This budget includes DRPT's administrative and consultant costs, WMATA's administrative and consultant costs, and costs for professional consultant services. The sources of the PE funds are the Commonwealth of Virginia and the Federal Transit Administration.

Regional Funding Needs and Impact on State and Local Funding for WMATA

Public Comment: The current metro system in Washington has a $1.5 billion emergency capital deficit, and a longterm $12 billion capital deficit. Where is Virginia's share of this money coming from? And if Dulles Rail is implemented, won't Virginia's share of both figures increase? Shouldn't these questions be asked and answered up front prior to considering Virginia's further involvement in money-losing old-transit technology? (0061 0168-3)

Public Comment: Please identify the resources and plan to upgrade the Metrorail system to be able to accommodate eight car trains. Where will the money come from, and how will the job be completed in time for the opening of the Silver Line? (0063 0151-13)

Public Comment: Explain, and forecast, how the addition of the 23 mile Silver Line will affect Fairfax County, and the State of Virginia's portion of 1) the $1.5 billion emergency capital shortfall WMATA has announced, and 2) the $12 billion long term capital program WMATA says it needs. (0061 0117-22)

Public Comment: At a recent meeting of the Dulles Corridor Steering Committee, WMATA reportedly stated that it must get its $1.5 billion in core capital funding before Dulles Rail gets built. Moreover, MWAA reportedly stated that unless there is a financial commitment to build rail to Dulles Airport, it may not allow the use of its right of way for Phase I. Clearly, this is critical information that could seriously impact the integrity and environmental impact of the project. Please explain why it was not disclosed, particularly at the December 11, 2003 public hearing, which occurred after the Dulles Corridor Steering Committee meeting. Please explain whether the information will be disclosed and whether the public will be given an additional opportunity to comment. (0063 0151-21)

Public Comment: Please explain how the project team plans to meet the contingencies set forth by WMATA and MWAA, and what alternative plans may be under consideration. For example, if MWAA refuses to grant use of its right-of-way, what other alignments may be considered? Similarly, if WMATA does not get its $1.5 billion in core capital funding, how will the project proceed without their participation? (0063 0151-22)

Response: *In preparing the Final EIS , the Project Team developed and evaluated the No-Build Alternative with the assumption that WMATA would be funding and implementing eight-car train operations to satisfy forecast demand prior to the Project. WMATA has been emphasizing to the Commonwealth of Virginia and to the Project's other funding partners the critical importance of the implementation of eight-car train operations. Under its Metro Matters campaign (see www.wmata.com/about/metro-mattersfactsheet.pdf), WMATA is presently seeking the funding of its near-term capital needs to sustain the Metrorail and Metrobus systems. Within the $1.5 billion Metro Matters campaign, there is over $600 million for the eight-car train operations. In addition, WMATA has fully informed the region's Transportation Planning Board of the near term and long-term capital needs.*

In November 2002, MWAA endorsed the Metrorail Alternative. In its December 29, 2003 letter, MWAA has stated that its continued support of the Project is subject to three conditions: 1) The FTA reauthorization process needs to recognize the ultimate goal to complete the rail line out to

and beyond Dulles Airport; 2) Advanced additional engineering must proceed beyond the initial segment and include the entire project; and 3) There needs to be a Memorandum of Understanding among the local partners that captures a joint commitment to see the entire project through to completion.

Public Comment: Remember transportation (not tons of metal) is the goal and there is an entire region to serve. Throwing a boatload of money at the Dulles Corridor will leave nothing for other areas with traffic problems just as bad or worse than Dulles. (0044 0045-5)

Response: *Section 8.1 of the Final EIS provides the capital funding strategy for the two Build Alternatives. The non-Federal funding proposed for the project would come from sources dedicated to transportation improvements in the Dulles Corridor, and would not impact available funding for projects in other areas of the Commonwealth. The regional Transportation Planning Board (TPB) approves the long-range plan of transportation projects in accord with available funding over twenty-five years. The TPB has approved the Full LPA to be part of the long-range plan. Members of the TPB include representatives of local governments; state transportation agencies; the Maryland and Virginia General Assemblies; the Washington Metropolitan Area Transit Authority; and non-voting members from the Metropolitan Washington Airports Authority and federal agencies,*

Crowd Control Measures

Public Comment: Metro is having difficulty handling the crowds they now have traveling from Vienna into downtown. What will be the impact to the present system when the projected additional riders will be added to the present system? Analyze in terms of new capital cost and operating cost that will be spent towards crowd control. (0109 0128-3)

Response: : *In preparing the Final EIS , the Project Team developed and evaluated the No-Build Alternative with the assumption that WMATA would be funding and implementing eight-car train operations to satisfy forecast demand prior to the Project. WMATA has been emphasizing to the Commonwealth of Virginia and to the Project's other funding partners the critical importance of the implementation of eight-car train operations. Under its Metro Matters campaign (see www.wmata.com/about/metro-mattersfactsheet.pdf), WMATA is presently seeking funding of its near-term capital needs to sustain the Metrorail and Metrobus systems. Within the $1.5 billion Metro Matters campaign, there is over $600 million for the eight-car train operations. In addition, WMATA has fully informed the region's Transportation Planning Board of the near term and long-term capital needs.*

How are Cost Over-Runs Handled

Public Comment: who pays for the cost-over runs? (0109 0128-22)

Public Comment: The federal government is not going to contribute one penny towards those cost overruns. All that money is going to come out of the local taxpayers, the people who ride the toll road and the people who are paying your special tax in the tax district. (0072 0082-7)

Public Comment: What happens if we run out of money? Tunneling is very expensive. (0073 0083-3)

Public Comment: Inadequate Local Financial Commitment and Financial Plan: There currently is no local financial plan in place, and to the extent one might be advanced in the future, the cooperation of commercial property owners has been to date solicited based on substantial misrepresentations of the risks of additional costs that will fall on local and state taxpayers when the Federal Government does NOT contribute "50% of the costs" as the SDEIS and the rail proponents have claimed. In fact, the Federal government has made it crystal-clear that it will not by policy advance more than the specific number of dollars to which it commits when it signs the FFGA. The Application now pending at the FTA is

for $600 Million of Federal funding, and the FTA has been very clear that it has no obligation or intent to pay 50% of whatever excess costs might occur in the future. (0072 0150-10)

Public Comment: Cost Overruns are a virtual certainty: Environmental mitigation, interest costs, geotechnical considerations, and life-safety requirements that are not anticipated are certain to dramatically increase the Project cost above the estimated amount. As one small example, the citizens are demanding sound-walls where none have been proposed. (0072 0150-11)

> ***Response:*** *Obviously, with any large complex project, schedule and cost risks are real. WMATA has proven itself in project delivery. For completion of its 103-mile program, opening between 1997 and 2002, WMATA was under budget by $286 million, and on-time or early by 10 months aggregate. Moreover, DRPT is primarily accountable for the cost-effective delivery of this Project as its owner and contracting authority. DRPT has entered into a PPTA contract with Dulles Transit Partners for the benefits of PPTA, which are explained at DRPT's web site, www.drpt.virginia.gov. Through the Federal Full Funding Grant Agreement, FTA will not participate in the funding of any cost overruns.*

Accuracy of Cost Estimates

Public Comment: A close look at these numbers reveals something very peculiar. Note the guideway estimate of 301.3 million. The 11.6 mile section included in Phase 1 has one mile of tunnel and 4 miles of elevated section, along with the remaining 6.6 miles of surface guideway. This is stated to cost 137 million less than the remaining 12.5 mile section that contains no tunnels and less than one mile of elevated section. This is obviously wrong. (0095 0111-2)

Public Comment: The cost breakdown between Phase One and Phase Two does not appear to be reasonable. Tunneling, aerial construction, and right-of-way requirements indicate a much higher level of construction cost and risk for Phase One than for Phase Two where tunneling is limited to Dulles Airport, and where most risk has been eliminated through excavation off the proposed station during the recent reconstruction of the Dulles terminal. Phase One involves five stations, Phase Two, six stations. There is no significant difference in length between the phases. Yet the proposed cost for Phase One is $1.5 billion versus $1.9 billion for Phase Two. (0108 0127-10)

> ***Response:*** *The cost estimates for both the Full LPA and Wiehle Avenue Extension are based on the project's General Plans. It should be noted that the medians of the Dulles Connector Road, Dulles Toll Road and Dulles Greenway were reserved for high-capacity transit, saving the project significant money for right-of-way and access. The remainder of the Full LPA, west of Wiehle Avenue, includes a section of underground line and station at Dulles International Airport, a major service and inspection yard and two park-and-ride structures in Loudoun County. The capital cost estimates are reported in year of expenditure dollars; therefore, expenditures in later years reflect annual inflation.*

Public Comment: The cost of the proposed LPA Phase 1 is projected to be $1.5 billion. This is not the real bottom line of cost, however, because no where in the budget is the cost of money and other financing charges. The public needs the whole story. Please revise the budget to include financing charges as well as all sources of financing. (0109 0128-20)

Public Comment: Forecasting the cost and performance of major infrastructures projects with a reasonable degree of approximation is very difficult. However, proponents, including county, state, and federal politicians, DRPT and WMATA paint a rosy picture that the federal government will pay 50%. The average citizen believes that all is needed is to dig the hole in Tysons and the federal government will pay 50% of whatever costs are incurred in all stages. However, SDEIS, 8.2.1 states, these estimates do not include the cost of financing for delays or annual shortfalls in Federal funding. (0109 0128-21)

> ***Response:*** *According to DRPT's preliminary financial plan for the Wiehle Avenue Extension, no long-term financing of any shortfall in Federal funds for the Extension is anticipated. Short-term*

financing, through a letter of credit or similar mechanism, may be required if annual Federal funding levels do not match the terms of the Full Funding Grant Agreement. As prepared during preliminary engineering, the final financial plan will provide additional detail on potential financing costs. The final terms and timing of any short-term financing would be determined once a shortfall was projected, based on market conditions existing at that time.

Because FTA is now advancing only the Wiehle Avenue Extension in the New Starts program, a detailed financing approach has not been developed for the Full LPA. A preliminary financial plan for the full LPA will be developed subsequently, when DRPT seeks approval from FTA to advance that portion of the project into preliminary engineering. As with the Wiehle Avenue Extension, a more detailed financial plan would then be developed to support an FFGA for the remainder of the full LPA.

High Cost of Proposed Improvements

Public Comment: The enormous cost is really staggering. For this option alone, the capital cost is estimated to be $1,050.4 billion excluding finance costs. The proposal calls for the Commonwealth of Virginia to be the Project sponsor furnishing 25% or $262.6 million and Fairfax County furnishing 25% or $262.6 million for this option. The total Federal share 50% or $525.2 million. Considering the huge current funding deficits, the large costs for the Woodrow Wilson Bridge and the Mixing Bowl, and the failure of the transportation tax increase in Northern Virginia, it does not appear to be wise to pursue such an undertaking. (0102 0119-1)

Response: *The project's capital cost estimates are comparable with projects of this size and are based on a methodology appropriate with the design stage of the Final EIS and the final General Plans. Section 8.1 of the Final EIS provides the capital funding strategy of the two Build Alternatives. Section 8.3 of the Final EIS provides an initial discussion of risks and uncertainties. The ultimate cost of the Build Alternatives relies on a number of assumptions, including project schedule, major cost drivers, inflation rates, expenditure forecast, funding availability, and financing requirements. During the project's next phase of preliminary engineering, DRPT will prepare the final financial plan, which will include an update of the capital cost estimate and a formal risk assessment.*

Cost and Funding of Mitigations

Public Comment: What is the cost for each proposed mitigation option that is identified in, Table 6.2-7? (SDEIS, 6-22) (0107 0125-1)

Public Comment: Proposed mitigation measures for LPA and the LPA Phase 1 are identified, however, the DEIS and the SDEIS are silent in regards to cost and funding sources. This information should have been provided to the public prior to the hearings and comment periods. What is the cost for each mitigation measure and what is the funding source? Please do not justify your response by stating that during the PE this information will be available. The whole point of the NEPA process is to get in early with all available data and that data to undergo a rigorous analysis. This includes reporting all impacts, including the financial impacts that some agency (probably the citizens) will have to shoulder. (0109 0128-23)

Public Comment What is the funding source for each of the proposed mitigation options? (0107 0125-2)

Public Comment: Is the funding of the proposed mitigation options part of the cost over-runs that we are to expect from this megaproject? (0107 0125-3)

Response: *The proposed roadway modifications for station access are not high in number nor in costs. The capital cost methodology for the Final EIS does not include an estimate for each modification but rather uses "top down" method, whereby an order-of-magnitude cost is*

determined for the modifications. This method was also applied to environmental mitigation measures.

More Detailed Costs

Public Comment: A defensible breakdown of cost data – both capital costs and annual O&M costs – needs to be evaluated in the SDEIS. This is particularly needed in light of the huge costs and funding sought (e.g., $1,500,000,000.00 in capital costs (YOE) for Phase 1, with $48,700,000.00 in annual O&M costs (YOE), plus Phase 2-total projected capital costs of $3,400,000,000.00 (YOE) and $101,600,000.00 in annual O&M costs (YOE). (0068 0173-16)

Response: *The Project Team has two Technical Memoranda, Capital Cost Methodology and Metrorail Operating Subsidy, to record the determination of capital and operating costs. Since these are not public documents, they may be viewed at the Project office.*

Concerns about Local Taxing District and Local Funding

Public Comment: I WANT TO INFORM YOU THAT I WANT THE COUNCIL VOTE TO AMEND THE ORIGINAL PETITION, OR VOTE NO!!! WE VIRGINIA RESIDENTS ARE PAYING TOO MUCH ON TAXES FOR DIFFERENT REASONS. THIS ONE WILL NOT BE ONE OF THEM. I WANT YOU ALL TO COME UP WITH A BETTER PLAN FOR ALL MIDDLE CLASS, UPPER COMMUNITIES, AND TAX PAYERS. (0018 0019-1)

Public Comment: An additional tax on my business will have a significant detrimental impact and could well lead to my re-evaluation of the business location I have enjoyed for many years. (0019 0020-1)

Public Comment: As the owner of a small business in the Bowman Green business townhouse section adjacent to the Reston Town Center, I understand that my business is to be levied with a supplementary real estate tax to support the development (maintenance?) of the rail extension. I can categorically state that my business will see no material benefit from this project. My business, a pediatric speech therapy practice, serves a local clientele comprised overwhelmingly of physically impaired infants and young children. Parent and caregivers served by my practice arrive by car from about a ten-mile circumference. For practical reasons involving the physical impairments of their charges, they will not, and arguably could not, avail themselves of the proposed rail link. My suggestion, as a Reston business owner, is that my eventual tax on local business be levied in a manner that it takes into consideration the direct benefit of the transit link to the business. This could include evaluation of employee demographics, i.e., percent of employees commuting from points along the expanded rail system and the businesses proximity to the local rail station; evaluation of customer demographics, i.e., realistic recognition of catchment area; and finally, a threshold related to business size that would determine whether the business is appropriate in size to support an additional tax. (0019 0020-2)

Public Comment: There is potential for overlapping tax districts that would additionally impact commercial property owners in Reston in the future; (0023 0024-3)

Public Comment: [GRCC would support] - A two-phased tax district approach that supports the local funding portion of the rail project while fostering a connection between those who will help pay for rail and those who will directly benefit from the project, to correspond with the phased construction; (0023 0024-7)

Public Comment: [GRCC would support] - Reforming the existing LEADER petition to remove the requirement of the land owners to approve tax district funding for subsequent phases of Dulles Rail. (0023 0024-8)

Public Comment: With regard to the tax district, the proposal is to collect a tax from commercial property owners all the way to Loudoun County to fund Fairfax County's share of building the rail line, while only bringing the rail to Tysons Corner. The plan as it now stands would allow the Tysons Corner commercial property owners, who would be the first and largest beneficiaries of rail, to opt out once phase one was completed. That leaves the commercial property owners along the Dulles corridor holding the financial

bag as it were. They pay all along to fund construction of rail to Tysons and once the Tysons rail is constructed, Tysons property owners can drop out of the tax district, thus shrinking the tax base. This leaves the Dulles corridor property owners, who paid for Tysons rail, with increased property taxes to cover funding for phase two, which is their section of the rail. (0027 0028-2)

Public Comment: This leads to point #2: The Tax District funding mechanism for Fairfax's local share, as presented, is not fair nor equitable. Businesses in Herndon and Reston should not pay 10 years or more in advance to support construction of a rail line for their competitors to use in Tysons Corner. There is no guarantee that Phase 2 would ever be built and no commitment on timing. There are other problems with the flawed petition as well, such as the infamous poison pill provisions that give the majority of the district, controlled by Tysons Corner owners, the ability to back out of the funding for Phase 2. These issues have been well documented in testimony to the Herndon Council, and I will not elaborate again on them here. (0028 0029-2)

Public Comment: To be fair, the funding must be such that people are paying in proportion to their gain. Everybody in the tax district does not gain equally. I ask you to provide a quantitative analysis that identifies who gains and by how much they gain. You can start with my paper, but you must do the analysis and the cost allocation, then report these to the public. (0048 0049-4)

Public Comment: The tax-district funding mechanism for Fairfax's local share as presented is not fair or equitable. Businesses in Herndon and Reston should not pay ten years or more in advance to support construction of a rail line for their competitors to use in the Tysons Corner. There is no guarantee that Phase 2 would ever be built and no commitment on timing. (0028 0064-2)

Public Comment: There are other problems with the tax-district petition as well. Time will not permit me to go into them, but they have been well documented; for example, the infamous poison pill which gives the majority of the district control by Tysons owners the ability to back out of the funding for Phase 2. (0028 0064-3)

Public Comment: A taxing mechanism should be proposed which matches the benefits of safety to the burden of the tax. That is just common sense and good business. (0028 0064-4)

Public Comment: It is our hope and expectation that the tax district supporting Phase 1 will be implemented in time to meet the Federal New Start appropriation schedule in the first quarter of 2004. The Phase 2 tax district may follow within 90 – 120 days following implementation of Phase1. (0113 0132-1)

Public Comment: The vote last week by the Herndon Town Council should be looked at very seriously for its message and not merely as a setback in the rush for federal funding. The uncertainty demonstrated by the town council, the businesses being asked to invest in an extension that won't benefit them yet, and the local citizens is the canary in the mine shaft. (0115 0135-1)

Public Comment: The sponsors of the special tax district have publicly declared that plan "dead." Please explain how the project remains financially viable. (0063 0151-19)

Public Comment: Please explain how the local financial commitment criteria of TEA-21 will be met, given that two recent attempts to raise the local share have failed to gain public support (i.e., sales tax referendum and special tax district). (0063 0151-20)

> ***Response:*** *Section 8.1 of the Final EIS describes the creation of the Fairfax County Dulles Rail Transportation Improvement District as the County source of revenues for its capital funding share of the Wiehle Avenue Extension. As stated in that section, Fairfax County and the landowners group have structured the district to provide sufficient revenues to cover the County's share of costs for the Extension. The tax levy will be only upon commercial and industrial properties within the district. Although payments will not be due until December 2004, on July 1, 2004, Fairfax County began charging commercial landowners an additional 22 cents per $100 of*

assessed value for their properties on top of the base real estate tax rate of $1.13. Fairfax County projects that the tax rate could eventually increase to 29 cents per $100 of assessed value once a Full Funding Grant Agreement is reached. The actual levy will be established each year based on current assessments and the amount of outstanding debt. The district, which had an assessed value of $6.8 billion in June 2004, is expected to generate up to $400 million for the construction of the Wiehle Avenue Extension. If Transportation Improvement District revenues are not sufficient, Fairfax County may consider supporting its capital obligations for the Wiehle Avenue Extension using general obligation debt.

A new landowner's group, called the Western Alliance for Rail to Dulles (WARD), has formed to explore the potential of developing another tax district, similar to the Dulles Rail Transportation Improvement District, which would include properties within Fairfax County west of Wiehle Avenue. WARD has drafted a petition and began circulating it among landowners in July 2004. A determination regarding overlap within the Route 28 tax district would be addressed by WARD and Fairfax County. Property owners within the second district will be able to comment on that district's details during the Fairfax County hearing process.

8.2 Operating Funding Strategy

A. Draft EIS Comments

Regional Agency Comments

Operating Subsidies

Regional Comment: The Commonwealth has a great opportunity to make the Dulles corridor transit a shining example for user-friendly, service-oriented, 21st century transit, with very low, and possibly even zero, subsidy operation. It has been done in other countries, it can be done here. (0133, 0133-T –7)

Response: *With respect to the comment on zero subsidy operation, the Metrorail system and any Metrorail extension operates at a deficit. Section 8.2 of the Final EIS provides the operating costs, revenue and subsidy allocation of the two Build Alternatives.*

Public Comments

Need for More Thorough Financial Analysis

Public Comment: Assessment of financial implications is insufficient. A more comprehensive presentation and assessment of financial analysis is needed. (0510 8-1)

Response: *Chapter 8 of the Final EIS reflects DRPT's preliminary financial plan for the Wiehle Avenue Extension. Section 8.3 of the Final EIS provides an initial discussion of risks and uncertainties. During the project's next phase of preliminary engineering, DRPT will prepare the Extension's final financial plan, which will include an update of the capital cost estimate and a formal risk assessment.*

Operating Subsidies

Public Comment: The projected annual operating subsidy for a rail line to Dulles is $180 million per year. This is five times more than Fairfax County's current transportation subsidy payment. It is also more than the anticipated revenues from the 1/2-penny sales tax increase. To repeat, the revenues from the proposed sales tax hike would not even cover the Dulles Metrorail operating subsidy, much less pay for any other transportation improvements. (0140, 0200-E –1)

Public Comment: The annual operating subsidy for the Dulles metrorail extension would be $180 million

a yr. This is five times more than Fairfax County's current transportation subsidy payment. It is also more than the anticipated revenues of the one-half penny sales tax increase. To repeat, the revenues from the proposed sales tax increase would not even cover the Dulles metro operating subsidy, much less pay for any other transportation improvements. (0140, 0140-T –1)

> ***Response:*** *The subsidy amounts that are presented in Section 8.2 of the Final EIS are in year-of-expenditure dollars, that is, the amounts are inflated to year 2025 dollars. So, it is improper to compare the forecast subsidy of the Full LPA to the current operating assistance of Fairfax County. The sales tax referendum of Fall 2002 failed.*

Public Comment: During the FEIS and rail PE process we need hard work on…Strategies for reducing operating subsidy requirements and making the system profitable. (0173, 0213-M –8)

Public Comment: Believes that harmonized land use, good design, and cost control should enable the 24-mile proposed Metrorail extension to "break even" operationally. Since the Dulles Line will be one of the most heavily used sections of the Metrorail system, attention to user-friendly design, customer service, and fare levels should enable WMATA to recover 100 percent of the operating cost from the farebox. Acknowledges that this comment may be more properly directed to the Commonwealth. (0133 8-1)

> ***Response:*** *With respect to the comment on a profitable system, the Metrorail system and any Metrorail extension operates at a deficit. Section 8.2 of the Final EIS provides the operating costs, revenue and subsidy allocation of the two Build Alternatives. WMATA has recently reduced its operating costs in face of higher deficits.*

Public Comment: As indicated by the following numbers, the subsidy for rail represents a minimal increase over the bus rapid transit return. The Metrorail system has a much higher fair box recovery (75-84 percent) than the bus system (30 percent range). Operating Subsidy. Table 6.3-12 Annual Operations and Maintenance Costs indicated $533.53 million for the baseline, 553.19 for BRT 1 and $601.40 for the T-9 rail alternative or only 7-8 percent higher than BRT. Table 10.19 indicates that O and M Costs per passenger mile in 2025 are nearly identical for BRT 1 $0.264 and T6/9 rail $0.27. Table 10.1-21 The Cost per new rider is $16.62 for BRT 1 and $24.63 for T-9. If the additional riders from the transit-related development in Fairfax County (Loudoun's TOD was not modeled for additional ridership) only are added in the figure for rail is $17.40. It reflects the additional capital and O&M costs to carry each new rider attracted to the regional system. (0141, 0443-E –16)

> ***Response****: The commenter is correct, the operating cost per passenger mile in 2025 for each Build Alternative that was evaluated in the Draft EIS is very similar, as indicated in Chapter 10 of the Draft EIS. The selected LPA is the Metrorail Extension.*

Public Comment: How does the annual operating budget for rail and bus break down, Loudoun vs. Fairfax? I am told that the $21 million BRT and $111 million rail operating budgets are subsidies. Is that correct? (0112, 0382-L –14) (0112, 0462-L –42)

> ***Response****: Tables 8.2-1 and 8.2-2 in the Final EIS present the estimated opening year and forecast year operating subsidies for each WMATA Compact member jurisdiction, including Fairfax County and Loudoun County. For example, in the opening year of the Full LPA, the project's Metrorail operating and maintenance subsidies for Fairfax and Loudoun counties are estimated to be $11.4 million and $8.0 million respectively. The project total operating and maintenance subsidy is allocated to all WMATA Compact members in Virginia, Washington, DC, and Maryland via the formula described in Section 8.2.4 of the Final EIS.*

Operating and Maintenance Costs

Public Comment: Do the operating costs include maintenance of Metro equipment, gasoline for buses, labor costs, etc.? (0112, 0112-E –3)

Response: *The operating and maintenance costs include all costs to operate the bus and/or Metrorail system.*

Public Comment: I also ask you to tone down the annual operating cost estimates without depreciating the quality of the service. Operating costs should be estimated at current cost levels to compare against current fare levels. (0013, 0013-L –3)

Public Comment: That details on operating subsidies and their potential to escalate are sketchy at best. (0446, 0218-M –11) (0446, 0146-T –11)

Response: *The annual operating costs were derived using established WMATA cost models, fare structure, and the results of the operating plan for the Build Alternatives in year-of-expenditure dollars.*

Public Comment: The operating expenses in the early years should not exceed $67 million additional per year for the 71,900 weekday passengers envisioned. (2002 dollar values) The $108 million estimate in the DEIS needs to be restudied and reworked. If the $108 million is correct, it must include existing "tripper" operations between West Falls Church and New Carrollton that will become part of the Dulles operation. It will not be added expense. Approximately 44 cars are now involved in this "pre-Dulles" operation on the Orange Line. Only 100 additional cars will be required (for 71,900 weekday passengers) plus 15 spares and shopping margin. Each added car will cost only $172 per car hour in current dollar values because very little added station and tunnel expense will incurred east of Falls Church. The only added costs will be for rail wear and minimal added wear and tear on existing facilities, plus the additional moving cars. (0013, 0013-L –30)

Response: *The $108 million estimate of the Draft EIS is in year 2010 dollars (not year 2002 dollars), and the cost reduction by using the existing and growing tripper service have been incorporated into the results. The annual operating costs were derived using established WMATA cost models, fare structure, and the results of the operating plan for each Build Alternative in year-of-expenditure dollars.*

Public Comment: How will that money for operating costs be raised and divided among Fairfax and Loudoun? An estimate of Loudoun's share of the operating costs for rail and BRT would be helpful. (0112, 0382-L –15) (0112, 0462-L –43)

Response*: The selected LPA is the Metrorail Extension. Section 8.2 of the Final EIS provides the operating funding strategy for the two Build Alternatives, being the Full LPA constructed in two phases. Fairfax County uses a combination of state aid and general funds for their current share of WMATA Metrorail, Metrobus and MetroAccess programs. Loudoun County has not yet identified their anticipated operating subsidy funding source for the project. The project total operating and maintenance subsidy is allocated to all WMATA compact members in Virginia, Washington, DC, and Maryland via the formula described in Section 8.2 of the Final EIS.*

Public Comment: States that the Project Team needs to explain or correct information about operating costs on Page 24 of the *Public Hearings Report* (Section 3.6). The bus costs appear to be for the shuttle bus service west from West Falls Church to Loudoun County for less than one-minute headway service. (0013 8-2)

Response: *The costs shown in the Draft EIS Public Hearings Report reflect high-capacity, 60-foot articulated BRT vehicles. The headway service is as described in the Transit Operations and Maintenance Plan Draft Technical Report (June 2002).*

Public Comment: Metrorail will need 104 scheduled cars on the extension, but this can be reduced to 88 by turning alternate peak trains back at Herndon to avoid too many empty cars to Loudoun County. The annual future cost of 104 cars may be $72.8 million, not the quoted $106 million. (0013 8-3)

Response: *The four stations west of Herndon-Monroe have high ridership and therefore short turning alternate trains at Herndon-Monroe would hurt this important market of riders and would ultimately lower total ridership on the line because rail service would not be as convenient for Loudoun County riders as under an operating plan where all trains run through. The suggested operating plan would negatively impact an extremely large and important ridership market for the line.*

Escalation of Operating Costs

Public Comment: We will have inflation, but fares will inflate, also. Until fares inflate, we must not inflate costs. Please instruct your estimators to recognize that Dulles Rapid Transit operations between Falls Church and the Anacostia River will be on existing trackage already staffed so added car-miles will come at much lower than average costs. Metro is already operating some of these car-miles, so again, new costs will be less than average. (0013, 0013-L –4)

Response: *Both revenues and operating and maintenance costs are presented in inflation adjusted dollars. The existing Metrorail service between Falls Church and the Anacostia River has been incorporated into the each alternative's operating plan based on WMATA model for operating and maintenance costs.*

Editorial Comment

Public Comment: Cannot find Section 6.9 in the *Public Hearings Report*. (0013 8-1)

Response: *Section 6.9 begins on Page 197 of the Draft EIS Public Hearings Report.*

Concerns Regarding BRT Funding

Public Comment: We also recognize that the assumptions regarding future bus service may be highly unrealistic. We think that it is unlikely that BRT would be implemented as assumed in the DEIS without absorbing significant amounts of funds now used for local and express bus service. This DEIS assumption is particularly unrealistic given the fact that the BRT would be using the same funds (surplus toll road revenues and Fairfax County general revenues) as are now being used for local and express bus service. (0478, 0484-E –8)

Response: *For purposes of analyses in support of the Draft EIS, BRT was considered an extension of the WMATA Adopted Regional System (ARS). It was assumed that the WMATA Compact member jurisdictions, including Fairfax County, would pay the incremental annual subsidy of BRT, according to the Metrorail subsidy allocation formula. Under this assumption, BRT operations would not have been substantially funded from sources presently funding local and express bus service."*

B. Supplemental Draft EIS Comments

State Agency Comments

Need Clear Understanding of Financial Commitments for WMATA Member Jurisdictions

State Comment: Montgomery County believes that the Washington Metropolitan Area Transit Authority Board should address the operating and maintenance cost sharing formula so that all member jurisdictions have a clear understanding of their financial responsibility for both phases of the project. The Dulles Corridor Rapid Transit Project is potentially a 23 mile extension to a 103 mile system for a 22 percent increase In the system size, and this large a system expansion should be thoroughly reviewed by the funding partners at WMATA. Such a review can then be used by all jurisdictions to guide future system expansions. (0079 0092-2)

Response: *In support of the Final EIS, the Project Team, in coordination with WMATA staff, has analyzed the estimated Metrorail operating and maintenance costs, revenues and deficits of the No-Build Alternative, the Full LPA and Wiehle Avenue Extension in the opening year and in the forecast year. The Team allocated the operating deficit among all the Compact member jurisdictions in accordance with the current WMATA formula. Similar information was published in the Draft EIS of June 2002 and Supplemental Draft EIS of October 2003 and in DRPT's preliminary financial plan for the Wiehle Avenue Extension . In addition, the WMATA staff presented the costs, revenues and deficit of the No-Build and Build Alternatives of the Draft EIS to the Planning and Development Committee of the WMATA Board of Directors in March and April 2002 and to the WMATA Jurisdictional Coordinating Committee in March 2002. This information should be sufficient for the Compact member jurisdictions to discuss the Project's financial aspects.*

Public Comments

Fairfax County Share of Operating Assistance

Public Comment: How will Fairfax County pay for its share of the operating deficits projected to be millions of dollars a year? Will other Fairfax County programs be reduced, or will other taxes be increased to cover these deficits? 90038 0039-6)

Response: *Currently, Fairfax County provides funds for Metrorail operating assistance through its General Fund. The Fairfax County Board of Supervisors would be responsible for determining the funding sources that would be used by the County for its portion of the WMATA operating and maintenance subsidy under the WMATA Compact. Additionally, the Commonwealth of Virginia supports WMATA operations with funding from DRPT formula assistance, which is passed to Northern Virginia localities through the Northern Virginia Transportation Commission to support local transit operating needs, including Metrorail subsidies. Specific comments or questions regarding the funding sources used to cover Fairfax County's share of Metrorail operating assistance for the Wiehle Avenue Extension and the Full LPA should be directed to the Fairfax County Board of Supervisors or Fairfax County staff.*

Public Comment: There will be an operating deficit and, if I read the Draft EIS correctly, in Year 1, that will be $9 million. In 2025, that will be $23 million. That is just Fairfax County's share and no one, as yet, has determined where that money will come from. (0062 0070-4)

Response: *As provided in Section 8.2 of the Final EIS, the estimated Fairfax County contribution to the annual incremental Metrorail operating subsidy for the Wiehle Avenue Extension will be $7.5 million in 2011 and $12.6 million in 2025, in year of expenditure dollars. It should be noted that operating costs and subsidy are reported in year of expenditure dollars; therefore, expenditures in later years reflect annual inflation. Specific comments or questions regarding the funding sources used to cover Fairfax County's share of Metrorail operating assistance for the Wiehle Avenue Extension and the Full LPA should be directed to the Fairfax County Board of Supervisors or Fairfax County staff.*

Rail Passenger Fare Levels

Public Comment: A fair funding plan would have the rail riders pay approximately $16 per day, an amount they can afford because they would save that much on automobile and garaging costs. Those owning property near the rail line would not realize excess profits because the fare would be at its fair market value. No new taxes or fees would be required. The system would pay for itself. (0048 0049-2)

Response: *In accordance with WMATA policy, Metrorail fare revenues are set at levels to recover a portion of systemwide operations and maintenance costs, optimize ridership, and provide equitable access to the system for all potential users. For the purpose of NEPA analysis,*

estimated fare revenues, which would cover a portion of the project's operations and maintenance costs, are based on the current fare levels set by the WMATA Board with modest increases approximately every three years. The majority of operating revenues would come from farebox revenues and annual subsidy payments provided by member jurisdictions of the WMATA Compact.

Public Comment: Rail transit can and should open up jobs throughout the region to lower income households and provide those households with lower-cost mobility than the automobile. This social goal can be accomplished by means other than undermining the system's operating efficiency by subsidizing the ticket price. The system in the Dulles Corridor at least should be designed and managed primarily as a transportation system. Service standards and fares should reflect the nature of the market being served and be structured to operate without subsidy. (0108 0127-4)

Response: *Comment noted. Few public transit systems in the U.S. operate without a subsidy. The current Metrorail system averages approximately a 70 percent farebox recovery. For the purpose of NEPA analysis, future fares are the current fares escalated at a rate one-third the rate of inflation. Ridership forecasts incorporate the expected fares in calculating the projected ridership.*

Public Comment: The Dulles Corridor line likely would be among the most heavily used sections of the Metro rail system. Yet in the DEIS, WMATA projected only a 38% recovery of operating cost from the fare box! This does not make sense. (0108 0127-5)

Response: *Few public transit systems in the U.S. operate without a subsidy. The current Metrorail system averages approximately 70 percent farebox recovery. The outer limits of the system will have lower recovery, while the core of the system will have a very high recovery.*

Public Comment: According to a recent article published in the Washington Post, there has been a 0.36% reduction in riders for the Metro system with each 10% fare hike. If Metro's operating budget is funded by money from fareboxes, how will this reduction in ridership affect the operating cost for LPA Phase 1? (0109 0128-17)

Response: *The travel demand forecast model that the Project Team uses for estimating ridership and revenue is sophisticated. It includes the application of regular Metrorail fare increases for the purpose of NEPA analysis and incorporates formulas to address traveler's sensitivity towards the costs of different transportation modes. So, the ridership and revenue forecasts already reflect the effect of fare increases*.

Operating Cost Subsides Required

Public Comment: it would cost $200,000 for each new rider attracted to Dulles Rail. It would be cheaper to buy a car for every driver in the typical Fairfax family. Do you dispute this calculation? (0061 0069-4)

Public Comment: Heavy rail systems such as the proposed Silver Line typically require subsidies, annual subsidies, greater than the average income of the community at the twentieth percentile. Please confirm or deny these figures. (0061 0069-5)

Public Comment: We do not understand the methodology of calculation of cost per new rider. This needs to be explained. (0061 0117-9)

Response: *Using the methodology used by the Federal Transit Administration for New Starts projects, the total cost per passenger is estimated to be approximately $24.73 (in 2004 dollars) per new rider. This is based on total annualized capital and operating costs divided by the number of new transit riders, which is estimated in the travel demand forecasting process.*

Public Comment: The incremental cost of initial operation in Stage or Phase I may be $48.7 million per year, so with 53,600 initial riders, the cost per passenger will be $3.25 for a long ride, for a revenue-to-cost ratio of 81 percent, almost unheard of in public transit. This financial windfall, or lack of substantial deficit, is crucial to the SDEIS and should be so stated. (0054 0055-2)

Public Comment: The public needs to know that the Dulles rail subsidy will be only 24 cents per dollar of passenger fare. (0054 0055-3)

> ***Response:*** *Comment noted. Chapter 10 of the Final EIS includes several comparative measures of cost-effectiveness, including operating cost per passenger mile.*

Public Comment: Heavy rail systems such as the proposed Silver Line have, in other places, required annual subsidies at the level of the gross income at the 20th income percentile of the community. Please confirm or deny this calculation. (0061 0117-5)

> ***Response:*** *The estimated incremental annual operating costs, revenue and subsidy are provided in Section 8.2 of the Final EIS..*

Public Comment: A study done by BART (Bay Area Rapid Transit) in San Francisco indicated that a similar heavy rail system would cost a total of $47,000 per round trip commuter in annual subsidies. Please compare the costs of that proposal (Hayward to San Jose) with the Silver Line projections and indicate any differences that would affect the $47,000 subsidy number (0061 0117-6)

Public Comment: A study done by the Bay Area Rapid Transit in San Francisco indicates that a similar heavy-rail system will cost $47,000 in annual subsidies per round-trip commuter. Please compare the cost of that proposal, Hayward to San Jose, with the Silver Line projections. (0061 0069-10)

> ***Response:*** *There are many ways of calculating subsidy per rider. Without having the methodology used in the BART study referenced by the commenter, it is difficult to provide a "subsidy per commuter" figure for the Dulles Corridor Rapid Transit Project that can be compared accurately to the measures used by BART for the above-referenced project. However using the methodology used by the Federal Transit Administration for New Starts projects, the total cost per passenger is estimated to be approximately $24.73 (in 2004 dollars) per new rider. This is based on total annualized capital and operating costs divided by the number of new transit riders, which is estimated in the travel demand forecasting process.*

Public Comment: Operating Subsidy is grossly understated: The operating subsidy will be far higher than the SDEIS purports, because the lower ridership means lower farebox receipts. (0072 0150-4)

> ***Response:*** *Ridership forecasts were developed using a travel demand forecasting model that is consistent with the Metropolitan Washington Council of Government (MWCOG) model, as well as regionally-adopted land use and demographic data. The annual operating costs and revenues were derived using established WMATA cost models, fare structure, and the results of the operating plan for each alternative in year-of expenditure dollars. Section 8.3 of the Final EIS presents a discussion of the operating cost and revenue risk factors.*

Funding Impacts for WMATA Member Jurisdictions

Public Comment: It is unfair to assess the state of Maryland $6.9 million in yearly operating costs for this LPA Phase I and $0.00 for Loudoun County. I would guesstimate that more Loudoun residents will use the LPA Phase I than Marylanders or D.C. residents, especially when you propose spending $2.8 million a year in "premium bus service" to Loudoun County. (0016 0122-20)

> ***Response:*** *To date, the Northern Virginia Transportation Commission has waived the participation of Loudoun County in the Metrorail subsidy allocation. Otherwise, funding for operations and maintenance of the Metrorail system is governed by the WMATA Compact.*

WMATA Compact jurisdictions contribute to the agency's annual operating budget in accordance with Board-approved Metrorail subsidy allocation formula. Per a WMATA Board of Directors Resolution in year 2000, the operating deficits of an extension (such as the Dulles Corridor Rapid Transit Project) will be allocated among member jurisdictions in accordance with the formula in effect at the time of the extension.

8.3 OTHER FINANCIAL ISSUES

A. Draft EIS Comments

No comments pertaining to this topic were received.

B. Supplemental Draft EIS Comments

Public Comments

Costs for Mitigation Measures

Public Comment: [I]nclude in the project budget post-construction study of the noise, visual and traffic impacts on neighborhoods and contingency funds to pay for additional mitigation if the impact is greater than anticipated. (0026 0067-1)

Public Comment: What are the estimated expected costs and the sources of proffers or funding for connections and mitigations? (0042 0043-8)

Response: *The proposed roadway modifications for station access are not high in number nor in costs. The capital cost methodology for the Final EIS does not include an estimate for each modification but rather uses "top down" method, whereby an order-of-magnitude cost is determined for the modifications. This method was also applied to environmental mitigation measures. ,*

Cost per New Rider

Public Comment: Our calculations are that the cost to remove one car from the road through Dulles Rail is $900,000. Confirm this number or come up with another one. Compare and contrast this $900,000 figure with the $700 per vehicle we estimate it costs to expand the traffic capacity. (0061 0069-3) (0061 0117-3) (0061 0136-4)

Response: *In general, every "new rider" generated by the project could result in one less automobile on the Dulles toll Road or other regional roadways. Using the methodology developed by the Federal Transit Administration for determining the cost per new rider for New Starts projects, the total cost per passenger is approximately $24.73 (in 2004 dollars) per new rider for the Wiehle Avenue Extension. This is based on total annualized capital and operating costs divided by the number of new riders, which is estimated in the travel demand forecasting process.*

9.0 SECONDARY AND CUMULATIVE EFFECTS

9.1 Secondary Development Effects

A. Draft EIS Comments

State Agency Comments

Need for Further Explanation of Environmental Effects

State Comment: Land Use and Socioeconomic - Technical Report (June 2002)*. Page 7 - Purpose - "By providing a high-capacity transportation choice for travelers, the proposed project would be better able to meet the anticipated increases in travel demand, reduce the projected use of existing facilities, and help reduce further congestion in the corridor." This statement would be true if the construction of rail transit in the corridor did not also allow for increased densities. However, the comprehensive plans within the local government provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities, and the anticipated benefits are lost. "Moreover, the ability of the proposed improvements to increase person-moving capacity over long distances with fewer numbers of vehicles, should help minimize future increases in vehicle miles traveled in the corridor and vehicle emissions." This statement would be true if the construction of rail transit in the corridor did not also allow for increased densities. However, the comprehensive plans within the local government provide for higher densities with the introduction of rail transit. Therefore, any reduction in auto travel due to the availability of rail transit is exceeded by the increase in demand resulting from the increased densities, and the anticipated benefits are lost. In addition, because the proposed improvements only provide for increased transit opportunities in only the east-west direction, the increased travel demand in the north-south directions due to the increased densities is not even partially reduced by the proposed construction, again reducing the anticipated benefits. (0421, 0421-A –4)

State Comment: Economics and Secondary Development Effects - Technical Report (June 2002)

- Page 5 - Need - "The projected increase in residents and job opportunities, will result in markedly higher traffic volumes on highways and streets in the Dulles Corridor and throughout the region."
- "Given that the corridor transportation network currently experiences traffic volumes that meet or exceed the capacity of roadways and intersections, causing severe congestion, these increases in traffic volumes are only expected to worsen conditions."
- "Because the existing transit system in the Dulles Corridor operates on the congested roadways described above, it generally offers a poor alternative to auto travel."
- While these are valid considerations, there is no information as to how this impact will be mitigated other than a mention of the increase in rail transit opportunities with the Metro rail Alternative. While it is recognized that rail would provide some mitigation for congested auto travel in the east-west direction, in this instance the increase in land use densities allowed with the provision of rail transit would result in an increase in traffic that is greater than any reduction that which might be provided by rail patronage. Additionally, it should be anticipated that there will be no reduction in congestion, but an increase in congestion, in the north-south direction. (0421, 0421-A –6)

  Response: *Fairfax and Loudoun counties govern land use and have recently conducted extensive comprehensive planning in advent of this Project. As the commenter states, the Fairfax County and Loudoun County comprehensive plans allow more density to occur at the Metrorail station areas, if the Metrorail Extension is funded and built. These policies would provide for higher levels of mixed-use, pedestrian-friendly development in these areas than would otherwise exist without Metrorail in the corridor. The primary intent of these policies is to focus future development into patterns that will increase the number of viable travel options available to corridor residents and employees, including transit, walking, and bicycling. Without the Project, the same level of development would occur in the counties; however, it would be in a dispersed*

pattern of development that is highly auto-oriented, leaving people with few travel choices and resulting in widespread congestion.

The commenter is correct in stating that the increased development in station areas would attract an increased number of vehicle trips; however, this change is consistent with local goals and comprehensive plans. These goals include promoting overall mobility by providing travelers with choices. Even though many people will still use a car in a transit-oriented development, the density allows for the cost-effective provision of other modes at reasonable service frequencies, thus providing people a choice. The clustered development at Metrorail stations in the Dulles Corridor would foster a higher mode split for transit (see Chapter 6 of the Final EIS for an analysis of the effects of the Project on transportation). Moreover, the increase in densities combined with the transit investments, results in a greater number of transit trips, pedestrian trips, and non-single-occupant vehicle trips in the corridor. Therefore, the new, transit-oriented urban form will help to provide a greater number of travel choices, increasing overall mobility in the corridor, the counties, and the region.

The Metrorail extension and related transit improvements will not only provide for increased transit opportunities in the east-west direction. Many of the feeder services that are included, as part of the alternatives would provide improved transit service for north-south travel to and from the station areas as well. Because the planned development would be within walking distance of the new stations, feeder services that connect to the station would also provide access to this development. Moreover, because in many cases the proposed feeder services would operate more frequently than existing transit service, they would provide improved transit opportunities in the north-south direction.

The density increases associated with implementation of the Dulles Corridor Rapid Transit Project also create better opportunities for future transit improvements geared toward this north-south demand. The focused development pattern (rather than a dispersed pattern) creates opportunities for "point-to-point" express services from elsewhere in the corridor. For example, say the new development along the Dulles Toll Road attracts a large number of travelers from the Centreville area. A new express service could be developed that operates from the Centreville Park-and-Ride to the concentrated destinations along the Toll Road. Because the park-and-ride lot concentrates the trip origins at one end, and the focused development concentrates destinations at the other end, the express service can efficiently and cost effectively service multiple origins and destinations. In a dispersed landscape, on the other hand, it is not possible to provide frequent and cost-effective service that serves multiple origins and destinations.

Mitigation for traffic-related impacts around proposed station areas and for long-term effects on traffic in the vicinity of the proposed stations is identified in Chapter 6 of the Final EIS. In addition, as stated in Chapter 9 of the Final EIS, any secondary effects to the built and natural environment resulting from additional station area development would be mitigated through compliance with Fairfax and Loudoun Counties' land use policies and development permitting processes. In the future, the counties may limit development at station areas if necessary to mitigate any associated impacts to the surrounding community.

Local Agency Comments

Consistency Between Transportation and Land Use Planning

Local Comment: The perpetual issue of how to integrate transportation planning with land use planning needs to be looked at more closely than has been done. Put simply, are Metro and Fairfax County repeating the same mistake in putting rail down the median strip of the Dulles access road that they made in putting it down the median strip of I-66? We know that separating the rail line from where people actually live and work, resulting in building a chain of lonely, isolated, ugly parking facilities connected to a metro station, is that the type of development we want for the Dulles corridor? Is the proposed median alignment likely to reduce or increase automobile traffic? The Fairfax County board of supervisors, of

course, last year attempted at least a partial solution to these issues by approving measures to encourage denser development around the metro stations. We applaud the goal. We wonder did they go far enough. (0151, 0151-T –5)

Local Comment: The perpetually mishandled issue of how to integrate transportation planning with land use planning needs to be looked at more closely than it has been. Put simply, are Metro and Fairfax County repeating the same mistake in putting rail down the median strip of the Dulles Access road that they made in putting it down the median strip of I-66? We know that separating the rail line from where people actually live and work resulted in building a chain of lonely, isolated, ugly parking facilities connected to a Metro station. Is that the type of development we want for the Dulles Corridor? (0151, 0297-E –6)

Local Comment: In sum, is there an integrated land use transportation master plan? We would like to see more evidence that the overall impact of the project has been fully considered. (0151, 0151-T –8), (0151, 0297-E –13)

> ***Response:*** *Each locality has adopted land use plans that determine the actual level of development and support transit-oriented development at the Metrorail station areas as a method to integrate land use and transportation. All current land use plans and zoning ordinances were reviewed for the Final EIS, as required. The adopted plans that were assessed as part of this study include: the Fairfax County Transportation Plan; the Fairfax County Comprehensive Plan, as amended; the Loudoun County Countywide Transportation Plan; and the Loudoun County Revised General Plan. In addition, several regional plans and initiatives were also evaluated. Section 1.3 and Section 3.1 of the Final EIS provide a discussion of each of these plans as they relate to this Project.*
>
> *The median of the Dulles International Airport Access Highway (DIAAH) has been studied as a location for rapid transit since that roadway was constructed and the airport dedicated the median for that use. As shown in Figure 1.4-2 of the Final EIS, the major activity centers of Reston, Herndon, and Dulles Corner are bisected by the DIAAH. Local land use plans call for higher-intensity office, retail, and residential development on parcels in the existing and emerging activity centers these areas. Further, past experience with the Metrorail system has demonstrated that transit investment has had positive effects on residential and commercial development near the stations. Chapter 5 of the Final EIS provides a discussion of the station area planning guidelines, characteristics and development potential. Potential impacts to automobile traffic as a result of the Project are presented in Chapter 6.*

Local Comment: While we may be critical of the EIS, we remain firmly committed to public transportation and recognize and accept that it is critical to the elimination of air pollution, minimization of vehicular transportation on city streets and in our neighborhoods. Towards this end, Section 10.3 of the Draft EIS, entitled "Issues to be Resolved," should be amended to include the Falls Church City issues raised herein. (0122, 0122-A –30), (0122, 0164-T –11)

> ***Response:*** *The EIS' fully document the potential significant effects of the No-Build and Build Alternatives. The Project Team initiated meetings with the City of Falls Church during the course of the National Environmental Policy Act (NEPA) process (see Chapter 11 of the Final EIS for specific dates) to more fully understand the concerns and position of the City as they relate to the Project and the EIS' Specific issues raised at the meetings and where they are addressed in the Final EIS are as follows:*
>
> - *Parking – Chapters 3, 4, and 6;*
> - *Pedestrian access and overpasses – Chapter 5*
> - *Land use and development close to the proposed station locations – Chapters 3 5;*
> - *Station location and alignment alternatives – Chapter 2;*
> - *Impacts (e.g. noise levels, pollution, property values, congestion, and crime) – Chapters 3, 4, and 5;*

- *Coordination with other transit studies –Chapters 1 and 3;*
- *Service to Tysons Corner Center – Chapter 2;*
- *Support for and opposition to aerial alignments – Appendix H;*
- *Cost and funding – Chapter 8;*
- *Operational flexibility – Chapter 2;*
- *Enhanced bus service – Chapter 2.*

Public Comments

Need to Plan the Project with a Regional, Long-Term Focus

Public Comment: Likewise, in addition to the many virtues associated with the advent of a sophisticated transit system, there will be additional automobile traffic that must be accommodated. More people clustered in transit impact areas will generate more public health, safety, educational, recreational, and environmental challenges. Public officials must begin to think in terms of an urban life style here, and not just in traditional suburban terms. The transit system can generate many social and economic advantages, but we cannot assume that we can meet the associated challenges with local government business as usual. Let's plan ahead to fully utilize the opportunities created and meet the associated challenges of a more urban community related to a greatly improved transit system. (0088, 0211-M –19)

> ***Response:*** *As part of the NEPA process, impacts associated with safety, recreational, and environmental challenges were addressed in the Draft EIS, Supplemental Draft EIS and Final EIS (see Chapters 3, 4, and 5). Chapter 9 of the Final EIS also presents an analysis of the secondary and cumulative effects of the two Build Alternatives and references the need to provide additional public services if the local governments approve additional development in the Metrorail station areas. Public health was not specifically evaluated in the Final EIS; however, there are air quality standards established in the Federal Clean Air Act to protect public health. Section 4.6 presents the results of an air quality analysis that was completed as part of this Project.*

Secondary Benefits of Project

Public Comment: Secondary travel effects. I should note that in the way back of a traffic study appendix on one of the technical appendices, they did an examination of what having mixed use would do in the Reston area. And when you do that, you can get up to as many as 45 percent more new transit riders. The benefits of mixed use are great. (0141, 0141-T –6)

> ***Response:*** *Comment noted. The Project's ridership forecasts are based on regionally adopted population and employment forecasts for the opening and horizon years. The density bonuses associated with the Metrorail Extension are not part of these regionally adopted forecasts and therefore were not calculated as part of the demand forecasting process for the Supplemental Draft EIS and Final EIS. The impacts of congestion due to density bonuses was included in Chapter 9 of the Draft EIS and the Travel Demand Forecasting Methodology and Results Technical Report (June 2002). Chapter 5 of the Final EIS does present an analysis of the potential effects of increasing densities on the level of development as a result of the two Build Alternatives. The effects of implementing density bonuses in the corridor at Metrorail station areas is also quantified and presented in Table 5.3-1. In addition, density bonuses were included in the analysis of secondary development effects that is presented in Chapter 9 of the Final EIS in relation to traffic. This analysis was included in the Final EIS in order to address comments about the need to quantify the potential effects of increased density on traffic at Metrorail station areas.*

Benefits to Non-Motorized Travel

Public Comment: You are also going to be able to increase the number of walking and bicycling trips overall. This was included into the report. In other words, not just going to the metro station, people will be able to walk to these activities because they are going to be better planned and in close proximity. Now

it's kind of difficult, although Reston is a leader in bicycles and trails, but this kind of development would encourage more of that. (0141, 0167-T –5)

Response: *A discussion of pedestrian and bicycle impacts with regard to station area development is also provided in Chapters 3, 5, and 9 of the Final EIS.*

Station Area Environmental Effects

Public Comment: And eight, transit-oriented land use plans have been adopted by the local governments for all the proposed rail stations, and the traffic impacts were studied for the Tysons and Reston and Herndon plans, and they do not overburden the surrounding roadways. (0144, 0144-T –9)

Response: *The land use plans of each community affected by the Project were assessed and summarized in Chapters 1 and 3 of the Final EIS. In addition, traffic impacts associated with the station areas were addressed in Chapters 6 and 9. Localized traffic congestion is projected at the Metrorail stations areas. The actual level of congestion, though, can be mitigated through the site development process controlled by local government. Mitigation measures for traffic impacts are provided in Chapter 6.*

Public Comment: We have concerns about proposals for as much as 16 million square feet of commercial development at the end statement, what is called Moorefield station. While we support transit-oriented development, this is overkill, given the vast amount of land already available for commercial development, and this amount of office and commercial will prompt sprawl far out to the west. (0251, 0251-T –7)

Response: *The actual level of development and implementation of any site-specific private development opportunities within the corridor is under the control of the local government. The Final EIS provides a general assessment of the potential for development surrounding stations as part of the effort to identify potential effects of the two Build Alternatives.*

Clarification of Tysons Corner

Public Comment: There is a reference in the technical report for economic and secondary development that states that there can be a change in the character at Tysons West, and with all the Tysons alignments. The character of the area is auto-oriented and could convert into the future as many - as more density is allowed, once the transit station's construction. My question to WMATA is, what will be the changed character of Tysons Corner? (0147, 0147-T –6)

Response: *The potential changes in character are described in Chapter 5 of the Final EIS. Land use compatibility and impacts to neighborhoods, community services, and community cohesion in the Tysons Corner area are also discussed in Chapter 3. In addition, the Fairfax County Comprehensive Plan includes language that supports pedestrian and transit-oriented design, including mixed-use developments connected to transit and accessible by foot on a network of sidewalks, trails, plazas, and courtyards and includes provisions for creating improved landscapes and gateways for Tysons. The actual implementation of these plans for the Tysons West area is under the jurisdiction of Fairfax County; it is difficult to project specific changes in relation to specific stations as their ultimate form is dependent on the local government and the development plans that they approve in the future.*

Clarification of Transit-Oriented Development

Public Comment: On page 55 of the same report, it talks about some specific changes and it relates to the dense development, pedestrian amenities and mixed uses. It states that the transit corner could become more transit oriented. I guess my question is or my concern is I would like for it to say "would." On the other hand, does that also mean that it might not become more transit-oriented? We are concerned about the increase in traffic. (0147, 0147-T –7)

Response: *The word "could" was used because the selection of the preferred alternative was pending at the time of the Draft EIS. It is an objective of this Project to provide stations that are compatible with the character of the surrounding neighborhoods and encourage transit use. In addition, density bonuses and transit-oriented development plans are tied to implementation of Metrorail through the core of Tysons. Summaries of area transit-oriented plans assessed as part of the Final EIS are presented in Chapters 1 and 3.*

More Use of Illustrations

Public Comment: We have some concerns about the DEIS. We would like greater attention directed to illustrating, perhaps through alternative development scenarios, the impact of generating greater density near the stations, especially Reston Parkway and Wiehle Avenue. (0188, 0188-T –2) (0188, 0217-M –2)

Response: *The actual implementation of greater densities for the Reston Parkway and Wiehle Avenue station areas is under the jurisdiction of Fairfax County. It is difficult to project specific changes in relation to specific stations, as their ultimate form is dependent on approval by the local jurisdiction. The potential change in development character in the corridor is assessed and quantified in Chapter 5 of the Final EIS.*

Clarification of Non-Motorized Traffic Impacts

Public Comment: Another goal of higher density TOD is to increase the number of walk and bicycle trips. These trips occur independently of transit and are not access to station trips. The analysis shows substantial increases in walk and bicycle trips resulting from concentrated, transit-related development patterns. Walk/bike trips in Reston for work would go from 371 to 819, a 68 percent increase. Total walk/bike trips would increase from 708 to 1,643, a 132 percent increase! (0141, 0443-E –15)

Response*: Comment noted. The data referred to by the commenter are included in Table 22-5, on page 385 of the Traffic Analysis and Station Access Study Technical Report (June 2002). An analysis of transportation effects is also included in Chapter 6 of the Final EIS.*

Need for Further Clarification of Development Assumptions

Public Comment: Following are my comments on the Draft Environmental Impact Statement for Dulles Rail. Since ridership is predicated on increased densities as provided in Amendment No. 2000-01 to the Comprehensive Plan for Fairfax County, these comments are centered around assumptions built into this amendment. More details, including my background, are attached in the Appendix. There is considerable flexibility in the amendment as it relates to redevelopment in Reston, assuming a BRT or rail option. Your DEIS used rail development related forecasts. There needs to be detail supplied as to the specifics used in your assumptions. Maximum density requires a hotel component with neither square footage or room count specified. It also requires a residential component, within limits (for example, 40-75% in the 17 acres closest to the Wiehle Avenue station). Many sub-units permit density increases with the BRT, but not the rail option. Accordingly, questions are:

1. What specific densities for the rail option did you assume for each sub-unit-- office, residential, support/retail, hotel?
2. What specific densities for the BRT option did you assume for each sub-unit-- office, residential, support/retail, hotel?
3. For those sub-units in the Master Plan Amendment that permit higher density for BRT but not for rail, did you assume the Master Plan BRT density for rail?
4. What assumptions did you make about the site coverage -- building and parking structure footprints-- in each case? (0449, 0449-E –1)

Response*: In reviewing the comments submitted, the focus of the analysis presented by the commenter is on the Reston-Herndon area, so these responses will focus on that segment of the corridor and not Tysons Corner or Loudoun County. Density analyses were also conducted for*

these areas, but the methodology varied slightly since the land use regulations vary for each sub-area. The detailed information requested is included in the Appendices for the Land Use and Socioeconomics Technical Report (June 2002) and in the Economics and Secondary Development Effects Technical Report (June 2002).

The Project Team used the specific densities allowed in the comprehensive plan amendment for the Reston-Herndon area and worked from a build-out projection to estimate what percentage of build-out might be achieved. The analysis was general in nature to determine potential effects of growth in the Metrorail station area and did not include a detailed evaluation of the intricacies of the land use regulations, since they are flexible in application. For the Metrorail Alternative the Project Team had used the rail option floor to area ratio (FAR) maximum and then calculated a standard mix of development in terms of office, residential, retail, and hotel development and did not vary by land use. For example, at Wiehle Avenue Station, the Team had applied the rail option 2.5 FAR that is allowed for 17 acres in Sub-Unit G-4. For the BRT Alternative evaluation, the Team had used the lower FAR's, as defined in the comprehensive plan and used the same mix of development. The Project Team had used the BRT level of development for sub-units and then added the rail development totals to the BRT projections to determine the maximum under the Metrorail Alternative. No assumptions were made about site coverage, as this level of detail was not included in the analysis. However, BRT was eliminated from further consideration after the public and interagency review and comment on the Draft EIS

Need for Clarification of Development Assumptions

Public Comment: Most sites are currently fully, or close to fully developed according to previously approved densities. Remaining economic life of the projects thereon may be as much as 40-50 years. It is not likely that these projects can be redeveloped with double or triple present densities without substantial increases in land values sufficient to justify removal of the current improvements. Achieving the highest permitted densities will likely require at least some use of the maximum permitted height of 140 feet (14 stories). Existing buildings are not likely to be sited such that extensive redevelopment could take place and achieve maximum permitted densities without the substantial removal of existing improvements. Several examples of this are:

1. 10 Acres of Sub-Unit D-4 in the Reston Town Center Urban Core closest to transit station, which will permit mixed-use development at an FAR up to 2.0, upon funding for rail. This is essentially developed, including two very new office buildings just opened.
2. Sub-Unit D-6, the Oracle development. This has a currently approved FAR of 0.7 and is currently improved with two of a four building planned project. It may be redeveloped to an FAR of 1.5 for a mixed-use development, with funding for rail.
3. Sub-Unit H-2 permits the 10 acres closest to the rail station to go to an FAR of 1.25 with funding for rail. Eight acres of this are currently improved with Class "A" office buildings dating from the mid- to late 1980s. (0449, 0449-E –2)

Response: *The development analysis, presented in Chapter 5 of the Final EIS, and the secondary development analysis, presented in Chapter 9, used aggressive growth projections to assess what can be viewed as the worst-case scenario. Actual growth may vary, depending on a number of external factors.*

Need for Further Explanation of Development Effects

Public Comment: In addition to physical constraints relating to redevelopment, there are also market constraints. Typically far higher land values will be required to make it economic to remove currently performing office projects. Yet higher land values will, of course, result in the requirement for higher office and residential rents. Question:

1. What full-service office rents did you assume for office redevelopment?
2. What residential rents did you assume for high-rise apartments?
3. What absorption rates for office, hotel, retail/service, and residential redevelopment did you assume going forward from 2002 to 2025? (0449, 0449-E –3)

***Response**: The development analyses conducted in Chapters 5 and 9 of the Final EIS did not contain this level of detail. The development projections were based on the continuation of the positive market conditions within the corridor and predicted that much of the development potential allowed in local comprehensive plans would be achieved. Chapter 5 of the Final EIS describes in detail the methodology used to determine the potential development effects of the two Build Alternatives.*
